THE ROLE OF ARTERIAL OCCLUSION AND ANEXEMIA IN THE CAUSE OF THE CEREBAL DIPLEGIAS*

By HAROLD R. MERWARTH, M D, BROOKLYN, N Y

OUR interest was attracted to prematurity as a possible factor, when in one afternoon's routine dispensary work two cases of cerebral diplegias were examined in both of which the story of prematurity was the outstanding point in the history. Although the fact that in spastic diplegic babies there is frequently a history of prematurity, is well known and although all of us realize it is perhaps an old and "moth eaten" subject, we felt, despite this knowledge, the matter could be introduced without incurring the displeasure of the Gods.

We believe there is partial justification for its discussion in view of the attention given to the entire subject of the cerebral palsies of the newborn, by the presidential address of Collier, the rebuttal by Sachs and the more recent excellent summary of the literature by Ford, all three of whom mention prematurity in some detail with a fair unanimity of opinion as to its importance. This phase is entitled to a review in view of the wide diversity of learned opinion as to the pathogenesis of the cerebral diplegias with "the meningeal hemorrhage" adherents pulling strongly on one end of the rope while the insurgents with equal vigor tug perhaps more successfully at the other end in this tug of war.

This subject is not introduced properly unless one quotes, as is customary, Dr W J Little whose original article had a powerful lens like action in focusing the light of medical opinion on this topic. In the general discussion which followed the presentation of his own paper, Dr Little remarked that he was unable to find "any reference to the affections consequent on abnormal and premature parturition in the works of the English medical writers" and hence he had recourse to Shakespeare with some confidence for such a reference. That he was successful is proven by the following lines, which have been quoted frequently by many writers since Little's time.

> "I that am curtailed of this fair proportion,
> Cheated of feature by dissembling Nature,
> Deformed, unfinished, sent before my time,
> Into this breathing world scarce half made up,
> And that so lamely and unfashionable
> That dogs bark at me as I halt by them."

To Little belongs the credit for the medical application of this literary gem, and when we use theses lines to embellish our paper, to him should due credit be given. We note that prematurity was recognized by the savant Shakespeare as a part of the picture. (Dr Sarah McNutt in her really excellent paper, I found subsequently, had lauded Little for his research.)

If we analyze the material presented by Little we find that in twenty-five of forty-seven cases there was a definite history of prematurity, and in thirteen of these twenty-five cases the only abnormality noted at birth was that of prematurity, while in the remaining eleven there are enumerated such "plus factors" as twinning, difficulty of labor, precipitancy of labor, and trouble in getting the baby to breathe. In his series we can not help but be impressed with the frequency with which the "seven month premature babies had developed a spastic condition and also that in these seven month cases (14 of them) with few exceptions there was no other complicating factor mentioned. In the eighth month prematurity group prematurity alone was reported in seven instances.

In his clinical study "The Cerebral Palsies of Children"—Osler discusses prematurity briefly. Five of the babies born prematurely were seven month babies.

I Infantile hemiplegia
  1 Case at 7 mo
  b 8 mo baby developed a convulsion at the second year followed by a hemiplegia

II Bilateral hemiplegias
  3 cases (Cases 2-3-14) were premature and born at the seventh month

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23, 1928

III Paraplegia

Two cases Case 2 at 8 mo and Case 9 born at seventh month with no instruments

We see that in these seventh month babies prematurity is only mentioned by the author as a cause

Again Sachs in 1890 listed forty-nine cases of cerebral palsies due to congenital cerebral causes Prematurity was cited in four cases—the month was not given In another seven month premature child a dry labor of 48 hours was the complication Frank Ford recently in an analysis of 200 cases of congenital spastic paralysis, found a definite history of prematurity in 66 cases or 33 per cent

Joerg in 1828 is mentioned by Little as "the only author I have met with, who distinctly enunciates that too early and unripe born foetuses present a state of weakness persisting in the muscles until puberty or later"

Brissaud in 1894—argued that premature birth retarded the essential development of the foetus He recognized the frequent association of prematurity with spastic diplegia and became so fascinated with the idea that he advanced the conception of prematurity per se as the direct cause of the condition He advanced an attractive theory based on the development of the pyramidal tracts whereby the extent of spastic involvement is due to the period of prematurity,—the earlier the foetus the greater the involvement This tenet was based on the established development of the pyramidal tracts which grow out from the cortex at the fifth month, reach the medulla at the seventh month of foetal life, the dorsal region at the eighth month and are only completely developed up to about three and one-half years This theory has been supported by Marie, Dejerine and Van Gehuchten

Collier quotes Freud of Vienna as follows (1897) "Premature, precipitate and difficult birth and asphyxia neonatorum are not causal factors in the production of diplegia—they are only associated symptoms of deeper lying influences which have dominated the development of the foetus or the organism of the mother"

Again, Collier in 1899 wrote "When cerebral diplegia occurs in association with premature birth, the two do not stand in causal relationship with one another, but are the concomitant effects of a morbid process affecting both mother and foetus"

Sachs and Hausman in their book "Nervous and Mental Disorders from birth through adolescence," state "From the seventh month on, the foetus is supposed to be viable, but most of these children are far below the normal average in weight, and not a few of them are born with marked spasticity and with symptoms commonly resembling Little's Disease."

It has been well shown by Sachs, Ehrenfest and others that cerebral hemorrhage occurs very frequently in the newborn and particularly the foetuses delivered after difficult labor. Indeed, it has been suggested that such bleeding occurs more frequently than suspected, even in those cases where there is not the slightest suspicion of such bleeding—in the so-called normal cases And particularly in the stillborn foetus have there been evidences of gross hemorrhages Ylppo found evidences of bleeding in 90 per cent of premature infants In almost every paper on this subject we find references to the fact that prematurity favors the tendency to bleed, possibly owing to an abnormal fragility of the vessel walls (Ylppo) and to the thinness of the infant's skull, which predisposes to excessive moulding and hence easier laceration of the susceptible vessels (Ehrenfest)

Thus we see that there is overwhelming evidence concerning the frequency of cerebral hemorrhage as found in the autopsied new born This is granted But as contended by Freud, and supported by Collier and Ford, does it cause the clinical picture of cerebral diplegia?

It is contended by the meningeal hemorrhage adherents that the bleeding over the leg areas of both hemispheres is the fundamental factor responsible for the subsequent clinical picture of cerebral diplegia If bleeding occurs at this site it is admitted that in most every case it is of venous origin, due to the tearing away of the tributary veins from the superior longitudinal sinus, in this manner causing a local bleeding over the extreme superior cortical surface of both hemispheres The arteries are more resistant and not so liable to tear, and while an arterial vessel may occasionally give way, it would be unusual to have bilateral bleeding from this source capable of producing bilaterally symmetrically placed clots, which would exert a pressure over the cortical leg areas

In the new born the bones are more pliable, and all tissues are softer and less resistant, which factors are exaggerated in the premature Does it not seem that these softer tissues could make a ready adjustment to the pressure created by a small localized hemorrhage without damage to the underlying structures? And it must be remembered that in many of the reports of the autopsied new born the blood clots when found have been small It would seem that a hemorrhage of sufficient consequence to cause the permanent destruction of tissue, must of necessity be assumed to be of fairly large size and particularly so in the premature where the very factors predisposing to bleeding such as softness, fragility permit a compensatory adaptation on the part of the brain to such changes And if extensive why so frequently and so sharply limited to the leg area? Are we warranted in the predication of a bilaterally placed hemorrhage as the

cause of cerebral diplegia in the greater number of cases

Also it is not the actual bleeding but the pressure created by the formed blood clot which should be responsible for the damage In the published cases of post mortem material the pia arachnoid is found relatively undisturbed It is difficult to conceive how a pressure sufficiently great to cause cell death and alterations in the underlying tissue should not leave some constant trace in the pia arachnoid A plastering of the meninges should be the rule rather than the exception This point has been raised by Collier

Owing to the fact that the new born babe is a "spinal animal" plus a mid brain, we can not expect immediate demonstrable clinical signs in the form of a paretic leg or a leg of increased tone even if there is pressure exerted over the cortical leg area from a clot It is not until the pyramidal wiring is complete, or the period has arrived when the cortex begins to take over the voluntary functions, that an interference with cortical spinal impulses is evident Since the leg of the new born does not possess a pyramidal "hook-up," whatever disturbance is found must be due to influences acting by way of an older phylogenetic motor system, and this system with its final wiring in the rubro spinal tract would seem to be most easily affected by factors acting directly on the brain stem and cord Such an interference could be effected through downward pressure exerted on the brain stem by large hemorrhages from above, by oedema, and more directly from injuries in the posterior fossa or within the brain stem itself

But as suggested by Ford a supratentorial hemorrhage large enough to cause such signs is usually fatal, and it is probably only the moderate sized hemorrhages which can be withstood by the organism We believe, as we have attempted to show, that it requires more than just a slight hemorrhage to affect the cortex permanently

The hypothesis of intrauterine occlusion of the cerebral vessels to explain some instances of the cerebral diplegias had been put forward by Batten This is a very satisfactory explanation for those cases in which the pathological process had set in before birth

We should like to present a similar concept, the active feature of which occurs during labor rather than during the relatively protected intrauterine life of the foetus, when it seems that the foetal head floating in amniotic fluid can not be subjected to the severe stresses incident to actual birth As has been shown beautifully by Ehrenfest the degree of moulding to which the foetal head is exposed during labor is in many cases extreme and in many instances there is actual over riding of the bony fragments As a result there must be considerable displacement of the intracranial contents, which displacement serves as an explanation for the frequent tearing away of the soft pliable veins from the more re[illegible] dural sinuses Since the cerebral arteries a[illegible] a thicker and firmer calibre, no laceration resu[illegible] but what is equally important there must undoubtedly be considerable torsion and twisting of the smaller vessels and probable compression of the vessels of larger calibre The branches of the internal carotid with somewhat tortuous course arising from a firm fixed base, are very apt to be affected by such factors The anterior cerebral arteries forming part of the leg supply would probably be affected very much by compression, while the middle cerebral artery with an even more twisting course is possibly affected by torsion

As the result of this occlusion an anoxemia of varying degrees may be postulated, affecting of course, the highly developed and more sensitive cells in the neighborhood of the Rolandic fissure We are familiar with the serious results of the clinical experiment of too great a saturation of carbon monoxide in the blood, which fixes the hemoglobin, and causes a relative anoxemia with serious affects on the brain tissue The burden of the damage is on the basal ganglia and the cells of the motor cortex Also the laboratory experiments of Cannon, and that of Pike and Gomez have shown the degrees to which the various nerve cells are able to withstand oxygen deprivation C K Drinker in his recent article on artificial respiration presented the following table

Cerebrum—small pyramidal cells	8 minutes
Cerebellum—Purkinje cells	13 minutes
Medullary centers	20 to 30 minutes
Spinal cord	45 to 60 minutes
Sympathetic ganglion	1 hour
Myenteric plexus	3 hours

In the above we have both clinical and laboratory proof of the extreme susceptibility of the important cells to even slight loss of oxygen supply It seems logical to assume that a torsion or compression of the Sylvian artery as the result of moulding during labor would be sufficient to cause a local anoxemia, severe enough to damage a few of the cells irreparably and in some cases cause a rather extensive involvement

It is in the premature new born infant that an interference with the cerebral arterial supply in the nature of an occluding phenomenon as described, is more apt to occur As has been repeatedly emphasized by many writers the premature foetus is much more liable to the injuries incident to birth, because of its undeveloped condition Just as in the premature there is possibly a greater tendency to venous bleeding because of the susceptible vessels, the thin skull, and the easily moulded head, so its more fragile and more easily compressible arteries are likewise more prone to the effects of torsion and compression

The earlier the foetus, the greater becomes this tendency

After a consideration of the causes of prematurity from an obstetrical point of view, we cannot console ourselves with the thought that the same frost which has bitten the mother has also blighted the child We are of the opinion that the parasitic foetus is fairly independent of the influences which act on the mother to cause prematurity, excepting of course syphilis Even greater difficulty arises in attempting to explain cerebral diplegias, purely on the basis that the child has been ahead of its time, as contended by Brissaud Unless there has been some morbid retarding influence actually affecting the motor cell, we fail to see why its axon should remain undeveloped, simply because the ovum was delivered to the outside world too early It seems more likely that this motor cell through being subjected to oxygen deprivation is only damaged, a condition occurring more easily in the premature

Another well known point of view which had been presented by Collier and which we consider a fairly good one, is that of a primary neuronic degeneration attacking chiefly the cells of the motor cortex Isn't it possible that the fundamental cause of this neuronic degeneration may be a mild cerebral circulatory defect, arterial in fact, which results in an anoxemia of these vulnerable cells early in their development As already noted Batten had offered the concept of an intrauterine occlusion of the cerebral vessels to explain a congenital hemoplegia The word "agenesis" is helpful and covers a wide territory but it does not explain the deeper underlying cause, which may well be that offered by Batten

We suspect that in the case described by Sarah McNutt this modus operandi must be given serious consideration In view of the widely different interpretations placed upon the findings of Wm H Welch in this celebrated case, perhaps it is worth while to present the essential pathological findings in the case of "Elsie M—", once more where all may examine it more closely An abstract of the essential findings only is given

Grossly the left hemisphere showed "Atrophy of the ascending frontal convolution, atrophy of the ascending parietal convolution, atrophy of the paracentral lobule, and possibly atrophy of the first part of the first temporal convolution The right hemisphere was essentially the same

"Everywhere there was edema of the pia, but especially in the fissure of Rolando

"Upon microscopical examination it is found that the cortex in the bottom of the precentral and Rolandic sulci is replaced by a firmly fibrillated tissue rich in nuclei and in corpora amylacea This rim of sclerotic tissue replacing the cortex measures about ½ to 1 mm in thickness—in this tissue no ganglion cells, or nerve fibers are to be seen, and no trace of the different layers of the cortex can be made out In the deeper part of this tissue are blood vessels surrounded by enormously dilated perivascular spaces containing lymphoid cells, large fatty granular cells, corpora amylacea, and in some places, extravasated red blood corpuscles

"The margin of sclerotic tissue can be traced up for a certain distance along the sides of the anterior convolution, and then there appears rather abruptly a cortex two to three mm in thickness, which can be traced over the top of the convolutions where it has its greatest thickness The sclerotic tissue, however, does not disappear, as it can be traced along the deeper parts of this cortex near the junction of the white and the gray matter At the top of the anterior central convolution can be made out in normal succession and of about normal thickness the molecular layer, the layer of small and the layer of large pyramids, and then comes the sclerotic tissue, with its abundant nuclei, fibrous texture, and dilated lymph spaces In following the cortex down the sides of the convolution it is seen that sclerosis invades from the deeper parts more and more of the cortex, the layer of the large pyramids first disappearing, then that of the small pyramids, while the molecular layer, although abnormally rich in nuclei can be traced all of the way down the sides of the convolution *The impression is not that of a sclerosis invading the cortex from the surface, but rather that of invasion from the deeper layers of the cortex and from the medullary substance*

"The ray of white substance included in the anterior central convolution is also sclerosed Nerve fibers, if they exist at all in this white substance are naked axis cylinders In place of the medullary substance is a finely fibrillated tissue, rich in small nuclei, and containing corpora amylacea and dilated perivascular spaces This sclerotic tissue, although similar to that found in the cortex, is less dense and stains less deeply with carmine

"Giant pyramidal ganglion cells cannot be found, even in the gray matter on the top of the convolution where the cortex is best preserved The processes of the ganglion cells of the third layer appear shorter and fewer than normal Still the ganglion cells can be distinctly made out, present their normal triangular shape in section, and appear to be as abundant as usual

"The parts of the posterior central and of the frontal convolutions which have already been described as atrophied present an appearance similar to that described —

"The pia mater over the atrophied parts of the cortex is somewhat thicker than normal and its vessels are distended It is somewhat richer in cells than normal but beyond this presents no marked lesion

"There is a typical bilateral secondary degeneration of the pyramidal tracts —

"There is atrophy of that part of the corpus callosum which may be considered to contain the commissural fibers of the two motor cortical areas The genu, splenium and the posterior half of the corpus callosum are of normal thickness and contrast markedly with the atrophied portion

"The disease is therefore sclerosis of the greater part of the motor cortical area in both hemispheres, with secondary descending degeneration of the pyramidal tracts"

CONCLUSIONS

1 Cerebral diplegia seems to occur in the earlier premature new born than those born later

2 Although venous bleeding occurs with great frequency and can have serious effects, it is contended that arterial occlusion with consequent anoxemia even of brief duration can lead to serious results

3 The conception is presented that it is the arterial occlusion incident to the extreme moulding, which is responsible for the apparent frequency of cerebral diplegias in the premature, and it may serve as an explanation of those cases occurring at full term after severe protracted, difficult labors

UNUSUAL CASES OF MASTOIDITIS WITH SPECIAL REFERENCE TO SINUS THROMBOSIS AND THE SIMPLIFICATION OF OPERATIVE PROCEDURE*

By HAROLD HAYS, M D, F A C S, NEW YORK, N Y

DURING the course of the past two years I have had the opportunity to take care of four unusual cases of acute mastoiditis which, I believe, will prove of interest to you With all the means at our command at the present day, one would think that there would be less likelihood of complications However, no matter how keen we are in our diagnosis, we shall always have certain factors to contend with Chief among these factors are the difference in the resistance of individuals, the difference in the texture of mastoid bones and the virulence of the streptococcus hemolyticus

All four cases occurred in young children between the ages of eight and fourteen years All of the children were apparently healthy before the ear trouble began Three of them returned to normal health, the fourth one died

Case 1 A boy twelve years of age, consulted me with the history that he had had a pain in his left ear for the past twelve hours Examination showed a bulging drum which necessitated immediate paracentesis I advised his going to the hospital for observation The discharge was profuse during the next forty-eight hours The pain in the ear did not subside There was no tenderness over the mastoid bone The temperature rose o 103 degrees Culture of the pus from the canal howed a streptococcus hemolyticus After pending two sleepless nights because of the deep boring pain in the ear, an x-ray picture was taken which showed a cloudiness of the entire left mastoid with considerable breaking down of the cells

He was operated upon at the end of forty-eight hours All the mastoid cells were destroyed and considerable pus was found The sinus and dural plates were hard and, I remarked to my associate, Dr Ayres, that this was a typical, text-book mastoid operation with no exposure of vital parts I told the family that I expected an uneventful recovery

For a few days after the operation, the boy seemed in good condition but his fever did not subside and he continuously complained of the deep boring pain in the left side of his head Examination of the wound and of the ear canal showed nothing of importance On the fourth day, the temperature rose to 104 degrees and remained there for a few days He became drowsy and soon there was evidence of meningeal irritation A lumbar puncture showed a clear fluid under very little pressure The blood count showed 15,000 white blood cells with 85% polymorphonuclears Another otologist was called in consultation who could throw no light on the matter and finally a brain surgeon was called in who gave the family a hopeless prognosis

The boy was getting gradually weaker and was unconscious most of the time On the fifth day after the onset of these serious symptoms, I decided that something had to be done. I took the boy up to the operating room at The Park West Hospital and uncovered the entire wound Nothing could be found there so I decided to uncap the dura and made an opening in the skull measuring one by one and one-half centimetres There was no extreme pressure evident and the dura looked normal Nothing more was done.

The following day the boy looked brighter and gradually the temperature began to subside and the mentality clear up Within five days all of his symptoms had disappeared and he left the hospital completely free of all symptoms at the end of another week His hearing was tested at repeated intervals for some weeks after, until it had come back to normal At this writing (one and one-half years later), the boy is perfect in every way

This case was particularly interesting because

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 22, 1928

of the suddenness with which the mastoid infection developed and because of the subsequent complications It is unusual for a mastoid disease to progress so far in two days to warrant operation In spite of the fact that no dura or sinus was exposed at the time of the original operation, definite signs of meningeal irritation came on shortly after the operation The most significant suggestion to be found is in the fact that all the symptoms cleared up after a second operation was performed and the dura exposed I would be inclined to use the same procedure in future cases There is apparently no rationale in such an operation and yet this is the second case which has recovered after a secondary operation In both of these cases an almost hopeless prognosis had been given

Case 2 On Feb 24th, 1927, I was called to see a doctor's son, twelve years of age The history stated that 24 hours before he had complained of severe pain in his right ear An otologist was called in who immediately incised the drum There was discharge of serum up to the time I saw him The temperature range was from 100-102 degrees On this second day, about noon, the temperature suddenly rose to 104, the boy became drowsy and a left-sided facial paralysis developed

Examination showed the boy semi-comatose, with every evidence of beginning meningitis such as rigidity of the neck, Kernig sign, etc Examination of the ear canal showed a moderate discharge of serum The canal was much narrowed and there was distinct pulsation of the edges of the incision Dr Evan Evans had seen the patient about an hour before, had made a diagnosis of fulminating mastoiditis and had advised immediate operation I agreed with his findings and insisted that the boy be taken to The Park West Hospital at once

Regardless of my warning to the parents that immediate operation was necessary, it was a matter of four to five hours before the patient arrived at the hospital In the meantime, they had attempted to get various opinions from other medical men, one of whom made a diagnosis of pneumonia and advised against operation At eleven o'clock at night, nearly ten hours after the onset of symptoms, the patient arrived at the hospital An x-ray picture of the mastoid processes was taken which revealed complete destruction of the cells of the right mastoid bone Operation was performed at once There was a hard plate over both dura and sinus so neither one was exposed Culture of the pus showed a streptococcus hemolyticus

The following day the patient showed great improvement His mentality cleared and, at the end of a week, his mind was keen and the facial paralysis had disappeared The blood count showed 7200 white blood cells with 62% polymorphonuclears On the third day the temperature rose to 105 For nine days the temperature was irregularly intermittent A blood culture taken on the ninth day showed a few colonies of a streptococcus hemolyticus About this time he began to complain of a pain in his right wrist An abscess over the carpal bones developed which was incised

The question now arose as to whether the blood infection was due to his original process or whether it was due to an infection of the sigmoid sinus Dr I Friesner was called in consultation and a decision was reached to uncap the sinus and ligate the jugular vein

The hard bone over the sinus was removed One could then view a sinus wall which showed a normal color and from which one could obtain a definite pulsation I considered that an exploration of the sinus was uncalled for, for the following reasons

1 The profuse hemorrhage would deplete the patient
2 The convalescence would be considerably prolonged
3 Whatever infection there might be in the vein had caused no definite clot
4 If infected blood could be washed out of the sinus without opening it, much could be gained

I now turned my attention to the jugular vein and resorted to a procedure which, at least with me, is new After the vein had been dissected free, I placed a double ligature of heavy catgut around it below the facial vein and tied the lower suture Before tying the upper suture, I made a nick in the vein and allowed the blood to flow out of it until I felt sure that I had emptied blood out of the sigmoid sinus above I then tightened the ligature, cut between both ligatures and closed the neck wound

After the operation, the temperature remained intermittent up to 102 2 degrees for six days and then gradually returned to normal A blood culture taken two days after operation was sterile The patient was discharged cured very shortly thereafter

There are a number of significant points in this second case to which I desire to call your attention Here was a boy who was in coma when first seen He had a facial paralysis There was a history of an ear inflammation with a slight discharge of serum from the canal The temperature was around 104 One could account for his general symptoms in many ways but, from no point of view could the ear signs be eliminated The best evidence that one could think of other things was that other diagnoses were made One pediatrist made a diagnosis of deep-seated pneumonia It has been my experience that whenever there is a history of an ear discharge, no matter how slight and no matter for how short a time, if intra-cranial symptoms present themselves, the sooner the mastoid pro-

cess is opened up the better In former years, I have reported any number of cases in which the mastoid picture was far from clear Some of these I entitled concealed mastoiditis These were cases in which there had never been any discharge from the ear canal Other cases were those in which the first and sometimes the only signs were those which pointed to intra-cranial irritation A case similar to this was a child whom I saw at three o'clock in the afternoon in a semi-comatose condition and operated upon one hour later The child is healthy and well to-day

When it came to the question of opening up this child's sinus, I brought up the argument that it was possible that the blood stream infection had taken place at the time of the original infection and that possibly it had nothing to do with the mastoid disease My reasons were two-fold, in the first place the onset of the symptoms was so sudden that a blood infection could take place from the throat, the tonsils still being intact, and secondly, the sinus plate was found to be extremely hard at the time of the operation However, I was prevailed upon to uncap the sinus I found it to be of good color and pulsating normally I could see no object in opening up this sinus and exposing the child to a great loss of blood For that reason I resorted to the procedure described above—exposing the jugular vein and, before tying the upper suture, nicking the vein, allowing a certain amount of blood to flow out (2-3 oz) and then tightening the ligature The result was extremely gratifying Within twenty-four hours, the blood stream was free from infection and the child recovered In future cases, I shall abide by my findings as to whether or not I shall open the sinus If it looks and feels normal, if I am inclined to think that I shall be able to wash out any clot that is present by the opening in the jugular vein, I shall leave the sinus alone In the event that the patient's symptoms do not improve as I desire, it will always be easy enough to open up the sinus at a later date without anesthesia I have now had three cases of this type and, under no circumstances do I attribute the death of the last case to this procedure I do not know whether this technic has been tried before or not but it is new as far as I am concerned

Case 3 On May 22nd, 1927, a young boy of 12 years was admitted to The Park West Hospital with the following history He had first had a pain in his right ear one week before A discharge from the canal took place the next day but the pain did not subside His temperature rose to 106 degrees and at times he was chilly I first saw him on admission to the hospital, where, because of the definite subjective and objective symptoms, it was decided to operate upon him at once

An X-ray picture of the mastoid process showed an acute exacerbation of a chronic condition There was no evidence of breaking down of the cells X-ray of the chest showed a consolidation of the lower portion of the upper lobe and a possible suggestion of abscess formation The entire plura was densely clouded There was complete obliteration of the outlines of the diaphragm The heart was displaced to the right The liver and spleen were enlarged

At the time of the mastoid operation, a needle was inserted into the pleural cavity Ten cubic centimetres of bloody fluid were withdrawn which, on culture, was sterile A blood count at this time showed 16,600 white blood cells with 86 per cent polymorphonuclears The temperature on admission was 103

Exploration of the mastoid process showed a thick cortex All the cells were destroyed and the cavity filled with thick pus, which, on culture, showed a streptococcus hemolyticus No dura was exposed but a considerable portion of the sinus was bare of bone and covered with granulations There was good pulsation

The patient's condition was good after operation but, within two days the temperature rose to 107 degrees The following morning the temperature was 100 8 only to rise to 106 6 that night and the following night to 108 degrees This is the highest temperature I have ever seen in a patient who eventually recovered and, strange as it may seem, a few hours later when the temperature went down to 100, the patient was half sitting up in bed reading a book

A blood culture was taken two days after operation This was positive on the second day with a few colonies of streptococcus hemolyticus The blood count rose to 25,800 with 89 per cent of polymorphonuclears

Shortly after the temperature rose to 108, I decided to ligate the jugular vein The sinus as stated previously was partially exposed and covered with granulations Again I did not feel that I was justified in opening the sinus so the usual exposure in the neck was made and treatment of the vein was the same as in the previous case

On the following day the temperature dropped to 99 and was irregularly intermittent for two and one half weeks longer when it went down to normal and the patient was discharged, cured The day after the second operation a second blood culture was taken which was sterile after seventy-two hours

Certain points of interest merit consideration in this case At no time did this boy appear sick enough to warrant our being apprehensive Although the mastoid exenteration showed considerable destruction and the sinus was exposed, there was no reason to suppose that there was a blood stream infection The boy could not be made to complain that he

was ill at any time even when his temperature was very high This is the first time I have ever seen a case in which the temperature rose to over 108 and the patient lived In fact there was no definite collapse after this temperature Here again, exposure of the sinus did not warrant my opening it up Although there had been an exposure of the sinus at the original operation and there was a granulation mass over the sinus wall, still because of the good pulsation and because there was no evidence of a definite clot, I did not feel inclined to open it up After the treatment of the jugular vein as described, the blood stream cleared up in a few days and the patient recovered

Case 4 In the early part of February, 1928, I was called to Amsterdam, N Y, to see the daughter of a physician who was nine years old Briefly the history was as follows A few weeks before she had had an abscess in her right ear which was incised Drainage not being sufficient, it was re-opened a second and a third time A week before I saw her, it was decided to perform a mastoid operation After operation her temperature remained intermittently high A transfusion of citrated blood was given A blood culture showed the streptococcus hemolyticus in the blood stream

Examination showed a moderately emaciated child whose mentality was keen Examination of the eye grounds was negative There was no evidence of meningeal irritation The joints showed no inflammatory process I do not recall the exact blood count but I know the differential count was high There was no question about a blood infection from the mastoid process so immediate exposure of the sinus was resorted to On opening up the mastoid cavity, I found considerable pus beyond the seat of the original infection All disease was removed and an intact sinus plate found However, the sinus was exposed It was found to be normal in color and had distinct pulsation Again I decided that it was unwise to open the sinus and so, the jugular being exposed in the usual way, the same procedure as in the other two cases was resorted to

Two days later the father reported to me that the child was doing well A transfusion of whole blood (400cc) was given and a blood culture made The blood culture was negative In spite of this fact that we had rid the blood stream of the infection I suggested that the sinus be opened up without anesthesia There was a definite flow of blood from the upper end of the sinus showing that no clot had formed

Unfortunately the child continued to get worse and localized abscesses began to form in various parts of the body—wrist, elbow, knee hips, back etc These were opened up as they occurred and we were very much encouraged until an infarct in the lung took place and the child died of a pneumonia about three weeks after the jugular ligation

It is unfortunate that this child had such a severe infection that it was impossible for her to throw it off As I stated in the history, this patient had a number of paracenteses It has been my experience that opening the drum a second or third or fourth time does little good, provided there is a free discharge of pus In any event, no matter how large an incision in the drum is made, only a small opening remains at the end of twenty-four hours The incision can be made to remain open by suction, but, if the symptoms do not subside within a reasonable length of time, the involvement has gone deeply into the mastoid cells so that they will have to be opened Apparently the operation was performed before the dural or the sinus plate had become involved but the child had become considerably devitalized The second point of interest was the ligation of the jugular vein without opening the sinus I had every reason to hope that this would end the trouble particularly when we found the blood stream free from bacteria in a short time The sinus was eventually opened up a few days after the second operation Free blood was found which shows that no clot had formed One might suggest here that tying the jugular vein was not sufficient under such circumstances because the collateral circulation was immediately established and, therefore, bacteria could still emanate from the original source The best answer to this is that the blood was free from infection That the child developed a number of abscesses in various parts of the body was indeed unfortunate, but I believe that she could have recovered from these if pneumonia had not set in

Comments These four cases have many points in common Yet there are certain differences Attention is particularly drawn to the following 1 Apparently simple cases of acute mastoiditis sometime develop symptoms of meningeal irritation which will recover provided immediate operative measures are resorted to In the first case the patient was cured by uncapping an apparently healthy dura In the second case, operation on the mastoid was performed because of the intracranial signs and an attendant slight ear discharge 2 In cases of diagnosed sinus thrombosis, with positive blood culture, cure can be effected by allowing an ounce or two of blood to flow from the vein before ligation, without opening the sinus when inspection and palpation of the sinus show the vein normal in appearance and when there is normal pulsation of the vein 3 In the three cases operated upon in this way, the blood stream was free from bacteria within twenty-four to forty-eight hours

EAR INFECTIONS IN CHILDREN*

By J. E MCASKILL, M D, WATERTOWN, N Y

THE general practitioner today is aware of the prevalence of middle ear inflammation in children and realizes the importance of routine ear examinations in order to arrive at a correct diagnosis

Every pediatrician and almost every general practitioner now carries an electric otoscope in his examining kit

In spite of the increased interest in ear diseases parents yet are told occasionally that they need not worry so long as the child's ear is still running Others are assured that the children will outgrow these periodic ear pains

Otologists agree that a large percentage of the cases of chronic progressive deafness have their origin in preventable causes in childhood However, the relation of ear infection to the general health will be emphasized in this paper

Two years ago after listening to a paper by Dr Lyman[1] of St Louis on Infantile Mastoiditis with Gastro-intestinal Symptoms and hearing the discussion which followed by many of the leading otologists I was firmly convinced that I was overlooking many of these cases Subsequent experience and a review of the literature have prompted me to choose this subject for consideration at this meeting

As far back as 1868 Wreden[2] observed that at autopsy of year-old infants dying of gastro-intestinal disorders and broncho-pneumonia the middle ear and antra showed evidence of infection but considered this condition secondary These observations were confirmed by many others who attributed this finding to the fact that the undeveloped ear of infancy is especially prone to infection in any disorder which reduces the child's normal resistance and interferes with nutrition

Hartman[3] in 1898 was the first to suggest a causal relationship between the two He claimed that digestive disturbances, diarrhea and progressive loss of weight in infants may be brought about by infection in the ears He also found that paracentesis favorably affected the syndrome

In 1921 Renaud[4] of Paris, after examining the middle ear and mastoid antra in seventy consecutive autopsies on infants that had died from a watery diarrhea and finding suppuration in all attempted to do something for this type of case by draining the middle ears and mastoids as he believed the ear infection was the primary cause The report of his excellent results has stimulated investigators in this and many other countries

Dr Marriott,[5] pediatrician of the St Louis Children's Hospital, who has done a great deal of work on this subject, summarizes the pediatric aspect of this syndrome in the following statement "It is now pretty well recognized that the acute nutritional disturbances of infants associated with fever, diarrhea, vomiting and leukocytosis are not the results of a food or alimentary intoxication in the sense that some particular element of the food is at fault With intestinal infections and food poisoning ruled out as factors we are forced to conclude that there must be some general metabolic disturbance or a toxemia of infectious nature Autopsies on these patients reveal no lesions in the gastro-intestinal tract and no infectious foci in locations usually examined"

He goes on to say that since making more complete autopsies on these infants the mastoids have been opened and found filled with purulent material usually containing hemolytic streptococci the toxins of which seem to have a specific action on the gastro-intestinal tract of infants

In 1927 Dr Marriott made the following statement "Within the past year we have found mastoid antrum infections, either at operation or at autopsy in over seventy-five per cent of all cases of severe nutritional and gastro-intestinal disturbances coming to our clinic The regularity with which improvement has followed the operation of post-auricular drainage has served to convince us that mastoid antrum infections are responsible for the conditions mentioned, and not merely a secondary occurrence."

During the past few years I have been making more careful examinations of the ears of all babies with the syndrome of vomiting, diarrhea and rapid dehydration and have found certain signs of middle ear disease which I had previously overlooked To make a thorough examination of a baby's ear is sometimes rather a difficult procedure One needs brilliant illumination, a very small speculum and a magnifying lens The electric otoscope gives a good view or an electric opthalmoscope with a plus eight lens turned on and held close to the speculum also works well The child should be held as nearly immovable as possible and wax and debris wiped out There is no bony canal in an infant's ear and frequently the upper and lower walls are almost in apposition so that the external canal is seen as a narrow slit Therefore the ear should be pulled down and back to straighten out and open up the canal The drum is almost in a continuous line with the posterior superior canal wall

* Read at the meeting of the Fifth District Branch held at Utica, N Y, on October 9 1928

and therefore if the child has a normal drum only the anterior portion shows through the otoscope The part lying posterior to the malleus cannot be seen unless it is bulging and as the bony ring surrounding the drum is incomplete above, any pressure in the mastoid antrum will show as a downward bulge and will simulate a sag of the canal wall Compare the condition with the other ear to make sure it is not an anatomical condition Unfortunately the condition is often bilateral If you look at the drum while the baby is crying and struggling it will usually appear red

Occasionally the ears of these infants show the conventional signs of acute suppuration though in the majority of cases redness and bulging of the drums are not present. The landmarks are still visible There is, however, a change in the color of the drum Instead of the normal lustre it has a dirty gray opaque appearance This may be a part of the dried out condition of the baby due to loss of fluid from vomiting and diarrhea The important finding which is usually present when there is infection in the mastoid antrum is a distinct sagging of the posterior superior canal wall

The difference between the anatomy of the infant's middle ear and appendages and the adult's may partly explain the frequency of otitis media in infants

At birth the middle ear and mastoid antrum are filled with soft mesodermal tissue which as the child grows becomes gradually absorbed and thinned out This tissue is excellent culture media for invading bacteria which are easily forced in from the nasopharynx through the short open eustachian tube when the child sneezes, cries or vomits You will observe that an infant sneezes with the mouth closed tight Other conditions such as the following may account for this prevalence of otitis media in infants The mechanics of birth cause hyperemia and edema of the mucous membrane There may be traumatic injury to the middle ear by the use of forceps in delivery The muscles of deglutition in infants do not seem to coordinate as well as in older children and food is often forced upward into the nasopharynx and out the eustachian tubes, especially if the child is allowed to nurse from the bottle while he is lying on his back Infants suffering from malnutrition and living in unsanitary surroundings seem especially prone to ear infections

There are two distinct types of mastoiditis in infants In one is seen the acute red bulging drum accompanied by severe pain and high fever and ending often in subperiosteal abscess We are all familiar with this type In the other type there is a total absence of local objective symptoms except the gray opaque appearance of the drum and some sagging of the canal wall It is this second type that I wish to emphasize

In these atypical cases of middle ear and mastoid infections in infants a diagnosis depends largely on systemic and focal reactions in other parts of the body and to a lesser extent on focal manifestations Many of these cases go along several weeks before they show serious symptoms because they may be getting partial drainage through the eustachian tubes In others where all drainage is blocked due to the swollen embryonal tissue the onset may be quite abrupt with high fever, leukocytosis, vomiting, watery diarrhea and rapid loss of weight

This type of case is often diagnosed intestinal colic or cholera infantum and feeding changes begin A colicky baby will usually get some relief from warm food in the stomach but the otitis baby cries during and immediately after feeding because the act of swallowing increases the pressure in the middle ear The grandmother's catnip tea gives no relief The regulation of his diet and the administration of enemas are of no avail but when relief is obtained from putting a few drops of warm glycerine in the ear or from a myringotomy we are persuaded to make a diagnosis of otitis media

The cry of these babies is usually shrill, his sleep is restless and he wakens frequently with a jerk The hands fly up over the head which he rolls from side to side He will brush his ears and occasionally poke his finger into the canal Crying is usually increased when the affected ear is manipulated but warmth to the ear seems to give him some relief A sudden noise from the telephone or the dropping of articles will cause him to jump in his sleep The mother complains that the child is suffering from nervousness which he has inherited from his father In some severe cases there may be convulsions and retraction of the head and the physician is led to make a diagnosis of meningitis Yet when you study the ears there is very little to see except a dull gray drum and some sagging of the canal As previously stated these infections are usually bilateral and you are not able to make comparisons with the normal side The X-ray in mastoiditis in infants is of little help because there is seldom bone change but rather an infection of soft embryonal tissue

Bacteriological investigations have shown that this type of mastoiditis is usually due to the streptococcus hemolyticus, therefore repeated red blood cell counts and the estimation of the hemoglobin are of diagnostic aid With the above mentioned clinical picture a daily decrease in the red blood cell count and in the percentage of hemoglobin points to

acute ear infection The white blood cell count and differential furnishes us with a diagnostic as well as a prognostic aid

With the many laboratory aids now at our command we are apt to overlook the most valuable point, that is the general appearance of the patient The infant looks very, very sick and as you watch him from time to time you are impressed by his behavior that the lesion is in the head and not in the abdomen Common sense and good clinical judgment are more important in diagnosing these cases than laboratory data

I do not desire to give the impression that all cases of gastro-intestinal disturbances in infants are due to infections in the ear or that all ear infections cause gastro-intestinal symptoms but I am convinced that this type of case forms a distinct clinical entity, the treatment of which is surgical and not dietetic

The closest cooperation between the pediatrician and otologist is essential in studying these cases In taking time to make a differential diagnosis the physician does not endanger the patient Such a course may reveal involvement of other structures to account for the clinical picture Before operating we should be sure the septic temperature is not caused by a pyelitis, endocarditis, a central pneumonia or infection in the upper air passages

This paper is limited to the consideration of cases in which the focus of infection is in the ear but if any nose and throat infection is also present (and it frequently is) it should be treated at the same time or we cannot expect good results

In a few of these cases the gastro-intestinal symptoms will subside after a free myringotomy but as the discharge is thick and ropy it is difficult to obtain adaquate drainage through the drum incision and the following day will usually reveal a sagging canal again If no discharge at all follows an incision in the drum we should not consider the middle ear and antrum negative as the embryonal tissue may completely block the drainage

If the child continues very toxic and we do not get good drainage through the drum incision the antrum should be opened without delay This is not a serious operation and should not require more than ten or fifteen minutes as the antrum is really the only mastoid cell in infants The disease is actually an antrum empyema This cavity lies very near the surface, being covered by a soft thin shell of bone which is easily removed by a hand curette. The contents is cleaned out and a rubber drain inserted One must be especially gentle of course as the plate of bone between the antrum and brain is quite thin and soft. Sutures are seldom necessary and a dry dressing is applied

If the child s condition is very bad and especially if there is some respiratory infection this operation can be done under local anesthesia with comparatively little or no shock to the patient

The pediatric care of these patients after operation is very important They are suffering from malnutrition and therefore a proper diet is essential Cod liver oil seems indicated and carefully regulated sun baths are helpful If the red blood cell count is low blood transfusion should be given This is quite easily administered through the anterior fontanelle

I should like to give a brief summary of one case J M, age 17 months was seen March 10th, 1928, in consultation with Dr Hawkins and the family physician, Dr Hollis, who gave the following history child had just recovered from a severe attack of pneumonia The temperature became normal March 7th and had continued so for two days The chest became clear and the child seemed to be improving satisfactorily On March 10th a sudden rise in temperature occurred with convulsions, vomiting and distended abdomen

Physical examination —Child appears extremely ill, temperature 104, very restless, constantly picks at face and ears while awake, chest normal, nose and throat normal, abdomen distended but no diarrhea, no rigidity, eye grounds normal, ear drums pink and slight bulging

A bilateral myringotomy was done at this examination Some serosanguinous fluid exuded Ears did not continue to discharge. March 12th condition worse, admitted to hospital, physical examination same as above plus marked twitching of hands and some rigidity of the neck and limbs A lumbar puncture revealed clear fluid, cells 24, slight increase in sugar, urine normal, ears dry and openings closed, lardmarks visible, no edema, no sagging of the canal wall Myringotomy was repeated No discharge followed Condition rapidly grew worse with more convulsions, vomiting and distention Child was quite emaciated and eyeballs sunken We were impressed from the child's actions that the lesion was in the head and felt it would not add to the risk to at least open one mastoid This was done and found filled with purulent material The other was then quickly opened and the same condition was met Following the operation the temperature promptly returned to normal The convulsions and vomiting ceased and abdomen became flat. The child made rapid improvement until discharged on the fifteenth postoperative day with both mastoids completely healed

Conclusions

(1) The mastoid antrum in infants is frequently a seat of infection The usual mastoid symptoms may be absent but gastro-intestinal and meningeal symptoms may be marked

(2) While the gelatinous embryonal material filling the antrum and middle ear is undergoing degeneration this cavity is less resistant to infection, especially in malnutrition infants

(3) The eustachian tube in infants is much shorter and more open than in later life, making secretion from the nasopharynx enter more easily

(4) The syndrome of high fever, vomiting, diarrhea, rapid loss in weight and leukocytosis should warrant a careful ear examination

(5) Routine examinations of all infants' ears should be made to keep constantly prepared to notice the pathological conditions

(6) The study of these cases requires the close cooperation of the general practitioner and the otologist taking into consideration the general condition of the patient and the ear picture from day to day

ANALYSIS OF THE MORTALITY FIGURES OF THE WILLARD PARKER HOSPITAL FOR THE YEARS 1922-1927 INCLUSIVE*

By SHIRLEY W WYNNE, M D, HEALTH COMMISSIONER, CITY OF NEW YORK

In the latter part of 1923, the reorganization of the Health Department Hospitals was begun Since service to the patient is the "raison d'etre" of the Hospital, the readiest and most trustworthy measure of its efficiency in the discharge of that responsibility is the mortality among its patients

In 1922, at Willard Parker Hospital, the general mortality was 16 7, in 1927, it was reduced to 7.3, a reduction of 56 3 per cent

Table I

Mortality, All Services Combined

	Cases	Deaths	Mortality %
1922	4409	737	16 7
1923	3402	284	8 3
1924	3320	361	10 8
1925	3380	314	9.2
1926	3013	294	9 7
1927	3323	244	7 3

Had the rate of 1922 prevailed in 1927, there would have been 556 deaths instead of 244 There were, therefore, 312 lives saved during the year as a result of improved service to the patients

Many patients are brought to the Hospital as a last recourse, in these cases the prognosis on admission is always grave, 1927, 144 deaths occurred within 48 hours whereas 100 deaths occurred after 48 hours

During the few years under consideration, the mortality of diphtheria at Willard Parker Hospital fell from 18 1 to 8 1, a reduction of 55 2 per cent which represents an actual saving of 144 lives

Table II

Diphtheria

	Cases	Deaths	Mortality %
1922	1650	299	18 1
1923	1122	135	12 0
1924	1132	151	13 3
1925	1273	188	14 7
1926	1142	107	9 3
1927	1588	143	8 1

Improvement in the treatment of laryngeal diphtheria "croups" by suction has been responsible in large measure for the reduction in the death rate of the diphtheria service In 1922, 234 patients were intubated, 14 2 per cent of the total cases treated In 1927, 72 cases were intubated, or 4 5 per cent of the total cases of diphtheria on the service Not only were the number and percentage of intubations reduced, but the mortality among those intubated was lower to even a greater degree In 1922, 126 of the patients intubated died, equivalent to a fatality rate of 54 0 per cent as com-

*Read before the Medical Board of the Willard Parker Hospital at a meeting held on February 28, 1928

pared with 16 6 per cent in 1927 when but 12 children died

TABLE III

Intubation

	Intubated	Deaths	Percentage
1922	234	126	54 0
1923	132	54	40 9
1924	165	59	35 8
1925	150	51	34 0
1926	112	28	25 0
1927	72	12	16 6

The reduction in the number intubated and the number that died tells only a part of the story In previous years, not a few of the children who were intubated and recovered became "chronic tubes," that is, after the diphtheria was cured, the tube could not be removed from the larynx because of the damage done by the disease and the tube The children were then destined, according to the practice at that time in vogue, to spend the remainder of their lives within the confines of the hospital When the reorganization of the hospitals was undertaken, there were 54 of these unfortunate children doomed to permanent hospitalization All of them have been permanently cured and returned to their homes to resume normal lives

The social problem of adjusting these youngsters, who had spent their lives from early childhood in a hospital ward, to their homes was no less difficult than curing them

A record that we are even more proud of is that in the last three years not one "chronic tube" has developed as a result of intubation at Willard Parker Hospital

Measles is usually thought of as one of the minor contagious diseases, but at the contagious disease hospital, this is not the experience, for it is attended by the highest mortality of all the more common contagious diseases, because of the age and condition of the children admitted Most of them are under three years and all have developed some complication before coming to the hospital

In 1922, the fatality of measles at Willard Parker Hospital was 22 4 as compared with 10 4 in 1926 and 9 0 in 1927 In 1925, a non-epidemic year, the rate was brought down to 6.2, the lowest on record

TABLE IV

Measles

	Cases	Deaths	Mortality Per Cent
1922	1,158	260	22 4
1923	676	74	10 9
1924	948	102	10 7
1925	660	41	6.2
1926	1,098	115	10 4
1927	220	20	9 0

If the fatality rate of 1922 had prevailed in 1926, there would have been 246 deaths as compared with 115, a saving, therefore of 131 lives

The fatality of scarlet fever has been reduced to almost one fourth of what it was in 1922

In that year, there were 895 cases treated with 75 deaths, equivalent to a rate of 8 3 In 1927, there were 936 cases treated with but 22 deaths or 2 3 per cent *

TABLE V

Scarlet Fever

	Cases	Deaths	Mortality Per Cent
1922	895	75	8 3
1923	588	28	4 7
1924	527	11	2 0
1925	772	15	1 9
1926	384	14	3 6
1927	936	22	2 3

*This reduction in mortality has been largely influenced by the use of serum in the treatment of the severe cases.

PERFORATED GASTRODUODENAL ULCERS*

By RALPH COLP, M D., NEW YORK

THE literature abounds with innumerable studies of ulcers of the stomach and duodenum from one standpoint or another, and yet it might be interesting to report twenty consecutive cases of perforated ulcers admitted to an emergency hospital in a large metropolitan area These cases, although the number is small, illustrate several poignant facts which are not universally recognized, and correct several empiric impressions which do not appear to have any scientific foundation

All these cases occurred in males The youngest sufferer was twenty-two, the oldest sixty-four, the average being thirty-nine years of age Of this number, forty-two per cent were foreign born

As far as a previous ulcer history was concerned, ninety per cent had one In fact a third of the cases gave a story of stomach symptoms dating over five years, and some as long as twelve years A small percentage suffered gastric pain for over two months, and only a few described their complaints as practically recent in origin The antecedent symp-

* From the Surgical Service of the Beekman Street Hospital New York N Y

toms were the well known ulcer symptoms of indigestion, pain after meals, vomiting, acid eructations and epigastric distress, although great variations existed in the periodicity and rhythmicity of the usual ulcer cycle

The acute symptoms, however, were sudden in onset in eighty-five per cent, occuring while working in three, and after eating in four There is no doubt that sudden physical effort or distention of a stomach are potent factors in causing a sudden rupture of a penetrating ulcer The onset in over half of the cases was ushered in by a pronounced epigastric, knife-like pain, agonizing and stabbing in character, and in only one was the pain of an indefinite nature

The pain was localized to the epigastrium in eighty per cent, in three it was generalized over the entire abdomen, and in only one was it localized to the right lower quadrant. Radiation of the pain was not characteristic, and was present only in four instances, once over clavicles, once to the right lower quadrant, once to the back and shoulders, and once to the back alone Nausea and vomiting were not at all constant, and their absence which occurred in fifty per cent of the patients can never be used as evidence pointing against the sudden rupture of an ulcer

Physical examination as a rule was quite characteristic Invariably these patients were shocked, they appeared pale, with cold, clammy skin, and the pulse was slow, and the respirations slightly acclerated The abdomen was scaphoid, moving but little with respiration, and, as a rule, the patient lay flat on his back absolutely motionless, with the thighs flexed

Abdominal rigidity which was present in all patients was described as "board-like" in eighty per cent, and in seventeen cases, it involved the entire abdomen In a third of the cases, the liver dullness was obliterated but in one-third of the cases it was not mentioned The obliteration of liver dullness when present is pathognomonic of intraperitoneal perforation, but it must not be confused with the tympany occasioned by a distended colon If the liver dullness is percussed in the mid-axillary line, this error will not occur Abdominal tenderness was present in all cases, in eight, it existed over the entire abdomen, in nine it was confined to the epigastrium, in only two was it most pronounced over the right upper quadrant, and in one, it was most marked over McBurney's point This tenderness was present from the onset in ninety per cent, and only developed later in two cases

The rectal examination gives but little information in the first eight hours unless there has been sufficient leaking of intestinal contents along the right lumbar gutter or elsewhere to accumulate in the pelvis, then tenderness in the rectal pouch might be added evidence of a peritonitis

The blood count was extremely valuable confirmatory evidence of intraperitoneal irritation for in this series with a normal temperature and pulse, the count averaged between 14 to 15,000, with a relatively increased polymorphonuclear leucocytosis

In the one case in which there was difficulty in the diagonsis of an acute surgical abdomen, the fluroscope was used to determine the presence of free air in the peritoneal cavity There is no denying the efficacy of this additional diagnostic procedure, but the absence of a rim of air under the diaphragm is not proof positive that a perforation is absent There is no need for routine x-ray examination for these patients are sufficiently shocked without the additional strain of transport to an x-ray laboratory, or the energy expended in taking a plate at the bed side

The initial temperature, pulse and respiration on admission showed little change, the highest temperature was 100 3 F, the lowest 96 1 F, and the average 98 5 F The pulse averaged around eighty-three This, after a few hours, increased in rate in fourteen cases, together with a slight increase in temperature This slow pulse was probably due to intense reflex vagal stimulation The average respiratory rate was twenty-two

The diagnosis, as a rule, presented no great difficulty In this series, it was made in fourteen cases In three, acute appendicitis, and in three acute cholecystitis, were diagnosed

All these cases were operated upon as soon after admission as was practical The average time elapsing between the onset of symptoms and operation was about eight hours, the shortest was about one hour and a half, and the longest thirty-seven hours General anesthesia, gas and oxygen was employed in all but one case, in which spinal was used

The abdomen was invariably explored through an upper right rectus incision The surgical pathology observed was always about the same Free fluid was present in all cases, and gas in the great majority The fluid was of a greenish mucoid variety, occasionally bile stained, and often containing food particles No difficulty was encountered in locating the perforation It was found most commonly in the region of the pylorus, sixty-three per cent were gastric perforations, and thirty-one per cent duodenal The exact location is given in Table No 1 The perforation varied from 1 m m to 20 m m, the average diameter was 4 6 m m Induration about the perforation was mentioned as being present in fifteen cases, and stated definitely as being absent in two, the average area of induration measured about 2 5 c m in diameter Although multiple per-

forations were always looked for, none was found in this series

Local peritonitis was present in ten cases Eight cases presented a general peritonitis, and in two no peritonitis, either local or general, was evident

The surgical procedure employed at the Beekman Street Hospital, which is really an emergency hospital, was the simplest procedure possible, namely, suture of the perforation In fact, it is strongly felt that the surgery of any acute surgical emergency should always be the simplest, the least shocking and time consuming operation which will answer the purpose

The ulcer was simply closed by suture in twenty cases, either purse string, mattress or figure of eight In nine cases, the omentum, and in one case the gall bladder, was sutured to the closed perforation as an added precaution against leakage

TABLE NO 1

Location of perforation According to the anatomical regions of the stomach and duodenum, the perforations were found as follows

1	Cardia	None
2	Fundus	2 Cases
3	Pylorus	10 Cases
4	Gastroduodenal Juncture	1 Case
5	First portion of duodenum	6 Cases
6	Second portion of duodenum	None
7	Third portion of duodenum	None

This makes twelve perforations of gastric ulcers or 63 1 per cent. 1 at the juncture of stomach and duodenum and 6 in the duodenum or 31 6 per cent.

Further delineation of the locations is as follows

1	Anterior fundus	2 Cases
2	Anterior pylorus	5 Cases
3	Lesser curvature of pylorus	1 Case
4	Superior anterior pylorus	1 Case
5	Inferior anterior pylorus	1 Case
6	Superior posterior pylorus	2 Cases
7	Gastroduodenal juncture	1 Case
8	Anterior duodenum I	2 Cases
9	Superior duodenum I	1 Case
10	Anterior superior duodenum I	1 Case
11	Posterior superior duodenum I	2 Cases

In spite of its short comings, and the fact that some surgical clinics report as many as fifty per cent of ulcer recurrences after this procedure, simple suture of the perforation still remains a sane and rational emergency procedure for acute perforations of either the stomach or the duodenum The dangers of an adequately closed perforation reopening, if not combined with gastroenterostomy, and the danger of an acute gastric obstruction due to stenosis of the pylorus and duodenum incident to the infolding of the ulcer, have been grossly exaggerated They have never occurred in this series, and in the experience of others, they have always been exceptionally rare post operative complications

For years there has been an incessant campaign on the part of some ardent enthusiasts to combine the simple procedure of suture of the perforation with gastroenterostomy, but as time has passed, a mass of evidence has accumulated showing that gastroenterostomy as an emergency measure is unnecessary, and as a prophylactic procedure it fails to protect against the recurrence of subsequent gastroduodenal ulceration Moreover, gastroenterostomy often complicates the future picture with the appearance of a gastrojejunal ulceration

Nor can a subtotal gastric resection even in selected cases, be looked upon with favor as an emergency operation in spite of the glowing reports from European clinics which advocate this procedure For, all these patients have a potential peritonitis and even though it is largely chemical, it does not appear to be sane surgical judgment to open up new avenues of contamination, and to increase the shock by performing such a major operation In fact, the last word has not been written on this procedure either Time will probably curb the enthusiasm for this as it did for gastroenterostomy, which not so long ago was hailed as the panacea for all gastric and duodenal ills

At present, a wave of enthusiasm is engulfing the Horsley pylorplasty for acute duodenal perforations This is a commendable procedure, but sufficient time has not elapsed to determine whether this will be justified by future follow-up reports

Drainage was not employed in any of these cases This is a direct variance with the policy adopted in several large clinics in which intraperitoneal drainage regardless of time of perforation, is routinely employed There is no doubt that if some of these perforations were seen at a late period when localized subhepatic collections were present, that a tube may have been inserted Ordinarily, however, it is felt that the peritoneum can handle this type of peritonitis quite effectively, and that the drainage tube may often create difficulties which might have been obviated Certainly no untoward results occurred which may have been attributed directly to lack of intraperitoneal drainage, although the abdominal wall became infected in nine cases In retrospect drainage of the skin and subcutaneous tissues might have been good surgical procedure, and some of the abscesses in the abdominal incision might have been avoided Fortunately none of the infections were severe

The post operative care was that used after any gastric operation After the first two days, these patients were placed upon either a Lenhartz diet or modification because it was felt that the perforated ulcer was but an expression of "ulcer tendency" and that the usual papillary gastritis was present

The post operative course with the exception of wound infection was uneventful in all but two cases The average hospital stay was about twenty days

Death occurred in two patients making a mortality of ten per cent These cases are herewith given in detail

Case No 1 Male, 32 years of age, a chauffeur, who gave the history of slight abdominal pains and indigestion for one week prior to the onset of sudden epigastric pain which occurred while he was walking home The patient called in his private physician, who ordered vigorous massage of the abdomen This was carried out while the patient experienced excruciating pain in the epigastrium, which radiated as shooting pains to the back and shoulders He was finally sent to the hospital nine and a half hours after the onset of his symptoms

Upon arrival, the patient was in shock, the entire abdomen was board-like, more marked on the right side, which was also more tender The liver dullness was obliterated Temperature, 99 2, pulse 72, respiration, 22 The leucocyte count was 18,000, with ninety-four per cent of polymorphonuclear leucocytes

The patient was operated immediately Free gas and gastric contents were found on opening the peritoneum The perforation was 3 m m in diameter with 2 c m induration surrounding it, and located on the anterior surface of the pylorus There was a marked diffuse spreading peritonitis No drainage was used

Following operation, the patient did not do well, but presented the signs of a spreading peritonitis and wound infection In spite of blood transfusions and other treatment, he succumbed five days later with a temperature of 106 F

Case No 2 Male, 32 years of age, a salesman, who gave a history of nausea, vomiting and belching of gas after meals for several years For past weeks the pain had become worse, and one hour prior to admission there was a sudden onset of acute abdominal pain which caused the patient to collapse He was brought to the hospital by ambulance

On examination, the patient was in slight shock, but his general appearance was that of a poor operative risk He had a definite mitral stenosis There was board-like rigidity of the entire abdomen, with tenderness most marked in the epigastrium The liver dullness was partially obliterated Temperature, 99, pulse, 84, and respiration, 24

Spinal anesthesia was used An upper right rectus incision was made A small amount of free fluid was found in the peritoneal cavity, a perforation of 2 m m in diameter on the anterior surface of the pylorus was closed over by double inversion purse string suture, the peritoneum washed with hot saline, 500 cc of which was allowed to remain No drainage was instituted

The day following operation, the patient became dyspnoea and cyanotic and x-ray of the chest revealed a massive collapse of the lower lobe of the left lung In spite of treatment, the patient died that evening

Post-mortem showed the collapse of left lung and local peritonitis The sutured perforation was intact

---

THE TREATMENT OF HEART DECOMPENSATION

By MEYER A. RABINOWITZ, M D, BROOKLYN, N Y

THE treatment of heart decompensation will in a measure vary with the etiological factor or factors Among the causes for left ventricular insufficiency are hypertension of no matter what causation, ascending aorta disease, disease of the left coronary artery, either at its ostium or branches, myocarditis of infectious origin, myofibrosis cordis, and aortic valvular defects Among the causes of right heart failure are late left heart failure, mitral valvular defects, chronic pulmonary disease—particularly emphysema, chronic fibroid tuberculosis, bronchiectasis, chronic bronchitis, chronic adhesive pleurisy, acute penumothorax, pulmonary embolism, right coronary disease, and tricuspid valve disease Chronic mediastino-pericarditis, is truly speaking not a cardiac decompensation as the stasis is dependent upon narrowing of the blood vessels entering the heart

Absolute bed rest should be ordered only after the most careful consideration Bed rest should not be advised in so-called heart cases where the patient is suffering from nervousness, extrasystoles, respiratory cardiac arrythmia, in toxic arrythmia the result of digitalization in nervous hearts, or when the patient presents an unimportant murmur Bed rest should never be too long in aged individuals Strict bed rest however, is to be ordered even in mild cases of cardiac decompensation The effect of bed rest on the restoration of compensation serves as a gauge of the severity of the condition With the use of bed rest, if the

condition is not urgent, digitalis may not at all be necessary in cases of cardiac decompensation due to strain of the heart muscle However, if the symptoms do not promptly clear up after a few days rest in bed, digitalis may then be ordered The patient, after a complete rest in bed, should be allowed up very gradually and in that way the period of rest may be protracted without antagonizing the patient—by first allowing the patient the privilege of sitting up with her feet out of bed for increasing periods, and later on resting on the couch or reclining chair or out on the sun porch The doctor should observe for himself the effects of this upon the patient's color, pulse regularity and particularly the respiration An increase of the pulse rate is not necessarily to be accepted as a sign of overstrain Where the above are well borne the patient may be allowed increased periods of these minor activities If these are well borne without dyspnea, pallor, or irregular heart action and the patient's temperature has been normal when taken rectally three times daily for a period of over a week, we may then gradually increase the number of hours that the patient is allowed out of bed However, from time to time, it is important that the patient shall take naps and rests during the day, days of complete rest in bed and short vacations of complete mental and physical relaxation

It is well not to go into extreme detail with the patient with reference to his cardiac status and particularly should the doctor be warned from telling the patient the x-ray findings and blood pressure readings The duties of the patient's occupation should be restricted within his limits of cardiac reserve Causes of overstrain, nervous distress, excitement, irritability and anxiety are to be avoided The patient is not to enter upon any new enterprises He should be ordered sufficient exercise As a rule the patient takes too little rather than too much The high grade mitral stenosis case knows her own limitations The individual with aortic regurgitation should reduce his activities, as the heart always works intensely and he therefore does not get discomfort with increased effort In the presence of a compensated valvular defect in a child, no overstrain, such as climbing, rowing or swimming should be allowed He may, however, indulge in skating, and in mild tennis Ortel exercises may be allowed in the relatively healthy and obese, when the latter is the result of overfeeding, excessive alcoholism or insufficient exercise Intensive walks may be allowed in neurotic cardiacs, young individuals with hypoplastic hearts, or vasomotor disturbances Moderate exercises in the nature of active and resistive movements may be allowed in the slightly decompensated In the markedly decompensated, passive movements, general massage, and deep breathing exercise will be of value—causing a decrease of cyanosis and dyspnea These deep breathing exercises should consist of slow inspiration and expiration first alone, then with the arms raised front, then with the arms raised to the side, and then with the arms raised up—later on with flexion and extension of the legs These movements are first to be passive with the assistance of the nurse, later active, finally when compensation is restored, with resistive movements

Baths No sweat baths are to be allowed even in the mildly decompensated Carbon dioxide baths may be used in milder decompensation The action however is probably to a large extent psychic Open *air* is of value In the badly decompensated, open air sun porches are of distinct psychotherapeutic assistance The altitude may be of moderate elevation in the atherosclerotic hypertensives and in compensated valvular defects High altitude is rarely allowable and particularly to be interdicted where vasomotor regulation is inadequate

The diet must be individualized and will vary with the presence of obesity, chronic nephritis, hypertension or chronic pulmonary disease Obesity must be especially combated because of resulting scant diaphragmatic activity and decreased lung ventilation In general it is best to let the patient eat what he likes, avoiding undernutrition, by giving sufficient for the caloric needs The Karell diet is to be used in the presence of great edema and poor diuresis It accomplishes an intake of less nitrogen and water It should, however, never be used for a period over three days 800 to 1000 c c of milk are given in small amounts divided over several portions during the day It is not to be given in emaciated individuals It is of distinct value in the obese If the patient develops flatulency and diarrhea, calcium carbonate should be added to the milk If constipation results, magnesia may be given with the milk Absolute Karell days are usually not necessary It suffices to put the patient on a solid diet with the fluids restricted to 600 to 1000 or 1500 c c of milk or tea If great restriction of solid intake seems advisable Zwieback, rice, milk soup and oatmeal may be given the first few days In the nature of fluids, instead of milk or tea one may give lemonade, sweetened with lactose, cocoa or coffee Coffee or tea are not to be given if they produce palpitation or insomnia Fresh buttermilk and thick soups are useful The amount of fluid allowed will depend entirely upon the balance between the patient's intake and output of fluids Salt should always be restricted We must find the patient's tolerance If the patient exceeds the amount of

salt tolerance, decompensation sets in the more readily Less salt seems always advisable in the presence of hypertension Fat in the nature of milk, butter, cream and egg yolk may be given Proteins are to be reduced if hypertension or kidney insufficiency is present. Cheese, broiled, baked or roasted meat, clams, oysters, rolled beef, mutton, pork, chicken and fish are allowable where the patient may take solid food A diet rich in carbohydrates is particularly valuable and in a somewhat diuretic connection helps digitalis Zweiback, cereal soups, vegetable purees, fruits, pie, sugar, spinach, rhubarb, and vegetables of all kinds are given These vegetables should be well cooked when there is flatulency present A diet of approximately 45 grams of protein, 225 grams of carbohydrate and fats 110 grams is the equivalent of 2100 calories and is usually sufficient In the undernourished the caloric intake may be raised to 3000 grams when compensation has been restored However, one must avoid overfeeding It is best to give small frequent meals in order to avoid distention of the stomach and pushing up of the diaphragm The heartiest meal is best given at breakfast in the early half of the day Less should be given after dinner and least toward evening Tobacco is best left out altogether The alcohol is to be stopped Where the individual refuses to stop his tobacco and alcohol it is best to tell him that he has heart disease in order to make him realize the necessity of obeying the given orders

Digitalis acting drugs Digitalis should first be given by mouth The standardized tincture, digitan tablets of 1½ grains each, digifoline solution, verodigen (Boehringer) tablets of 1/75 grain each, are best for internal use Digitan tablets are equivalent to 15mms of the tincture or digifoline solution When giving digitalis it is best to determine how much the patient will approximately require in order to obtain full digitalization As a rule 2 minims of the tincture per pound of body weight is the required amount If there has been no previous giving of digitalis and very rapid digitalization is imperative, the initial dose should be one half of the total amount, then one quarter of the initial dose may be given four hours later with the remaining quarter dose in four hours In this way one may obtain very rapid digitalization without running great risks, or one may give one half of the total dose and then give one half teaspoonful every two or three hours until the symptoms of digitalis toxicity, such as slow pulse, irregular pulse, decreased urine, headache, visual disturbances, nausea or vomiting arise. When compensation is established and no symptom of digitalis toxicity has arisen, it is well to give the digitalis for one more day, then stop and wait until the pulse is slightly weaker and more rapid, and then begin with a reduced dose *At least* 7½ to 15 grains of the powdered digitalis is to be given during the period of a month If liver stasis is marked, digitalis by mouth will very frequently fail In these cases it is best given either by suppository or injection hypodermically or intravenously

Where immediate digitalization is neither necessary nor advisable, verodigen, 1/50 or 25th of a grain may be given four times a day, or standardized powdered digitalis 1½ grains one to three times a day It is best to avoid hypodermics as they are apt to result in harm by causing marked excitement Where there is a tendency to edema the suppositories may be combined with theobromine or theophylline or euphyllin

In the presence of insomnia the evening dose may contain 1/12 to 1/6 grain morphine hydrochloride or sulphate One should be particularly careful in the giving of digitalis preparations intravenously, if there has been a previous use of the drug by mouth or rectum or hypodermically

We may class cardiac decompensation into several stages The first stage when rest in bed is sufficient, second stage, when digitalis by mouth proves efficacious, third stage, when digitalis by hypodermic injection or suppository becomes necessary, the fourth stage, when compensation can only be restored by the use of strophanthin intravenously, and the fifth and final stage, when all treatment fails and the patient can be said to be partially dead Strophanthin intravenously becomes our final sheet anchor One must start with very small test doses to see how the patient tolerates the drug and responds to it The giving of Coramin or Cardiazol at the same time either by mouth or intravenously renders the giving of strophanthin much less dangerous and one can accomplish splendid results with smaller and therefore safer doses One may begin with ¼ mgm and two Cardiazol tablets by mouth or one or two Cardiazol ampules intravenously at the same time This should be done daily for three or four days Then, if the case is severe, one may increase it to ½ mgm every second or third day If further stimulation appears necessary one may give ¾ mgm daily and may even increase the dosage and give it at more frequent intervals It is a bad sign if one must increase the dose and shorten the intervals One should try to gradually increase the intervals to see if one can manage without the development of signs of stasis Strophanthin when given together with calcium chloride, 5 to 10 cc. of 10% solution intravenously, very slowly, has proven of

decided advantage Strophanthin, however, is best not given in the presence of aortic regurgitation, aortitis or severe arteriosclerosis

Squill in the form of the 4½ grain doses of the bulb, or the tincture, or best as Scillaren tablets or ampules of one c c may be added to digitalis, if digitalis fails These may substitute digitalis from time to time in the chronic use of digitalis It is also of advantage in those cases where the pulse rate is slow or when one does not wish to prolong the diastole, as occurs in aortic regurgitation Intravenous injections of 10 c c of 10% calcium solution may supply nutriment necessary for the combustion of heart muscle, and slow the heart rate Cymarin has been advised but the writer has had no personal experience with it Caffein may be given to advantage where there is a tendency to bradycardia and may be combined with theobromine

Drugs acting upon the vaso-motor apparatus are of distinct value in the presence of cardiac failure In the more excessive doses it has a tendency to whip up the heart which later becomes the more readily exhausted Camphor is of decided value in myocardial disease, when one wishes to influence the respiratory centers, or when digitalis fails Camphor-like drugs increase the effects of digitalis and strophanthin and render it safe and useful to use small doses of these Camphor triturate ¼-grain with quinine hydrochloride ½-grain and digitan ¼-grain may be given in the form of pills, one or two pills at a time, three times a day If nausea or anorexia arises this may be given by rectal suppository Coramine and Cardiazol are camphor-like acting preparations which have proven of decided value and are indicated in myocardial weakness of sepsis, arteriosclerosis and chronic cases where digitalis fails Coramine may be given intramuscularly or intravenously, 1 to 2 c c three to five times a day or 20 minims several times daily by mouth Cardiazol may be given one or two tablets at a time by mouth or in solution intravenously or subcutaneously Adrenalin by mouth is advised but is of questionable effect Adrenalin injections are of value in diphtheritic myocarditis to raise the blood pressure It may be given intravenously in acute cardiac decompensation However, it is not to be used in the presence of hypertension as it may increase or produce heart failure There is a growing tendency to use the adrenalin-like acting Ephedrin, which may be given by mouth or hypodermically and has the advantage of being slowly absorbed, therefore capable of more prolonged action Pituitrin may be used to advantage in diphtheritic myocarditis to raise the blood pressure and is of value in peritonitis where the pulse is poor and intestinal paresis is present. Strychnine 1/60 to 1/20 by hypodermic injection is useful Caffein is of decided advantage, especially in myocardial disease and when the pulse rate is slow It is best given in small doses There is a great tendency to give it in large doses which probably has a very harmful effect on the patient When necessary to be given hypodermically, caffein sodium benzoate 3 grains every four hours in sufficient Caffein by mouth, 1 to 2 grains to those not heavy coffee or tea drinkers, will prove useful

Diuretics are best given after the heart mobilizes the edema fluid and are indicated in all conditions of dropsy due to myocardial insufficiency One should watch the daily intake and output, restrict the amount of fluid intake and put the patient to absolute rest in bed The purin group because of their great tendency to produce cerebral blood vessel dilatation may result in poor sleep or insomnia In that event, the evening dose should be omitted and it may be necessary to try another type of diuretic during the day *Caffein* 1 or 2 grains by mouth,—caffein sodium salicylate four grains hypodermically, *theobromine* in doses of 10 to 15 grains three times a day, or theobromine sodium-salicylate 7½ to 12½ grains three times a day may be tried for several days, then given twice a day and finally once a day over a long period of time Large doses of the above should not be given over a long period of time because they have a tendency to exhaust the kidney and cause a failure of response when needed *Theobromine sodium-acetate* (Agurin) 7½ to 15 grains three to six times a day is of value. *Euphyllin* 5 grains three times daily is of great value at times to prepare for digitalis action. It is of decided value after digitalis or strophanthin has been given It is particularly to be tried when the patient vomits *Theocin* (pure Theophyllin) may be given in the form of rectal suppositories of 5 grains every morning Because of the danger of toxic symptoms the dosage should not exceed 12 grains a day, and best given every 2nd day only Theocin sodium-acetate may be given by mouth in the form of three grain doses One is not to exceed giving 22 grains in two days The above purin drugs may be given by enema but because they may prove very irritating are best combined with 5 to 10 minims tincture opium to prevent rectal irritation

The *mercurials* are excellent diuretics but require careful watching of the bowels for signs of colitis which may be very severe or hemorrhagic, and marked gingivitis The latter may be avoided by the use of a potassium chlorate gargle as a prophylactic

Mecurials may be given in the form of calomel, 3 grains three times a day for four days with small doses of opium in order to avoid a

cathartic effect on the bowels, or in the form of blue mass one grain three times a day after meals for three to six doses, or Salyrgan, 1 or 2 c c every third or fourth day best given intravenously as it has a tendency to cause necrosis when given by hypodermic injection Novasurol is the most potent of all the mercurials and therefore, the most dangerous, requiring the greatest care in its administration It is excellent to pump out the water where the heart cannot mobilize water It should be given in 1 to 2 c c doses intramuscularly—never over two injections weekly, when there is persistent edema

Urea in tremendously large daily doses of 225 to 450 grains in 5 ounces water may prove of value Thyroid may prove of distinctive value in cases of edema whether or not there is obesity, proving better, however, when obesity is present

Acid therapy may prove of distinct diuretic effect The giving of dilute hydrochloric acid 25 minims three times a day, or large doses of calcium salts, or ammonium chloride 15 grains in capsules six times daily for several days are of value, but these are best avoided if there is associated renal insufficiency Potassium salts in the form of potassium acetate 30 grains three times a day may be given to advantage occasionally in the interval between the use of stronger and more potent diuretics Sweats and pilocarpin are contraindicated If the individual shows a tremendous edema of his legs and the usual therapy is of no avail, incisions down to the fascial layer may prove of distinct advantage The use of Southey tubes is to be condemned as infection may result. In order to avoid infection and secondary erysipelas in the incised areas it is best to apply mercury plaster for twenty-four hours on the washed skin of the legs, then after incising through the mercury-covered skin, covering these incisions with the same ointment and a sterile bandage

Glucose intravenously is insufficiently used and is at times of great advantage in the cases of acute and chronic myocardial weakness, whether the result of diphtheria, sepsis, marked hemorrhages, beginning myodegeneratio cordis, coronary sclerosis with resulting myofibrosis cordis, or insufficiency of valvular defects, and may be life saving in cases of pulmonary edema It supplies combustion material to the heart and is of great assistance in the use of digitalis It may be used together with small doses of insulin to further a proper utilization of the glucose It is important to give it in concentrated solutions Ill results following the use of glucose are due to the introduction of large quantities of fluid into the circulation and the added strain on a badly damaged heart It is best given very slowly intravenously in the amount of 10 to 20 c c. of a 35 to 50 per cent solution Infiltration outside the vein must be scrupulously guarded against as very marked irritation will result

Venesection is at times a life-saving procedure in acute pulmonary edema and in the cases of cor pulmanum (the result of chronic pulmonary disease) with persistent right heart failure accompanied by marked orthopnea, cyanosis, swollen liver and distended jugular veins Morphine, tincture opium, pantopon, dionine or codeine may be needed in cases of severe decompensation Morphine should be given in the form of a small dose hypodermically or suppository at night to insure good sleep Under proper circumstances a small dose of morphine with its resultant sleep may be worth a carload of digitalis The opiates are to be avoided if they produce vomiting, when Cheyne-Stokes respiration is present, or if there is associated lung insufficiency, such as very marked bronchitis or broncho-pneumonia or marked pulmonary stasis Particularly must care be exerted when given together with digitalis in cases of preponderant left ventricular hypertrophy, in which event severe vomiting may result If the digitalis is stopped it may be possible to give large doses of morphine without ill effect The reason for this is unknown Disturbances of this nature do not occur when there is preponderant right ventricular hypertrophy Doses of morphine hydrochloride by suppository will vary from 1/6 to 1/12 of a grain If morphine seems absolutely indicated, the ill effects of it may be avoided by the simultaneous use of Coramine already described

Dry or wet cupping, particularly to the chest, may be of value in cardiac decompensation complicating chronic glomerular nephritis or arteriolar nephrosclerosis with contracted kidneys and hypertension Six leeches applied to the precordium may be of distinct advantage where there are cases of right and left ventricular hyperthrophy and dilatation Six leeches applied over the liver where there is marked liver enlargement and associated tenderness or Head zone will be found of distinct advantage This action is supposed to depend mainly upon a reflex relaxation of the spasm of the unstriped muscle fibre in the hepatic veins

The Talma operation has been advised in cases of marked cardiac cirrhosis and said to have been followed by a decrease of the edema, ascites and the size of the liver

Symptomatic Treatment Anorexia may have to be combated by rectal medication Very frequently very small quantities of food of alternating taste given every hour may be of distinct advantage,—such as giving a salty food as cold meat, an hour later sweet foods as chocolate, cake, sugar or lactose and an

hour later something sour such as egg yolk with lemon *Constipation* in the obese, plethoric and those with right heart weakness will require the use of saline cathartics, such as magnesium sulphate, sodium sulphate or sodium phosphate Magnesium sulphate one dram is combined with an equal amount of potassium bitartrate and given in a half a glass of water on arising every day If weakness is produced, the saline cathartics should be given every second or third day only If the patient's cough is troublesome it is best to avoid the use of morphine Digitalis will often prove sufficient If the expectoration is viscid in chronic bronchitis, small doses of potassium iodide with tincture hyoscyamus or tincture belladonna, and ammonium carbonate will prove of advantage If the patient presents marked *flatulency,* saline laxatives, restriction of carbohydrates, particularly of raw fruit and raw vegetables are indicated Symptomatically, spirits of anise 4 minims with milk of magnesia, up to a teaspoonful every quarter to half hour may be given A half teaspoon of aromatic spirits of ammonia and elixir ammonium eg valerianate, may be given every quarter to one hour as needed

The *dyspnea* is best combated by giving of digitalis or strophanthin, camphor, coramine and Cardiazol, or glucose—10 to 20 c c of a 35 to 50% solution intravenously, oxygen if there is associated lung insufficiency, chloral hydrate in small doses, or nitroglycerin 1/100th of grain three times daily Catharsis is indicated if there is marked renal insufficiency Paracentesis of the chest may be necessary in the presence of persistent hydrothorax causing dyspnea An ice bag to the precordium may allay dyspnea attended with anxiety Morphine 1/6th grain in rectal suppository or hypodermic injection in the evening is of the greatest advantage provided there is not any associated lung insufficiency In the event of the latter, the patient will spend an even more restless night The same applies for the use of opiates or pantpon Morphine and the like are best used when full digitalization has been accomplished and the respiratory centre is not suffering from anoxemia

It is important during the first few nights of treatment for decompensation to secure excellent *sleep* As has already been said, a well slept night after a hypodermic injection of a small dose of morphine is frequently better than a carload full of digitalis Morphine is often the only safe narcotic As has already been stated, 1/6-grain at bedtime by hypodermic injection or suppository, gradually increased to a maximum ¼th grain may prove of great value There is very little danger of oliguria if there is not a marked renal insufficiency Morphine, however, is never to be used in the presence of Chyne-Stokes or irregular respiration or where there is lung insufficiency One must be on the alert to see that caffein, purin derivatives, coffee or tea are not the real causes of the insomnia, or that the insomnia is not the result of the patient's worrying about the financial or domestic conditions at home Often a few kind words on the part of the doctor or nurse or a little assistance given by the social service department of the hospital or dispensary will prove the best hypnotic The nasal passages should be kept free More fluids should be given in the obese if they are thirsty because they do not drink enough, provided there is no excessive edema Chloral may be used where there is hypertension Veronal is, as a rule, dangerous to the heart and will often produce a very poor reaction Sulphonal may be given in doses of 20 grains in hot milk, but is not to be given over more than three successive nights

Anemia is to be combatted by the use of liver, small doses of arsenic and iron The latter may be given as reduced iron, iron and quinine citrate, the elixer of iron, quinine and strychnine phosphate It is most important to combat *obesity* The use of saline cathartics to relieve portal and intestinal stasis and thus get rid of the gas with its resultant intestinal distention, lifting up of the left diaphragm, and interference with the heart action is of extreme importance A reduction of fats, carbohydrates, fluid and salt is indicated Thyroid may be given in large doses in those cases associated with cardiac insufficiency associated with hypothyroidism In all other cases it is to be used with extreme caution *Palpitation* of the heart should be combatted by local use of an ice bag, cantharides blister, or mustard paste The evening meal should be light, laxatives given from time to time to empty the bowels, the use of tobacco stopped and occasional doses of sodium bromide and aromatic spirits of amonia Belladonna, aconite, digitalis and morphine may prove of value

Acute pulmonary edema when fully developed requires most energetic treatment. The patient is to be sat up with the legs out of bed and venesection of 400-500cc done at once, whether hypertension or hypotension is present This is to be followed at once by strophanthin in sufficient dosage intravenously Oxygen inhalations, a hypodermic injection of ¼-grain morphine with 1/50-grain of atropin, gluucose 10-20c c of 35-50% solution intravenously may be used in addition and will, as a rule, bring about a remarkable improvement within half an hour If necessary some of the above measures may be repeated again the next day One fiftieth-grain nitroglycerin

at the very onset of the attack if hypertension is present may prove abortive Calcium chloride 5 to 10 c c of a 10% solution injected very slowly intravenously has proven of decided value Giving 1 c c of pituitrin by hypodermic injection to avoid mobilization of latent edema or giving 1 c c novasurol intravenously to produce diuresis of mobilized fluid will be at times indicated The prevention of attacks of pulmonary edema consists of a previous avoidance of heart strain, restricting fluid intake toward evening, sleeping with the legs out of bed, and giving small doses of nitroglycerin before any untoward effort in the presence of hypertension In the event of cardiac insufficiency due to *coronary closure,* a hypodermic injection of ¼-grain of morphine, repeated in twenty minutes if there is no relief, may be absolutely necessary Adrenalin should not be given A small dose of nitroglycerine 1/100th or 1/200th-grain may relieve the pressure in the aorta or coronary vessel above the point of closure Intravenous injection of a concentrated solution of glucose is advisable Quinine has been recommended in acute insufficiency resulting in these cases but the writer has had no experience with it and would advise caution in its use Theobromine in large doses, or euphyllin intravenously or in the form of rectal suppositories is of decided advantage in dilating the collateral coronary circulation In the event of marked stasis or rapid irregular heart action, small doses of digitalis or strophanthin may be necessary

THE RELATION OF ALLERGY TO SCARLET FEVER*

By FRANKLIN A STEVENS, M D , and A R DOCHEZ, M D , NEW YORK, N Y

The hypothesis that the rash and some of the acute symptoms in scarlatina are allergic has been advanced in the last few years Before the streptococcus was proven to be the cause of the disease, references occurred in the literature pointing out the implications of such an hypothesis Authors (1, 2, 3) with wide clinical experience believed that the rash and fever were reactions to the products of hemolytic streptococcus in individuals who had been previously sensitized to this microoganism This belief was founded on two facts First, hemolytic streptococcus was found in the throat in practically all instances of scarlatina during the acute stage of the angina Second, a similarity was observed between the symptoms of scarlet fever and those observed in disease known to be allergic

According to this hypothesis, scarlet fever might be likened to a disease such as hay fever An individual after frequent exposure to pollens or dust becomes sensitized Subsequent to this sensitization, explosive allergic reactions occur on exposure to the pollen or sensitizing substance In applying the hypothesis to scarlatina, it is necessary to assume that frequent inconsequential exposures to streptococcus result in sensitization to soluble products of the bacterium In sensitized individuals a subsequent severe infection would result in an allergic cutaneous reaction accompanied by fever In a sense, the exanthem might be considered similar to certain eczemas in infants due to food sensitization or rashes due to hypersusceptibility to drugs In 1923, Bristol (1) summarized the literature relevant to this hypothesis and attempted to prove the idea adequate by a series of cutaneous tests with streptococcus His results were only suggestive. In view of more recent observations, the substance with which he worked probably did not contain the fraction responsible for the acute symptomatology For this reason, it is not surprising that his results were inconclusive

Interest in scarlet fever was reawakened in 1923 by the production of a serum of distinct therapeutic value Attempts were also made to immunize persons with filtrates of cultures of hemolytic streptococcus obtained from scarlet fever A therapeutic streptococcal serum had previously been prepared by Moser (4) and transient immunization had been successfully accomplished with streptococcus vaccines by Gabritschevsky (5) This work was subsequently overlooked largely on account of adverse criticism and because a satisfactory explanation of the action of the serum and the vaccine was not immediately forthcoming The successful use of the serum developed by Dochez (6) in 1923, and the demonstration of a toxic substance capable of causing cutaneous reactions by Dick and Dick (7) in our opinion firmly established the streptococcus as the cause of scarlatina Observations with this antitoxin and the toxic substance discovered in filtrates of cultures of streptococcus at first afforded an apparently satisfactory explanation of the disease on previously recognized immuno logic principles

When filtrates of strains of streptococcus recovered from the throat were injected into the skin a reaction occurred resembling the Schick reaction with diphtheria toxin. This reaction was positive in only a small percentage of adults but was obtained in a high percentage of children of the ages when scarlatina is most prevalent. Antitoxin was found in the blood of nearly all adults with negative reactions and their blood serum proved as efficient as the antitoxin prepared by immunizing horses in neutralizing the effect of the toxic substance in the filtrates Serum

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 22 1928.

obtained from persons with negative cutaneous reactions, from persons convalescent from scarlet fever, or from immune horses all blanched the scarlatinal rash equally well Mair (8) had already pointed out the probability that the rash was due to a soluble toxin emanating from the streptococcus in the throat, and that the immunity to the disease was antitoxic The idea that Streptococcus hemolyticus produced a true toxin similar to that of the diphtheria bacillus was at first generally accepted because of the parallelism between the action of the sera and the toxins in the two diseases The immunity to scarlatina enjoyed in infancy as well as the negative reactions occurring with streptococcus filtrate in the newly born were attributed to the transmission of antitoxin from the mother through the placenta The immunity acquired from having had scarlet fever was assumed to be due to antitoxin in the blood Adults and children with negative scarlatinal reactions were believed to have acquired immunity through inconsequential infections with streptococcus All this was in accord with the accepted theory of immunity in diphtheria Discrepancies however soon arose making this explanation untenable

The dissimilarity between diphtheria toxin and the toxic substance of Streptococcus scarlatinae first attracted attention. Diphtheria toxin is readily destroyed by heat, deteriorates rapidly, and is lethal for laboratory animals On the other hand, toxic filtrates of streptococcus resist degrees of heat destructive to true toxins, are extremely stable, and are not harmful to animals except in excessive amounts The only generalized toxic reactions which have occurred in normal animals with unrefined streptococcal filtrates have been observed in man During the immunization of children against scarlatina with streptococcal vaccines, Gabritschevsky noticed rashes, sore throat, vomiting and malaise (5) Recent instances of a similar toxaemia have occurred in the immunization of individuals showing positive cutaneous reactions These instances have followed the injection of culture-filtrate

The second dissimilarity between scarlatina and diphtheria, is the dissimilarity in the relationship between the negative cutaneous reaction and immunity in the two diseases A negative Schick reaction is a reasonably reliable index of immunity to infection with the diphtheria bacillus A negative reaction with scarlatinal streptococcal filtrate on the other hand, is apparently an index of immunity to the scarlatinal rash but not necessarily to throat or other infections with Streptococcus scarlatinae (9) Strains of streptococcus producing characteristic toxic filtrates have been recovered from the throat in instances of severe angina not accompanied by a rash Similar strains have also been found in other infections without an exanthem The throat infections are frequently observed in persons with negative skin reactions and must often be considered scarlatina sine exanthemate

The third and perhaps the most significant point of variance is the observation that newly-born infants almost universally fail to react to the filtrates of scarlatinal streptococcus From the observations of Zingher (10) and of Cooke (11) it is apparent that scarlatinal antitoxin may be transmitted from the mother to her offspring through the placenta Cooke has found that 70 percent of twenty mothers and 40 per cent of their newly-born infants had circulating antitoxin, yet only one percent of 200 infants under six weeks of age were sensitive to two skin tests doses of scarlatinal toxic filtrate From these observations it is evident that the negative cutaneous reactions and the immunity to scarlatina observed during early infancy are not due to circulating antibody Man at birth is apparently insensitive to the toxic substance elaborated by the scarlatinal streptococcus In this respect the Dick and Schick reactions are distinctly unlike Infants at birth frequently react positively with diphtheria toxin and in at least 95 per cent of instances (12) the child's reaction agrees with that of the mother Aside from early infancy, negative Dick reactions are seen only rarely in normal adults having no circulating antitoxin Negative reactions occur commonly however in convalescence from scarlet fever where the reaction is negative after the rash disappears but before antitoxin can be demonstrated in the blood

In view of these three gross discrepancies, the idea that the mechanism of the immunity and symptoms of scarlatina and diphtheria are identical must be discarded An alternative hypothesis must be substituted and the one most suitably fitting the circumstances is one based on allergy The essentials of this hypothesis have already been stated From clinical observation and experimentation we believe that the toxic substance in the filtrates is not a toxin but an allergin We prefer to call it a tox-allergin, because it is apparently only toxic mildly to animals and individuals who have not previously been sensitized The hypothetical course of events occurring during the life of man would be as follows:

Three definite periods occur in this sequence First is the period of insensitivity in early infancy The infant is not yet sensitized to the streptococcus, so reacts negatively to cutaneous injections of the tox-allergin and is insusceptible to the rash of scarlatina. With exposure to the streptococcus sensitization occurs resulting in the appearance of positive skin reactions and a susceptibility to the rash in event of infection with Streptococcus scarlatinae Appreciable amounts of circulating antibody are not found at this time Later, due either to repeated mild infections with streptococcus, to absorption of toxin streptococcus carried habitually in the tonsils or to an attack of scarlet fever, antitoxin appears in the blood

The cutaneous reactions then become negative and the individual is immune to the toxic substance produced by the streptococcus This hypothesis apparently satisfies all the known clinical observations

The hypothesis is also supported by laboratory evidence The three stages occurring in man can be duplicated in animals (13) Normal rabbits rarely react to toxic filtrates of cultures of hemolytic streptococcus yet positive skin reactions can be obtained after the animals have been sensitized by the intracutaneous injection of filtrate These reactions can be prevented if the filtrate is neutralized by the addition of scarlatinal immune serum If injections of filtrate are continued the sensitized animals are apparently desensitized because the skin sensitivity disappears before antitoxin appears in the blood Intravenous injections of filtrate may desensitize them immediately Later after injections are continued over a long period of time circulating antitoxin can be demonstrated in the blood The three stages observed in sequence in rabbits are similar to the three phases occurring in man, an insensitive phase, a phase of skin hypersusceptibility and finally a phase of antitoxic immunity Dochez and Sherman (14) were able to induce a generalized erythema followed by desquamation by infecting sensitized guinea pigs with Streptococcus scarlatinae This rash was probably analogous to that of scarlet fever occurring in man Rabbits usually pass through these three phases during immunization but exceptions occur Occasionally an animal never shows cutaneous allergy and does not develop antitoxin Other rabbits develop antitoxin but never show positive skin reactions We have observed that some adults are negative to the Dick test yet have no circulating antibody These individuals are apparently incapable of sensitization The infantile state of insensitivity to Streptococcus scarlatinae is prolonged throughtheir lifetime This state is presumably analogous to that of rabbits which neither become sensitive nor develop antitoxin The study of the immune reactions in scarlet fever is still too recent to indicate whether or not man may in certain instances develop circulating antitoxin without at sometime showing positive cutaneous reactions to scarlatinal filtrate From our study of sensitization to streptococcus in rabbits, we anticipate that such instances must occur The rule however, is that cutaneous hypersusceptibility occurs at sometime during the development of antitoxic immunity to the scarlatinal tox-allergin This cutaneous sensitivity is probably only incidental but a positive cutaneous reaction in children and adults usually indicates the absence of appreciable quantities of circulating antibody

Allergic cutaneous reactions usually have three distinct characteristics First they occur chiefly in sensitized individuals in whom sensitization has followed natural exposure to a substance or has been induced by repeated small injections of the antigen Second, the reactions commonly disappear after a sensitized individual has been shocked by the intravenous injection of protein or has been desensitized by frequent inoculation with small amounts of the sensitizing substance Third, positive reactions may sometimes be obtained in nonsensitive individuals after the injection of blood or serum from a sensitive person Cutaneous reactions with scarlatinal culture filtrate possess these characteristics Brokman and Mayzner (15, 16) injected ten sensitive infants with filtrate or with killed streptococcus Eight were found to be insensitive within seventy-two hours Three remained negative for eighteen days but five had regained their sensitivity at this time Four infants who were insensitive became sensitive within forty-eight hours after similar injections The authors attribute these fluctuations to sensitization and desensitization They observe that the changes are so abrupt that they cannot be ascribed to antitoxic immunity These experiments satisfy two of the necessary requirements for an allergic reaction Cooke has supplied the third experiment (17)—the passive transfer of a positive cutaneous reaction to a previously insensitive person He observed a positive cutaneous reaction in a previously insensitive infant after transfusion from a sensitive donor

Certain local phenomena occurring following the injection of filtrate into the skin lend support to the allergic hypothesis When an individual develops scarlatina shortly after cutaneous tests have been done with scarlatinal toxic filtrate the rash is at times heightened and at other times may be absent at the site of inoculation Where the test has been done several weeks previous to the scarlatinal infection and the inoculated areas are free from rash, we assume antitoxin has been formed locally in the tissues If the tests are done immediately before the rash appears and the rash is exaggerated or diminished at the site these modifications can only be due to local desensitization or hypersensitization of the tissues These changes in sensitivity are too abrupt to be accounted for by fluctuations in the antitoxin content of the tissues and appear analogous to the general sensitization and desensitization reactions obtained by Brokman and Mayzner One other type of local reaction can be explained most readily by assuming that the rash is allergic When toxic filtrate and antitoxin added together in proper proportion are injected into the skin of a sensitive person, ordinarily no reaction occurs The toxic substance apparently combines with the antitoxin and its action is neutralized Occasionally in extremely sensitive individuals the reaction is only delayed and a severe erythema occurs at the site of innoculation after forty-eight to seventy-two hours Apparently the combination of the substance and antibody is dissociated and the tissues of these extremely sensitive persons gradu

ully absorb the toxic substance even in the presence of antitoxin This situation is somewhat analogous to that observed occasionally during the immunization of horses with diphtheria or tetanus toxins (18, 19) Horses occasionally die during immunization after the injection of quantities of toxin ordinarily insufficient to cause death Antitoxin is often present in the blood serum in large amounts Apparently the tissues of these horses have been so sensitized that they attract the toxin from the circulating antibody We have observed an analogous situation occasionally in scarlet fever where excessive quantities of antitoxin intravenously have had no effect on the rash or acute symptoms Presumably the tissues of the persons with these infections were so hyperallergic that they attracted the toxic substance more strongly than did the antitoxin introduced into the blood stream

One might enquire how nearly eighty per cent of children between the ages of two to four become sensitized to the toxic substance of Streptococcus scarlatinae. To sensitize such a high percentage of children at this early age necessitates a wide distribution of this streptococcus Recent observations have shown that Streptococcus scarlatinae is in fact widely distributed and that strains of streptococcus differing morphologically from Streptococcus hemolyticus may produce the same toxic substance as the hemolytic strains isolated from scarlatinal throats—strains of hemolytic streptococcus recovered from a variety of infections elaborate the toxic scarlatinal substance (20, 21) Usually the toxallergin occurs in filtrate of cultures of these strains in exceedingly small amounts—amounts insufficient to cause a rash in relatively insensitive persons or in individuals with circulating antitoxin Such strains have been recovered from chronically infected tonsils, from infected nasal sinuses, from erysipelas, and from acute tonsillitis In view of the wide distribution of Streptococcus hemolytic in normal throats during the winter months and of the fact that Streptococcus scarlatinæ occurs frequently in acute and chronic infections other than clinical scarlet fever, the sensitization occurring during infancy can be readily comprehended

The experimental evidence and the clinical observations substantiate the allergic hypothesis so convincingly, that we are inclined to accept it as a satisfactory explanation of much of the acute symtomatology scarlet fever and of the Dick reaction The insensitivity of children without antitoxic immunity and the sensitization and desensitization of infants with toxic filtrates cannot be explained otherwise Neither can we explain the negative cutaneous tests in the absence of circulating antitoxin in convalescence from scarlatina except by assuming that the convalescent is desensitized The fact that the sequence of events in man from an insensitive phase in infancy to the acquisition of an antitoxic immunity in adult life can be reduplicated in animals by sensitization and immunization with toxic filtrate is still more convincing How far this hypothesis may be extended to explain the symptoms of other streptococcus infections is as yet undetermined Schick and Escherich and Von Pirquet and Schick who suggested the possibilities of this hypothesis in scarlatina as early as 1912, also suggested that some of the complications—rheumatic fever, arthritis, and nephritis—might also be allergic reactions So far no experimental proof that these complications are allergic in nature has been advanced but we believe that such an hypothesis offers a most satisfactory basis for experimental work on these diseases

THE PRACTICAL MANAGEMENT OF CARDIO-VASCULAR-RENAL BREAKS*

By NORMAN STRAUSS, M D., NEW YORK, N Y

FEW conditions in medicine tax the therapeutic ingenuity of the internist more than does a case of cardio-vascular-renal disease which will not respond to the routine treatment of rest in bed, morphine and digitalis

I employ the term Cardio-Vascular-Renal in an attempt to avoid the confusion of terms presently filling our literature in referring to a case of vascular disease involving primarily the heart and kidneys

I refer to a (any) case whose chief complaints are dyspnea and swelling of the ankles, dizziness, weakness and cough This patient is seen propped up in bed, gasping for air, and is cyanotic His heart is generally irregular, the sounds are distant and of poor muscle quality—murmurs may or may not be heard (depending upon the degree of myocardial damage) There is fluid at both bases, and numerous crackling rales in both lungs The liver is enlarged, tender and occasionally pulsating—the spleen is palpable. There is fluid in the abdominal wall, ascites, pitting edema of the extremities and of the dependent parts

The blood pressure may be low, normal or greatly elevated The urine may be clear, or may contain R B C—W B C and numerous casts of various descriptions The Blood Chemistry may be normal or may show marked evidence of nitrogen retention The eye grounds may be normal, may show venous engorgement or may show marked thinning of the vessels, exudate and evidences of recent and old hemorrhages

I can best present this subject by outlining a plan of procedure that we institute when a case of this nature is admitted to our service at the City Hospital

History

In addition to the routine History taking, we lay special stress on the history of

1 Scarlet Fever—Because of its damaging effect upon the heart and kidneys

2 Diphtheria—Because of the frequency with which it produces myocardial damage

3 Tonsillitis and Acute Rheumatic Fever—Because of the frequent cardiac complications

4 Pneumonia—Particularly of the Influenzal Broncho-Pneumonic type which notably involves the myocardium

5 Metallic Poisonings—Particularly Bichloride of Mercury, for the trade-marks are frequently left on the kidneys

6 Syphilis—Because of the Cardio-Vascular lesions that it produces

7 Heredity

Physical Examination

In addition to the routine physical examination special notes are made on the

1 Heart—Its size, regularity, muscle tone and murmurs

2 Aorta—As manifest by the degree of Retro-Manubrial dullness

3 Blood pressure.

4 Eye ground charges

5 Central Nervous System for Argyll Robertson pupils, knee jerks

The management of these cases I shall outline in chronological sequence·

1 The patient is put to bed and propped up with either pillows or a back rest

2 Morphine is given in liberal doses to diminish the mental anguish as well as the physical strain

3 If the patient be in extremis Digifoline or Digalin is given intramuscularly or intravenously, depending upon the urgency of the case (We have given as high as 5 c c of Digalin intravenously)

4 If the patient is severely decompensated but not in extremis, we use the massive digitalization method One dram of the tincture of Digitalis is given stat—one dram one hour later—one dram two hours later and one dram 3 hours later In other words, 4 drams of the Tincture are given in six hours After that 20 minims of the Tincture are given every 4 hours We are guided by the pulse rate for our subsequent dosage As soon as the rate slows down to 70 per minute we put the patient on a maintenance dose of 20 MM t. i d

5 The fluid intake is restricted to 500 c c in 24 hours

6 The patient is put on a salt free diet (Unless the diet is prepared in a special metabolic kitchen the diet is probably salt poor instead of salt free

7 Mild saline catharsis is also employed to assist in depleting the body fluids

If the patient is going to respond to this regime the signs of improvement should be noted in from 3 to 5 days

The following act as a guide to the progress of the patient

1—The Clinical Course

* From the Medical Service of Dr Harlow Brooks, City Hospital, Department of Public Welfare, New York City

2—The Intake and Output Chart
3—Weight Chart

If the patient fails to respond to the above-outlined treatment within 3 to 5 days, we investigate the possibility of syphilis as a causative or complicating factor The fact that syphilis of the myocardium does occur and that it may act as the primary or contributing cause of Cardiac Decompensation has been established I have discussed this entity in a paper on Circulatory Syphilis published in the *Annals of Clinical Medicine* in 1926 (December)

If syphilis be suspected, either as a result of history, physical examination or serology, a rigid course of Mercury, together with Potassium Iodide is given The Mercury is pushed, in the form of one grain of Mercury Salicylate every other day until the earliest sign of the cumulative effect, namely salivation, presents itself This type of case does remarkably well and when the compensation returns, we put the patient on digitalis together with courses of Mercury at regular intervals

Case—F N, Age 46, Male

Admitted to the Ward

Diagnosis—Of Mitral Stenosis, auricular Fibrillation and Cardiac Decompensation

He gave a definite history of repeated attacks of acute Rheumatic Fever in early childhood For the past year he had been going from pillar to post seeking relief from his present symptoms

Physical examination at the time of admission aside from the cardio-vascular findings, was negative except for a slight irregularity and sluggish reaction of his pupils

He was looked upon as a straightforward case of Rheumatic Heart Disease Digitalization, however, failed to produce the expected effect The patient stated that he had been given digitalis by other physicians with equally poor results We were quite puzzled for a day or two until his Wassermann report came back XXXX He was immediately put on a course of Mercury and K. I together with digitalis with very striking results

If the case does not respond to digitalization and syphilis plays no part, we next turn to our diuretics Numerous diuretics have been employed Those in most common use are 1—The A B C Mixture 2—Caffeine Citrate 3—Diuretin 4—Theopylline. 5—Theocine. In our experience no one given case will respond to any one given diuretic We are, further, unable to classify any group of cases that will respond to any group of diuretics The choice of diuretics depended entirely upon the plan of trial and error We find ourselves in a position directly comparable to the Pediatrician who is confronted with a difficult feeding case

However, our experience with diuretics have enabled us to draw three conclusions

First—If the given diuretic is going to work, it will show its effect within 72 hours

Second—These drugs lose their diuretic effect within 3 to 5 days and it becomes necessary to switch to another The body seems to quickly work up a tolerance to the diuretics, and

Third—When diuresis is once established, the diuretics which proved of no value originally, are frequently helpful

Case—B H F, Age 48, Male

C C Shortness of breath, swelling of legs, and dizziness, for past eight months History of high blood pressure for five years No history of scarlet fever, rheumatism, pneumonia or lues

Physical examination revealed a man with complete cardiac decompensation and general anasarca Fundi were negative except for thinning of the vessels The blood pressure was 220/110 The blood chemistry showed a urea Nitrogen of 23 mgs/100 C C The Wassermann was negative The urine showed occasional R B C and hyaline casts This patient was rapidly digitalized but showed no improvement He was then put on Diuretin with no effect The A B C Mixture likewise proved of no avail The patient grew steadily worse and the edema more marked He was then put on Theocine Gr V t. i d and began to excrete within 12 hours At that time his weight was 144 lbs Within four days the diuresis was so profuse that his weight dropped to 118 lbs, a loss of 26 lbs His general condition began to improve with equal rapidity After 4 days of Theocine he was put back on the Tr of Digitalis and Diuretin (which originally was of no avail) with a resultant complete return of compensation A salt free diet was maintained throughout

If the case fails to respond to the diuretics we turn to Novasurol Our results have been the same as those reported by other clinicians both in this country and abroad It must be definitely emphasized that Novasurol is far from a harmless drug and is absolutely contraindicated in cases with advanced Renal or Liver impairment.

However, in an ideal picked case of general anasarca without evident kidney or liver damage, Novasurol often produces striking results where all other therapy has failed

Our initial dose is 1/2 C C injected deep intramuscularly If the patient shows no ill effects such as salivation or stomatitis, 1 c c is given the following day A diuretic effect is obtained within 6 hours after the initial injection

Case—I K, Age 58, Male

This patient has been known to be a cardiac for eight years to ten I saw him originally in the state of acute cardiac decompensation with a beginning right heart failure as evidenced by marked cyanosis Pulmonary edema and a pulsating liver He was given an ampule of digifoline every 2 hours for four doses, together with liberal doses of morphine He responded very rapidly to the digitalization and his compensation soon returned He was subsequently put on a maintenance dose of the Tincture of Digitalis but he soon decompensated again and it became necessary to put him back on digifoline Numerous attempts were made to find a "mouth preparation" that would keep him compensated but all failed Each time it became necessary to put him on digifoline by mouth and several diuretics

About 6 months ago his compensation broke, and this time not even digifoline produced the desired effect He became progressively worse and was rapidly filling up with water

The Wassermann was negative, the Blood Pressure was 100/65 and urea nitrogen was 24 mgms per hundred C C The fundi showed nothing but venous engorgement—and the urine was negative except for a moderate amount of albumin

In view of the fact that there was no evidence of true Renal pathology 1/2 C C of Novasurol was given intramuscularly Within 8 hours the patient began to excrete The following day 1 c c of Novasurol was given The diuresis was profuse and the conpensation promptly returned From that time up to date (a period of 5 months) he has maintained his compensation on a capsule containing one grain of Squill and one grain of the Powdered Digitalis leaf, taken three times a day for two weeks on and two weeks off

It must be admitted, however, that many cases of Cardio-Vascular Renal disease resist all known therapy and gradually make their exodus by either "drowning" themselves in their own body fluids or "suffocating" themselves with nitrogen retention

CONCLUSION

1—If a case of C V R. disease is going to respond to Digitalis it will begin to show signs of improvement in 3 to 5 days

2—If a case fails to respond to Digitalis, Syphilis should be investigated as a primary or contributing cause Anti-Leutic treatment should be given together with Digitalis

3—The diuretics are selected on a plan of trial and error

4—If a diuretic is going to act, it will produce diuresis within 72 hours

5—Any one diuretic loses its effect in 3 to 5 days

6—In a case of general anasarca, without evident Renal or Liver impairment, Novasurol acts as a drastic diuretic.

A CASE BELONGING TO THE WILSON'S DISEASE—PSEUDOSCLEROSIS GROUP*

By G M MACKENZIE, M D, and WILDER PENFIELD, M D, MONTREAL, CANADA

A GIRL of thirteen years, ill for two and one-half years with the following symptoms drooling, difficulty in walking, occasional headaches, stiffness of legs, stiffness of arms, dysarthria, dysphagia, contractures The onset was preceded by an attack of jaundice No tremor, no convulsions

The disease progressed steadily until her death, two and one-half years after the onset

The general physical examination showed emaciation, decrease in size of the liver, narrow rim of greenish brown pigmentation at the outer border of the iris, spleen not enlarged There were no symptims of cirrhosis of the liver

The neurological examination showed extreme contractures of the extremities, hypertonicity of the entire somatic musculature with a fixed laugh Mobile spasms lasting a second or two, no genuine paralysis, but loss of voluntary control and muscular activity because of rigidity and contractures Deep reflexes and abdominal reflexes present No sensory disturbances except possibly hyperalgesia Magnus and deKlijn reflexes absent No decerebrate rigidity, no constant tremor, spinal fluid negative, Wassermann on blood and spinal fluid negative

Autopsy showed advanced portal cirrhosis of the liver, enlarged spleen, numerous small degenerative lesions 3mm -3cm *in diameter, dis*tributed for the most part in the white matter just beneath the cortical grey These areas of softening were scattered throughout the brain The lenticular nucleus showed no gross changes Pathological findings in central nervous system will be reported in detail later

* Abstract of paper read at the Annual Meeting of the Medical Society of the State of New York at Albany, N Y, May 22, 1928. Complete article will be published in 'Brain' at a later date.

ANTICIPATING 1929

The opening of the year 1929 finds the Medical Society of the State of New York prepared to act more efficiently than ever before The 1928 record of the activities of the State Society is one of achievement in distinction from theory, as anyone may discover on consulting the news department of this JOURNAL. That New York is not alone in achievement is shown by the index to the department "Our Neighbors," which quotes the activities of other state societies as recorded in their Journals Further progress may be anticipated in 1929 toward the assumption of leadership by physicians in all forms of medical service

Case—I K, Age 58, Male

This patient has been known to be a cardiac for eight years to ten I saw him originally in the state of acute cardiac decompensation with a beginning right heart failure as evidenced by marked cyanosis Pulmonary edema and a pulsating liver He was given an ampule of digifoline every 2 hours for four doses, together with liberal doses of morphine He responded very rapidly to the digitalization and his compensation soon returned He was subsequently put on a maintenance dose of the Tincture of Digitalis but he soon decompensated again and it became necessary to put him back on digifoline Numerous attempts were made to find a "mouth preparation" that would keep him compensated but all failed Each time it became necessary to put him on digifoline by mouth and several diuretics

About 6 months ago his compensation broke, and this time not even digifoline produced the desired effect. He became progressively worse and was rapidly filling up with water

The Wassermann was negative, the Blood Pressure was 100/65 and urea nitrogen was 24 mgms per hundred C C The fundi showed nothing but venous engorgement—and the urine was negative except for a moderate amount of albumin

In view of the fact that there was no evidence of true Renal pathology 1/2 C C of Novasurol was given intramuscularly Within 8 hours the patient began to excrete The following day 1 c c of Novasurol was given The diuresis was profuse and the conpensation promptly returned From that time up to date (a period of 5 months) he has maintained his compensation on a capsule containing one grain of Squill and one grain of the Powdered Digitalis leaf, taken three times a day for two weeks on and two weeks off

It must be admitted, however, that many cases of Cardio-Vascular Renal disease resist all known therapy and gradually make their exodus by either "drowning" themselves in their own body fluids or "suffocating" themselves with nitrogen retention

Conclusion

1—If a case of C V R. disease is going to respond to Digitalis it will begin to show signs of improvement in 3 to 5 days

2—If a case fails to respond to Digitalis, Syphilis should be investigated as a primary or contributing cause Anti-Leutic treatment should be given together with Digitalis

3—The diuretics are selected on a plan of trial and error

4—If a diuretic is going to act, it will produce diuresis within 72 hours

5—Any one diuretic loses its effect in 3 to 5 days

6—In a case of general anasarca, without evident Renal or Liver impairment, Novasurol acts as a drastic diuretic.

A CASE BELONGING TO THE WILSON'S DISEASE—PSEUDOSCLEROSIS GROUP*

By G M MACKENZIE, M.D., and WILDER PENFIELD, M D, MONTREAL, CANADA

A GIRL of thirteen years, ill for two and one-half years with the following symptoms drooling, difficulty in walking, occasional headaches, stiffness of legs, stiffness of arms, dysarthria, dysphagia, contractures The onset was preceded by an attack of jaundice. No tremor, no convulsions

The disease progressed steadily until her death, two and one-half years after the onset.

The general physical examination showed emaciation, decrease in size of the liver, narrow rim of greenish brown pigmentation at the outer border of the iris, spleen not enlarged There were no symptims of cirrhosis of the liver

The neurological examination showed extreme contractures of the extremities, hypertonicity of the entire somatic musculature with a fixed laugh Mobile spasms lasting a second or two, no genuine paralysis, but loss of voluntary control and muscular activity because of rigidity and contractures Deep reflexes and abdominal reflexes present No sensory disturbances except possibly hyperalgesia Magnus and deKlijn reflexes absent. No decerebrate rigidity, no constant tremor, spinal fluid negative, Wassermann on blood and spinal fluid negative.

Autopsy showed advanced portal cirrhosis of the liver, enlarged spleen, numerous small degenerative lesions 3mm -3cm in diameter, distributed for the most part in the white matter just beneath the cortical grey These areas of softening were scattered throughout the brain. The lenticular nucleus showed no gross changes Pathological findings in central nervous system will be reported in detail later

* Abstract of paper read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y, May 22, 1928. Complete article will be published in 'Brain" at a later date.

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5056

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

ANTICIPATING 1929

The opening of the year 1929 finds the Medical Society of the State of New York prepared to act more efficiently than ever before The 1928 record of the activities of the State Society is one of achievement in distinction from theory, as anyone may discover on consulting the news department of this JOURNAL. That New York is not alone in achievement is shown by the index to the department "Our Neighbors," which quotes the activities of other state societies as recorded in their Journals Further progress may be anticipated in 1929 toward the assumption of leadership by physicians in all forms of medical service

THE PRACTICE OF MEDICINE BY MEDICAL SOCIETIES

It is a popular idea that the practice of medicine consists only in the private practice of individual doctors as they treat individual sick people This was formerly the entire scope of medical practice, and is still the ideal toward which medicine is tending When each person makes provision for medical service for himself and his family, there will be small need for public health work by official departments of health and lay organizations Dr George Vincent expressed this idea in his address in 1925 before the Medical Society of the State of New York, in which he stressed the idea of every doctor a health officer, and cited the realization of this idea by the physicians of Denmark But the fact remains that the laws of health are as complicated as those of sociology, and no one can anticipate every possible condition affecting health or guard against all forms of health hazards while maintaining his position as a producing member of society Neither the patient nor the physician acting individually can control all the conditions which influence health and sickness, but there must be group action on the part of both the doctor and the patient

The community has a responsibility for the health of its individual citizens, and the physician cannot fulfill a reasonable amount of his obligation to the people unless he acts in harmony with his fellow doctors

There is an immense field for the practice of public health in distinction from that of private practice, but the field has been developed within a generation, and its practice is still largely altruistic. Doctors hesitate to enter upon it, because it does not pay financially, public officials hesitate to promote it because they often look upon it as a fad, and people are slow to take it up because they do not know what it is all about, and cannot see that they receive immediate benefit from it, yet the practice of public health and civic medicine is fast becoming the recognized duty and responsibility of both the medical profession and the public

The lay organizations have anticipated the doctors in recognizing the advantages and desirability of the practice of public health, and societies of public spirited citizens have entered those fields with the apathetic consent of the doctors However, physicians have come to realize that if they are to maintain their position as the source of medical knowledge and practice, they must enter upon the practice of civic medicine They cannot remain outside the field and still criticize those who are toiling there They must enter the field and direct the workers and do their own share of the work

The question which confronted the medical prophets a few years ago was how could physicians engage in the practice of public health and civic medicine The answer was that it should be done by means of the County Medical Societies, for a group of doctors could do what the individual physicians could not accomplish Yet medical society practice is done by individual leaders, but with this difference,—the leaders personify the impersonal group called the medical society, as they speak and act in its name

The activities of a county medical society constitute the practice of medicine as truly as the diagnosis of the ills of individuals, and the performance of surgical operations A doctor practices medicine when he arranges a program for a county society, or delivers a public health lecture before a woman's club, or asks a Board of Supervisors to establish a county health department, but the credit goes to the county society which he represents

While group action by physicians is necessary in the modern practice of medicine, it is equally true that group action by the people is also necessary Individual action is aroused by the group An individual hesitates to give money or time to any health project unless it is promoted by a group which will insure the permanence and stability of the work The response of the people to activities of lay health organizations is evidence of the essential importance of the cooperation of the people in any medical work The great accomplishment of the lay health organizations is that of rousing the people to demand the benefits of the practice of public health and civic medicine There must be a willingness on the part of the people to accept medical advice before physicians can practice any form of medicine The people insistently demand relief when they are in pain A responsibility rests on the medical profession to instruct the people regarding the aims and projects of the doctors Giving medical instruction to the people is a function of the county medical society, and the society practices medicine when it fulfills that function

Every physician is under an obligation to support his county medical society as it practices medicine It is not expected that every physician will be able to devote considerable time to county society work, but he can at least support his society just as he supports his lodge and his church He can uphold the hands of the leaders and can take the parts to which he may be assigned when his turn or opportunity comes The Medical Society of the State of New York has developed a consistent plan for the county societies to follow, and its Committee on Public Relations is ready to advise every county society how it may practice public health and civic medicine

INDEXING MEDICAL SOCIETY ACTIVITIES

The State Medical Journals record the activities of the medical societies of the states and their constituent county societies The years roll by rapidly, and when one looks up the story of an activity, he is likely to be surprised to find it recorded two or three years farther back than he had supposed. A State Journal is not ephemeral It is a permanent record, and officers owe it to their successors to record their plans and aspirations as well as their achievements, in order that future officers may have the benefit of the previous debates and experiences If, for example, the physicians of New York State and the promoters of lay health organizations had read the story of the attempts of the Medical Society of the State of New York to establish county departments of health between 1885 and 1889, as recorded in the transactions of the Society, and in this JOURNAL of October 1, 1928, page 1180, there would not have been so much propaganda and publicity of alleged ultra-modern developments which turn out to be the old plans devised by medical prophets years ago Medical history is conducive to humility and respect for the devoted leaders of a half century ago

The last issue of this JOURNAL,—that of December 15, 1928,—contains the annual index to which was added a five-page special index of the activities of the State Society and its component county societies This index was made in accordance with plans set forth in a paper on "Indexing and Abstracting News Items of Medical Societies," presented before the American Library Association and printed in this JOURNAL of October 1, 1928, page 1165 This same subject was also presented before the Tri-State Conference at Atlantic City, on November 10, and before the annual conference of State Secretaries and Editors conducted by the American Medical Association, in Chicago on November 17, both of which were reported in the December first JOURNAL

The Publication Committee of the Medical Society of the State of New York will send a reprint of the index to the State Journals and to the Medical Librarians, as an illustration of what an index of medical society activities may be. The Council of the Medical Society of the State of New York has voted that a similar special index be prepared and published quarterly for the benefit of the officers of the medical societies The editors have therefore planned to publish such an index in the last issue of March, June, September and December of this year

The particular occasion for the publication of the index was that the officers frequently called for the record of plans, resolutions and accomplishments of medical societies throughout the state During the past year medical societies have considered their civic duties to an extent far exceeding that of previous years, and this is only a beginning of what the same societies may be expected to undertake in the future

Moreover, the record of the practice of civic medicine made by medical societies is contained in the state journals to a far greater extent than anywhere else Public health journals and the organizations of voluntary health societies generally ignore the civic activities of physicians, but the state journals are the natural repositories of information regarding the activities of medical societies A special index of those activities will not only render the records available, but it will also stimulate the officers to report their activities fully and completely

---

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Duty of the County Medical Society to the Public The Medical Society of the State of New York some forty-five years ago, proposed that physicians should assume the leadership in public health and should establish a county department of health in every county in place of the boards of health of towns and villages (See this Journal October 1, 1928, page 1180) The leadership of doctors in public health and civic medicine was also advocated by the Iowa Medical Journal and reprinted in the New York State Journal of Medicine of January, 1904, from which the following extract is taken

"The local medical society ought to know all about the doings of its board of health, about its community water supply, the sewerage system, the sanitation of its school houses It ought to lend its influence toward making clean, beautiful streets, regulating various nuisances, smoke, unnecessary noises, etc The local society ought to have something actively to say and do about the grossly immoral advertising and the nauseating patent medicine notices that appear in the local papers"

County medical societies are now approaching the realization of these ideals

THE PRACTICE OF MEDICINE BY MEDICAL SOCIETIES

It is a popular idea that the practice of medicine consists only in the private practice of individual doctors as they treat individual sick people This was formerly the entire scope of medical practice, and is still the ideal toward which medicine is tending When each person *makes provision for medical service for himself* and his family, there will be small need for public health work by official departments of health and lay organizations Dr George Vincent expressed this idea in his address in 1925 before the Medical Society of the State of New York, in which he stressed the idea of every doctor a health officer, and cited the realization of this idea by the physicians of Denmark But the fact remains that the laws of health are as complicated as those of sociology, and no one can anticipate every possible condition affecting health or guard against all forms of health hazards while maintaining his position as a producing member of society Neither the patient nor the physician acting individually can control all the conditions which influence health and sickness, but there must be group action on the part of both the doctor and the patient

The community has a responsibility for the health of its individual citizens, and the physician cannot fulfill a reasonable amount of his obligation to the people unless he acts in harmony with his fellow doctors

There is an immense field for the practice of public health in distinction from that of private practice, but the field has been developed within a generation, and its practice is still largely altruistic. Doctors hesitate to enter upon it, because it does not pay financially, public officials hesitate to promote it because they often look upon it as a fad, and people are slow to take it up because they do not know what it is all about, and cannot see that they receive immediate benefit from it, yet the practice of public health and civic medicine is fast becoming the recognized duty and responsibility of both the medical profession and the public

The lay organizations have anticipated the doctors in recognizing the advantages and desirability of the practice of public health, and societies of public spirited citizens have entered those fields with the apathetic consent of the doctors However, physicians have come to realize that if they are to maintain their position as the source of medical knowledge and practice, they must enter upon the practice of civic medicine They cannot remain outside the field and still criticize those who are toiling there They must enter the field and direct the workers and do their own share of the work

The question which confronted the medical prophets a few years ago was how could physicians engage in the practice of public health and civic medicine The answer was that it should be done by means of the County Medical Societies, for a group of doctors could do what the individual physicians could not accomplish Yet medical society practice is done by individual leaders, but with this difference,—the leaders personify the impersonal group called the medical society, as they speak and act in its name

The activities of a county medical society constitute the practice of medicine as truly as the diagnosis of the ills of individuals, and the performance of surgical operations A doctor practices medicine when he arranges a program for a county society, or delivers a public health lecture before a woman's club, or asks a Board of Supervisors to establish a county health department, but the credit goes to the county society which he represents

While group action by physicians is necessary in the modern practice of medicine, it is equally true that group action by the people is also necessary Individual action is aroused by the group An individual hesitates to give money or time to any health project unless it is promoted by a group which will insure the permanence and stability of the work The response of the people to activities of lay health organizations is evidence of the essential importance of the cooperation of the people in any medical work The great accomplishment of the lay health organizations is that of rousing the people to demand the benefits of the practice of public health and civic medicine There must be a willingness on the part of the people to accept medical advice before physicians can practice any form of medicine The people insistently demand relief when they are in pain A responsibility rests on the medical profession to instruct the people regarding the aims and projects of the doctors Giving medical instruction to the people is a function of the county medical society, and the society practices medicine when it fulfills that function

Every physician is under an obligation to support his county medical society as it practices medicine It is not expected that every physician will be able to devote considerable time to county society work, but he can at least support his society just as he supports his lodge and his church He can uphold the hands of the leaders and can take the parts to which he may be assigned when his turn or opportunity comes The Medical Society of the State of New York has developed a consistent plan for the county societies to follow, and its Committee on Public Relations is ready to advise every county society how it may practice public health and civic medicine

phenomenon Psychic factors may play a role in ordinary icterus and even gallstone disease may be influenced unfavorably —*Klinische Wochenschrift,* November 11, 1928

The Value of Periodic Health Examinations A Grant Fleming, writing in the *Canadian Medical Association Journal,* November, 1928, xix, 5, emphasizes the fact that while community health work does a great deal to protect citizens from communicable diseases it has its limitations and makes very little contribution towards the positive ideal of health Individual health depends essentially upon the individual's practice of what is called "personal hygiene" There is no lack of general health advice, but many of those who read it or hear it fail to see or understand the personal implication or the need of personal application We need to have this pointed out to us, we need to be periodically checked up on it, and that is exactly what the family physician will do in the periodic health examination The discovery of defects or early disease, important as this is, is the lesser value of periodic health examinations Although a large percentage of apparently well individuals will be found with physical defects that require treatment, with early symptoms of disease whose cure or arrest depends upon prompt action, it is the need for advice concerning the maintenance of health that is the more important point There are very few who do not need personal advice in the matter of diet, exercise, rest and relaxation, elimination, and other phases of personal hygiene. This type of advice needs behind it the same type of scientific knowledge and thought as does the prescribing of remedies for the acutely ill The family physician, because of his knowledge of economic, social, and home conditions, and because confidence is reposed in him, is the best qualified for this service. All should avail themselves of this opportunity to safeguard their lives and to attain greater efficiency, by securing for themselves a periodic health examination

Malta Fever Cured by Intravenous Injection of Trypaflavin.—H Darre and A Laffaile report a case of undulant (Malta) fever treated at the Pasteur Institute in Paris with a strikingly favorable outcome The patient was a youth who had apparently been infected through goat's milk He had had his disease 6 weeks before admission to the hospital and after a month's treatment had not improved A first injection of trypaflavin given at this period showed no action on the fever curve, but a larger dose, one two days later gave a positive result, the temperature became subnormal the following day and thereafter stood constantly at normal with general improvement As the spleen was enlarged a third injection was given which caused a reduction in size of the organ After more than two weeks of quiescence a new febrile period set in but quickly yielded to further injections Now after several months the patient has had no further relapse and is enjoying his former good health The case seems an undoubted one of successful chemotherapy and the authors advocate the general employment of trypaflavin intravenously The first dose should not exceed 0 1 cc to feel out the patient's susceptibility If this is satisfactory the next dose, given two days later, is doubled and the third with a delay of three days is 0 3 cc A fourth dose with a four day interval should be given, going as high as 0 4 cc Study of the authors' case shows that this was the plan followed even with the patient making a good response to the treatment Thus when the maximum dose of 0 4 cc was given the patient was free from all symptoms and was putting on flesh The idea of the large dose during the latent period is then purely to prevent or abort or minimize a relapse —*Bulletin de l'Academie de Medecine,* Oct 16, 1928

Psychotherapy of Graves' Disease —E Moos speaks of the occasional psychogenic origin of this affection and quotes Nonne's 10 cases in a series of 39 He was therefore moved to test psychoanalysis in the treatment of the malady The only case reported has been under treatment about two years and is now entirely recovered, and judging from the photographs the patient must be in excellent condition Before the hyperthyroid syndrome had fully declared itself she was placed on the insulin treatment for loss of weight, but without result Her general condition became so bad that operation was contraindicated and even irradiation was thought unsuitable Apparently tuberculous infection of the right apex was complicating the hyperthyroidism Psychoanalysis brought out the fact of an amour with a young man a year before admission The menstrual suppression due to the disease was ascribed by her to pregnancy and she developed a mental conflict with depression and excitement. The author removed the impression that she was pregnant and when she had become enlightened as to her true condition she began to improve and the entire picture of hyperthyroidism left her She gained 28 pounds in weight. The mental cause of some of these cases was very obvious, as breaking an engagement, infidelity, etc A prolonged psychoanalytic treatment would not be worth while, the writer says, in any but severe cases of Graves' disease —*Deutsche medizinische Wochenschrift,* Oct 26 ,1928

Action of Radiation on the Blood-Supply of Tumors —In previous papers J C Mottram has presented experimental evidence to show that the action of radiation on blood vessels and on the blood supply is very important, and that it will explain many experimental and clinical findings besides giving a useful working hypothesis for

MEDICAL PROGRESS

Rider's Leg—Dean F Winn calls attention to a condition which is met fairly frequently in military service and quotes statistics showing that it is of more than passing economic importance Rider's leg is a strain of the adductor muscles of the thigh There is always a history of sudden forceful gripping of the saddle in an effort to avoid being unseated There is partial loss of function and pain which inhibit proper suppleness and render riding uncomfortable and unsafe There is acute tenderness on firm palpation over the upper tendon of the adductor longus, most marked at its bony attachment, this symptom persists long after other complaints have subsided There may be slight swelling over the belly of this muscle Ecchymosis sometimes occurs in the pubic region and may extend along the inner surface of the thigh as far down as the knee In many of the mild cases recovery takes place in from a few days to two weeks, but healing may require months, especially in recurrent cases In the early stages rest and local heat are useful Riding should be interdicted while the acute symptoms persist, walking may be allowed In order to give a degree of support to the adductors strapping with adhesive tape has given gratifying results The adhesive is applied in alternately oblique strips, beginning well up in the crotch, covering the upper half of the thigh and reaching well around the anterior and posterior surfaces In cases requiring prolonged support an elastic thigh stocking has been used with success This is made from the ordinary woven elastic stocking fabric and is formed to fit quite snugly the upper two-thirds of the thigh The outer section of the stocking extends up as high as the trochanter, and carries a vertical strip of whalebone to prevent wrinkling The upper margin is slightly rounded by padding covered with chamois to obviate pressure Two vertical strips of webbing pass upward over the iliac crest where they are buckled to an elastic suspender, passed over the opposite shoulder—*The Military Surgeon,* October, 1928, lxiii, 4

Cancer of the Tongue With Skin Metastases—Prof Du Bois of Geneva relates what is probably a unique case of cancer of the tongue We know that cancer in this locality is distinguished for its regional lymphnode metastases and that on rare occasions the lymphnodes within the thorax may be involved, but of other metastates we know little or nothing The patient was a man of 49 with a leucoplakia patch on the tongue He was placed on a strict regimen of mouth hygiene and watched closely, 14 years passing before there was transition into cancer or rather the suspicion of it The lesion was then excised and the operation served at the same time for biopsy Prof Askanasy found an ordinary pavement epithelioma with epidermic pearls Radium was used in the excision wound There had been no reaction in the regional lymphnodes The radium needle sutured into the wound, however, produced a violent reaction with great swelling of the tongue and necrosis in situ, but finally the organ showed complete resolution Ten months after intervention multiple tumors appeared on the face, called by the author nodular carcinosis The growths resembled the skin metastases sometimes seen in mammary cancer There was no tendency to ulceration Some of the growths underwent spontaneous involution, but others appeared and the patient became cachectic Under the microscope all of the growths were seen to be pavement-cell epithelioma like the primary growth The author admits the difficulty of proving metastasis and the mode of diffusion and also admits that the growths may have been independent of cancer of the tongue—*Schweizerische medizinische Wochenschrift,* Oct 27, 1928

Psychic Icterus and the Influence of Affects on the Bile Flow—E Witkower writes briefly on this subject beginning with the universal popular belief that anger can cause jaundice He has instituted a research to determine the truth or error of this belief Langheinrich claimed that the biliary secretion could be modified in the hypnotic state, although an effective element was not shown to be present. Mention of certain food articles is the only mental influence stated The author obtained bile by duodenal sounding after the test subjects had been subjected to the action of the basic emotions of joy, grief, fear, and anger These affective states were obtained only through suggestion in the hypnotic state All patients tested showed uniformely that the first three of the affective states promptly caused a flow of bile, the effect of anger being, however, quite the opposite This test had to do only with quantitative change Qualitative alterations also occur as indicated by color changes, but the author does not take them up in this brief article Why does anger arrest the secretion of bile? Evidently, he says, secretion is arrested or there is an arresting spasm of the bile passages Evidence thus far shows that the latter is more probable as a causal factor, although the other cannot be eliminated Atropine injection does not interfere with the phenomenon Certain subjective sensations which accompany anger retention suggested a state of spasm somewhere in the bile passages Acute indigestion from vexation is probably a parallel

flooded with colonic contents A number of copious enemata had been given because it was thought the bowels should be moved Murphy says the newly closed abdominal wound presents a problem in physics, and describes experiments which he had carried out demonstrating that the forces drawing the wound apart are not concentrated on the edges of the incision, but extend all around the surface of a cylinder The indication, therefore, is support all around, so that there is no unprotected spot in the whole abdominal wall The best way to imitate nature's plan is to apply an additional panes in the form of a heavy abdominal binder It should be pinned on tightly and held below by wide strips of adhesive plaster extending over the outer surface of the thighs, and above by adhesive plaster extending along the sternum It is essential that the binder have a grip on the thorax and on the pelvis The mechanism of the binder is thus borrowed from the anatomical arrangement of the abdominal muscles and fascia A properly adjusted binder does not embarrass respiration, but lends a degree of comfort such as obtains in a wounded limb after it is dressed and immobilized The third case illustrates the mistake of heroic efforts to move the bowels under such circumstances If there is no response to a moderate sized enema, it should be siphoned back, the patient being given 1/4 grain of morphine, and allowed to sleep Often the bowels move after a few hours of rest without further enemata Too much emphasis has been placed on the paralyzing effects of morphine on the bowel The precious rest it induces in such a case restores the whole physiological stance, and knits up the ravelled threads of nerve exhaustion, so that the bowel comes back from a negative to a positive poise—*Canadian Medical Association Journal,* November, 1928, xix, 5

The Possibility of Increasing Resistance to Disease.—R Heilig and H Hoff have tried to control centrally the formation of antibodies On the supposition that the central nervous system plays a rôle here there is the possibility that injury to the same could weaken the defence In subjects with tumor of the cortex there was no deviation from the normal values of the opsonins and agglutinins, although in one exceptional case both of these indexes were notably lowered, the lesion being a large glioma which compressed numerous important structures at the base of the brain The authors cherished a belief that injury in the vicinity of the strio-pallidum might in some way be concerned with immunity activities, and since lesions in this part of the brain are seen after encephalitis lethargica they studied some of these subjects, but the results as to opsonins and agglutinins were negative Comparing a variety of data the authors believe that the cerebral cortex and the cerebellum can have no connection with an immunity "center" but on the other hand the basal portion of the encephalon does stand in some kind of relationship with the formation of defensive substances, or at least when there is injury here production of the latter is lowered We also know that in depressive functional states—that is, where an emotional origin is evident—the formation of defensive antibodies is interfered with The same effect is seen in connection with addiction to drugs such as morphine and veronal The authors formulate no conclusions for the clinic which is probably just as well, for many with cerebral lesions, affective melancholia, and drug addiction seem particularly invulnerable to ordinary exogenous disease causes—*Klinische Wochenschrift,* October 21, 1928

Modern Morphology Its Importance in the Study of Disease—Philip Rice believes that by substituting the word morphology for constitution it is possible to gain a clearer conception of the basic condition with which the physician is called upon to deal Neurologically, metabolically, and psychologically the organism is a unit. The endocrine system, with its vegetative nervous connections, is the link between the metabolic processes and the higher neural and psychic processes and is intrinsically concerned with the emotional reactions associated with adjustment to environmental situations As Di Giovanni expresses it, "All that which in the individual indicates a morphological discord, or an anomaly in the process of development (ontogeny), is the source, or may be the source, of morbidity" He states that in every epoch of life the cause of special morbidity resides in the special morphology of the organism With this conception the mission of the physician becomes elevated and extended Applying these principles to preventive medicine, experience shows that in certain individuals pulmonary phthisis, certain cardiac diseases, etc, can be avoided when the individual morphologies are understood and intelligently dealt with When founded on the science of morphology preventive medicine becomes something other than empiricism Applying the morphological principle to the study of pharmacology it will be seen that for the study of drug actions and the scientific administration of drugs for the cure of disease, we require laws which are founded on the natural laws of the *human* organism Experiments carried out on the lower animals to determine the physiological action of drugs are by no means devoid of value, yet it is not difficult to see that the more the experimental animals depart from the human type, the greater must be our reserve when we come to apply the drugs thus tested to the treatment of disease A knowledge of the natural laws of the human organism and the scientific methods of treatment founded on these laws can be derived only from a thorough knowledge of the general and special morphology of man—*Medical Journal and Record,* November 7, 1928, cxxviii, 9.

therapy He now describes experiments which deal with the difference between the suspectibility of rapidly growing and of slowly growing tumors Clinically, fast-growing tumors appear to be more susceptbile than slow ones In vitro experiments show that there is no decided difference in susceptibility between tumor cells from rapidly and slowly growing tumors, though the latter are a little more susceptible than the former Experiments in vivo, in contrast to the previous results, show a large difference in susceptibility, the fast-growing tumors are far more easily destroyed The suggestion is that this extra destructive action in the case of fast-growing tumors is due to interference with the blood supply, on which radiation is known to have a deleterious action Mottram finds that in fast-growing tumors the cells are abundantly and closely packed around the blood vessels He has shown that the nuclei of cells swell to about three times their normal size (superficial area) on about the second or third day after irradiation This increase in bulk must take place at the expense of and bring pressure to bear upon surrounding tissues and structures Thus capillaries and veins will be pressed upon, and in fast-growing tumors where the intravascular spaces are closely packed with tumor cells this will take place to a greater extent than where the tumor cells are less closely packed, as in slow-growing tumors Therefore, the rate of growth is not primarily the determining factor, it is because closely packed cells are commonly found in fast-growing tumors that these are especially susceptible to irradiation —*The Lancet,* November 10, 1928, ccxv, 5489

Vaccinal Encephalitis.—H Deicher states in connection with post-vaccinal encephalitis that all efforts to transfer it to animals have been unsuccessful save those claimed by Gorter and van Nederveen who believe that it is directly transmissable The support for their belief is not stated During the past 15 years 10,000,000 vaccinations have been performed in Prussia alone and but three cases of post-vaccinal encephalitis have been recorded among that number Hence it would be unwise and premature to attempt any sort of generalisation whatever from these few cases The Prussian Minister for Public Welfare has asked that all diseases developing after vaccination be promptly reported and further that should a case of encephalitis follow, vaccination should be suspended for that particular locality for several months In the whole of Germany during 1927 there were but 4 cases of smallpox reported and every one of these patients had contracted his disease outside of the country The recent tightening of the vaccination laws in Italy and Roumania has led to a notable reduction of smallpox incidence and mortality The introduction of the right of conscientious objection into Switzerland was followed by notification of more than 14,000 cases of smallpox in 1927 All of these figures above given should be weighed against the risk of encephalitis Fear of the latter will stimulate conscientious objection, and the latter if recognized officially will be succeeded by a marked increase of smallpox morbidity and mortality The writer hopes that the success of compulsory vaccination in Germany will be a sufficient argument against any further experimentation —*Deutsche medizinische Wochenschrift,* November 9, 1928

Syphilis and Frambesia.—F Jahnel and J Lange have been studying the subject of the relationship of these two diseases, in part along experimental lines In 1925 they began experiments in inoculating paretic subjects with frambesia virus Two strains from Central America were used with negative results, and the subjects being shown to be immune Then other strains from the Far East were substituted In various animal experiments different frambesia strains, they say, exhibit different properties The first inoculation made on a paretic was followed by a positive take but there was a marked resistance to the virus, and there is no mention of any but slight local manifestations which, however, showed the frambesia spirochete There is considerable doubt as to the validity of this test and to offset it there were many negative results with several different strains of frambesia virus, including the one which gave the isolated positive result If we regard the weight of the evidence as decidedly negative this does not mean, in the author's estimation, that the two diseases are one, but that subjects with paresis and lues cerebri show a marked resistance to the *Treponema pertenue* and also that the two diseases have a very close kinship One might even speak of frambesia-syphilis as a unit disease of composite character The frambesia member of the group is not known to be followed by the quarternary manifestations of syphilis and there is no metaframbesia to compare with metasyphilis Many observers have been struck with the small incidence of syphilis in localities where frambesia is very prevalent, this including the absence of metasyphillis —*Klinische Wochenschrift,* November 4, 1928

The Post-Operative Accident.—George H Murphy cites in illustration of the points he wishes to emphasize three cases of post-operative accident In two cases coughing on the ninth and twelfth day, respectively, resulted in complete opening of the abdominal wound and disembowelment In the third case, following appendectomy peritonitis developed on the fourth day and, when the abdomen was opened to insert a tube for the relief of distention, the appendix stump was found to have opened and the abdominal cavity was

were isolated After this "fastings and prayers" were had, and then in accordance with the principle that "God helps those who help themselves," a great diminution of diphtheria, typhoid, erysipelas, scarlet fever, measles and other diseases was discovered [5]

Between the years 1849 and 1854, cholera was raging in the cities of the United States Days of fasting and prayer were held, but little else was done, and the plague continued with its ravages [6] During the latter years of this period, New York City lay within the deadly grip of typhus Young Dr Stephen Smith, who had just completed the two years of his interneship at Bellevue Hospital, was put in charge of the tents on Blackwell's Island by the Commissioners of Charities He soon observed that there was a continual inflow of patients from a single building in East 22nd Street Dr Smith visited this tenement, and found it full of fever cases The cellar was partly filled with filthy sewage, the floors were littered with decomposing straw, which the occupants used for bedding, every available place, from cellar to garret, was crowded with immigrants—men, women and children The whole establishment was reeking with filth, and the atmosphere was heavy with the sickening odor of the deadly typhus, which reigned supreme in every room [7] Public records were then inadequately kept, and after an almost incredible search the agent of the man who owned this pestilentious place was found A request to him that the house should be vacated at once and put in decent order, was refused "with a contemptuous remark as to the absurdity of furnishing such vagrants and immigrants better quarters in which to live" [8]

There was then no Health Department, but Dr Smith called at the headquarters of the metropolitan police Through the legal adviser of that department, the owner of the premises was at last found He lived in an aristocratic neighborhood, and was a member of one of the most popular churches of the day The unspeakable condition of his tenement house was called to his attention, but he expressed indignation at any interference with the management of his property, declaring that as the house yielded him no income, he would not expend a dollar for the miserable creatures who lived there in disease and filth [9] Research into the law revealed that there was then neither ordinance nor statute under which action could be taken In despair at this point, Dr Smith called upon Mr William Cullen Bryant, the editor of the *Evening Post*, who readily expressed a willingness to expose the case and suggested that in any event, the police should arrest the owner This was done At the threshold of the court a reporter interviewed him Presently, he was in terror and begged that no further action should be taken, promising the court that he would make the necessary improvements This was done [10]

A consequence of Dr Smith's aggressive action was not only the sanitation of that particular tenement house, but an awakening on the part of the entire community to the fact that there were no laws under which such a glaring violation of the simplest principles of health and common decency could be corrected [11]

It seems at this time there had already been a growing sentiment in favor of reform and of establishing proper health regulations The writings of Dr John H Griscom, Dr Joseph M Smith, Dr Elisha Harris and others, had been stimulating it The Academy of Medicine passed resolutions favoring proper health laws, but nothing effective had been accomplished Presently, however, the "Sanitary Association" was formed, and annually for several years introduced health bills into the legislature, but through the opposition of the "City Inspector," who would lose his position if the new laws were passed, these remedial measures were defeated

Finally, in the early sixties, Peter Cooper organized the famous "Citizens Association," and enlisted in its ranks a hundred of New York's most prominent citizens This association set to work upon the problem One of the objects of this body was the reform of all branches of the municipal government It was in the days when Boss Tweed was at the height of power, and as the proposed reforms would interfere with the political positions of many of his henchmen, the efforts of Peter Cooper and his associates for several years encountered failure [12] Finally, at the instance of this "Citizens Association," a thorough sanitary inspection of the city was made by a corps of competent physicians Its full and accurate report was regarded here, and in Europe also, as a creditable chapter in the history of municipal reform.

The result of all this was the drawing of a comprehensive and a scientific bill creating a Board of Health, with power to abate nuisances "dangerous to life and detrimental to health," and providing that this Board should not be subjected to interruption through injunction The Board was empowered to create its own ordinances, to execute them, and to sit in judgment on its own acts, without interference by the courts [13] This bill was introduced in the legislature of 1865 It was sponsored at a public hearing by the Rev Henry W Bellows, one of the founders of the Union League Club, Dr Willard Parker, Prof John W Draper and other leading citizens [14]

Dr Stephen Smith then addressed the Legislative Committee What he said was a revelation of the all but incredible conditions then existing in New York He told of the inspection which had been made by a house-to-house canvass, and the results thereby revealed He told of the filthy streets which had become the receptacle of refuse, filled with house-slops, decayed fruit, store and shop sweepings, ashes, dead animals, and even human excrements He spoke of filthy alleys,

LEGAL

Counsel, Medical Society of the State of New York

THE ORIGIN, AUTHORITY AND FUNCTION OF THE HEALTH DEPARTMENT

The subject suggested by this title, which we shall make the eighth in our promised series of editorials, is so large that it might well fill a whole book, instead of a single article A study of the origin and growth of our Health Departments would form an interesting chapter and a commentary upon the development of the science of medicine, and especially of the gradual but sure recognition on the part of laymen, legislators and public officers of the truths of science and of the necessity to observe and to comply with them

For more than two and a quarter centuries, that followed the founding of New York City, there was practically no specialized public health regulation of its inhabitants "The land was practically undrained, the drinking water was from shallow wells, befouled by street, stable, privy, and other filth, there were no adequate sewers to remove the accumulating waste, the streets were the receptacles of garbage, offensive trades were located among the dwellings, the natural water courses and springs were obstructed in the construction of streets and dwellings, thus causing soakage of large areas of land, and stagnant pools of polluted water Later, in these centuries of neglect of sanitary precautions, came the immigrants from every nation of the world, representing for the most part the poorest and most ignorant class of their respective nationalities This influx of people led to the construction of the tenement house by landowners, whose aim was to build so as to incur the least possible expense and accommodate the greatest possible number In dark, unventilated, uninhabitable structures these retched, persecuted people were herded together, in cellars and garrets, as well as in the body of the building, until New York had the greatest population to a square acre of any civilized city The people had not only chosen to conserve all the natural conditions unfavorable to health, but had steadily added unhygienic factors in their methods of developing the city "[1]

The result which followed was inevitable New York City became the home of every variety of contagious disease and the favorite resort of foreign pestilences Smallpox, diphtheria, scarlet fever and measles became so familiar that the people regarded them as the unavoidable consequence of childhood The mosquito-infected marshes were culture-beds for malarial fevers Consumption or the "white plague" as it was then known, befell rich and poor alike To these diseases, were added typhus and typhoid fevers which the immigrant brought with him These maladies swept through the tenement houses, striking down and decimating the poor inmates At times, from the Orient, there came the Asiatic cholera that fell upon the city like an alien conqueror, and gathered in its arms an army of the dead From the tropics, yellow fever now and then appeared and found an unrestricted field for pestilential operation

Effective allies for these enemies of mankind were found in the large increase of the tenement house population, offensive trades, accumulation of domestic waste, and the filth of stables, streets and privy pits In 1865 in New York City there were five deaths reported for every birth, 60 per cent of which were children under 20 years of age In 1927 the official returns in the death rate of New York City were 21 5 for a thousand population[2] This compares most favorably with all other cities of the world

During the same era, England was making but scant headway against disease In 1832, cholera was raging It was believed to be a "visitation of God," against which the only preventive measures were "flight, fasting, and prayer" At the height of this scourge in 1849, the clergy petitioned the Prime Minister to proclaim a day of "fasting and prayer," expressing the belief that the visitation was God's punishment for national vices The Prime Minister, with sound common sense, and an unconscious recognition of the laws of science, answered "Do works meet for repentance First make your homes and their surroundings clean and wholesome, then you may with propriety ask Almighty God to bless your efforts at protection against the approaching epidemic "[3] The religious classes received the Prime Minister's response with sheer astonishment, but the sanitarians even at that early day commended him The people, however, obeyed neither the Prime Minister nor the clergy, and neither fasted, prayed nor cleaned their homes[4]

It was, however, noticed at this time that a small town in the interior of England reported no case of cholera, despite the prevalence of the epidemic elsewhere in the British Isles On searching for the causes of this town's immunity, it was soon found that the leading men and women of that town had gone to work, with the result that streets and public places had been cleaned, every residence and its surroundings had been inspected until all filth had been removed, and those possessing even the smallest symptom of cholera

failures Almost immediately after its organization, it attacked the problem of cholera, it began the scientific study of disinfection In 1869 it started a long crusade against venereal disease and at the same time began its campaign against watered milk It attacked yellow fever, smallpox and typhus In 1874 it launched upon a war against infant mortality and in the same year established a laboratory for the preparation of vaccine virus In 1875 the study of pneumonia was begun in real earnest, and in the same year its report on hydrophobia was issued In 1887 Dr O'Dwyer published his article describing the operation of intubation, the importance of which was demonstrated in the hospitals of the Department of Health In 1892 Dr Ernest J Lederle, acting chemist of the Health Department, began his great work in furtherance of pure milk Four years later the Sanitary Code was amended so that no milk would be sold in the City of New York without a permit in writing of the Board of Health On January 1, 1895, under the leadership of Doctors Biggs and Park of the Health Department, the first anti-toxin produced in the laboratories of the Department, became available for use in hospitals and distribution without charge among the poor of the city Two years later, following a trial of this plan by the city of Boston, the inspection of public school children was begun

The record of achievements on the part of our local Health Department would fill a long and interesting chapter The names of the various physicians who served as commissioners of health or in other important positions in the Health Department of this city would bulk large in any record of the public-spirited leaders of the medical profession Among these might be mentioned Doctors Stephen Smith, Edward G Janeway, Ernest J Lederle, Ph D, Thomas Darlington, S S Goldwater, Haven Emerson and a long list of others

It was not until 1893, that by Chapter 661 of the laws of that year that a full and comprehensive organization of the New York State Health Department was begun The State Department has supervision over the public health of the entire state, except the City of New York, over which it has no jurisdiction [22] There are local health boards in all of the various cities, villages and towns of the state, each under the general supervision of the State Health Department [23] Each town and village has its own health officers and inspectors

In New York City, with its own Board of Health and in the other towns and cities under the supervision of the State Board, modern civilization has set up these public bodies to safeguard the public health, and through the discoveries of science to prevent the scourge of pestilence or plague and all preventable and communicable diseases, which less than three-quarters of a century ago, periodically were wont to terrify the population and to bring their desolations more awful and extensive than the casualties of war

open privies and cesspools, of slaughter-houses conducted in congested tenement house areas, of people living in damp, unwholesome quarters underground, of "Cat Alley," a group of dilapidated tenement houses on Cannon Street, of "Rag Pickers Row," of all the seeds of disease uncontrolled, of smallpox, dysentery, typhus, and typhoid and scarlet fever, due to domestic filth, overcrowding and deficient ventilation, of cholera infantum, the high death rate, the constant sickness, the filthy habits of new immigrants, and how cleanliness would preserve the city from the ravages of epidemics He told of one Delaware merchant who came to a New York hotel, and later found that the room had just been occupied by a smallpox patient, that had not since been cleansed, and how that merchant contracted the disease and died He told that there was no efficient body or board then in existence having jurisdiction to prevent, to control these horrible conditions

He advocated a law whereby a Board of Health should be created, which should be independent of all political control, which should combine executive ability with the knowledge of disease and the proper measures of prevention It should have upon its staff a corps of skilled medical inspectors who would seek out disease and investigate its causes—a Board that would have a close alliance with the police department Such inspectors as were then employed were ignorant, political appointees Their capacity for their work was revealed by the answer of one of these who, when asked to define "hygiene," replied that "It is a mist rising from wet grounds"[15]

The efforts of the promoters of this new law met at first with failure The bill introduced into the legislature of 1865 did not pass, but the public and especially the medical profession by this time had been aroused The proposed health measure became an issue in the campaign of 1866, as a result of which seventeen candidates for the legislature, who had opposed the law, met defeat In 1866, the reform measure was adopted, and became Chapter 74 of the laws of 1866, entitled "An act to create a metropolitan sanitary district and Board of Health therein for the preservation of life and health and to prevent the spread of disease" This statute was a well drawn and thoroughgoing measure It was the parent of our present statute on this subject

The Health Department of the City of New York thus came into existence Under the broad powers given it, the city was cleaned up, and long strides were made in the prevention of communicable diseases

The present law defining the duties and the powers of the New York City Board of Health is found in Chapter 19 of the Greater New York Charter Under this statute, the enforcement of all laws applicable to the care, promotion or protection of health in the City of New York is vested exclusively in the Department of Health[16] The statute declares that it shall be the duty of the Board of Health "to aid the enforcement of, and so far as practicable, to enforce all laws of this state, applicable in said district (the Greater City of New York), to the preservation of human life, or to the care, promotion, or protection of health, and said Board may exercise the authority given by said laws to enable it to discharge the duty hereby imposed, and this section is intended to include all laws relative to cleanliness, and to the use or sale of poisonous, unwholesome, deleterious, or adulterated drugs, medicines or food, and the necessary sanitary supervision of the purity and wholesomeness of the water supply and the sources thereof for The City of New York"[17] It is given authority to isolate those afflicted with contagious, pestilential or infectious diseases It authorizes the Board to add to, alter or amend any part of the Sanitary Code, and to pass additional provisions "for the security of life and health in The City of New York" Any violation of the Sanitary Code is constituted a misdemeanor[18]

The Board of Health is thus given a vast power and authority One of its powers is "In the presence of great and imminent peril to the public health by reason of impending pestilence to do and order, and cause to be done, such acts and make such expenditures (beyond those duly estimated for or provided) for the preservation of the public health as it may in good faith declare the public safety and health to demand, and the mayor shall in writing approve"[19] It has power to appoint sanitary inspectors and sanitary superintendents to make examinations and surveys

The police department is specifically enjoined promptly to "advise the department of health of all threatening dangers to human life or health, and of all matters thought to demand its attention," and is required to "co-operate for the promotion of the public health and the safety of human life in the city" The members of the police department are required to "enforce and execute the sanitary rules and regulations and the orders of said Board of Health"[20] The Board of Health may make requisition upon the Police Commissioner "for the detail of not more than fifty suitable officers and men of at least five years' service in the police force, who shall be selected for their peculiar fitness for the enforcement of the provisions of the sanitary code."[21]

Running on through the various provisions of the statute, it is seen that the Board of Health is given vast powers for the protection of the community Not only is it vested with powers of legislation so far as amending or changing the Sanitary Code is concerned, but in furtherance of the prevention of the spread of contagious diseases, the violation of any order which it issues is made a misdemeanor

Since its organization, the Board has many brilliant triumphs to its credit and of course, some

Rules

Papers to be presented before the State Meeting must come in one of the three following classes

1 They must contain new facts, methods of practice, or principles of real value
2 They must contain the results of well-devised original researches
3 They must present so complete a review of the facts on any particular subject that the writer can deduce therefrom proper conclusions of importance

A typewritten paper must be handed to the presiding section officer as soon as it is read

A discusser who wishes to have his discussion published must hand it to the secretary of the section before the close of the annual meeting

All papers presented before the meeting become the property of the Society

All papers shall be submitted to the Publication Committee for publication in the NEW YORK STATE JOURNAL OF MEDICINE

It is recommended that the House of Delegates, Council and Executive Committee do not permit the publication of a paper in advance of its reading

Only those members of the medical profession of New York State who are members of the Medical Society of the State of New York may take part in the Scientific Program

Professional men in other fields and states may be invited to address the Society

Any member who has permitted his name to be listed on the program as intending to present a paper or open a discussion, and has failed to attend the session or to give a satisfactory explanation for his absence, shall not be eligible to present a paper before the Society until three years have passed

No paper on the program shall be presented out of its proper order

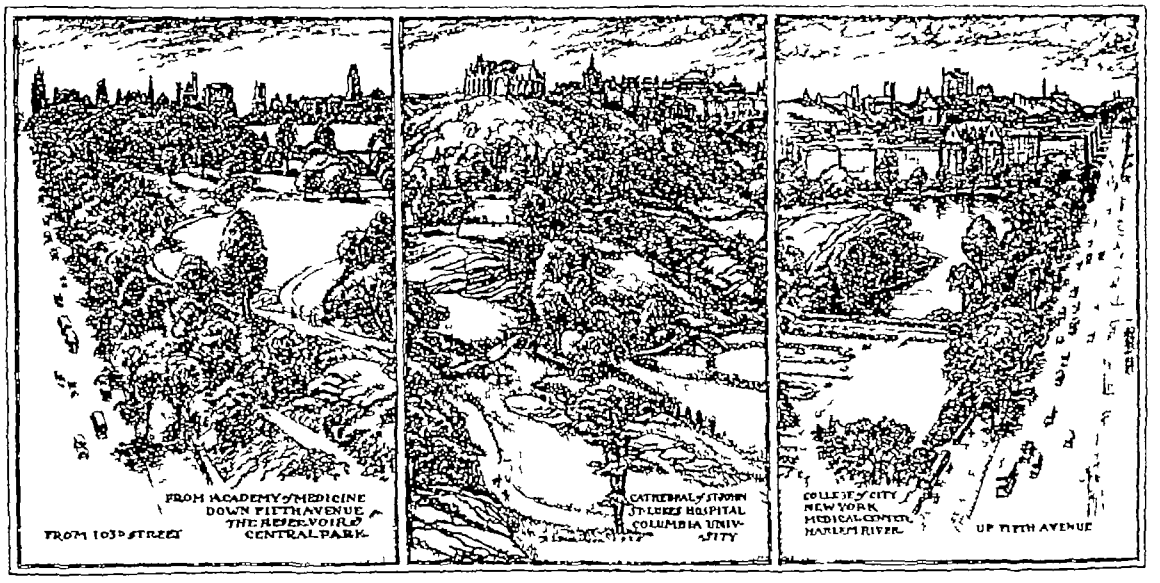
The time allowed for the presentation of a paper shall not be more than twenty minutes

The speakers appointed to open the discussion shall be allowed ten minutes

Each subsequent speaker will be given five minutes

No member may speak twice on the same subject unless unanimous consent of those present is given

Every member shall receive a copy of these rules when assigned to a place on the program



ARTHUR J BEDELL, *Chairman*

PUBLIC RELATIONS COMMITTEE, REPORT TO THE COUNCIL

The Public Relations Committee is keenly impressed with the importance of its task and the tremendous amount of work that will be required before we have a harmonious and working cooperation between the three great agencies concerned in the development of better health conditions in our state I refer to the medical profession, State Department of Health and voluntary health organization, all of which, at the present time, are working more or less alone, and without that force which would ensue from a proper coordination of effort and a definite interlocking of activities, with the medical men in each locality assuming their normal position as leaders, advisors, and active participants in all that has to do with the health, present and perspective of our citizens Likewise are we conscious of the fact that lay organizations, in most instances, have assumed the initiative and with their excellent organization having definite working units in each county are able to dominate health activities both to the disadvantage of the medical profession and questionable advantage of the general public

Your committee was organized during 1926 and up to the present year its activities dealt largely with conferences with leaders of lay organizations and the State Department of Health, relative to agreements and plans defining their respective fields of influence and work In theory this seemed to be the practical and essential plan of action, and probably would have been successful were it not for the violent outbreak in one of our counties between the medical society and lay organization, demonstrating the strength of the latter body and proving to the medical men that in the future they must take a greater interest in civic medicine, and furthermore, that they must perfect their organization to such an extent that in each county there must be a committee whose duty consists of correlating all of the forces working within its borders that have to do with health conditions Therefore, the Committee on Public Relations at its organization meeting held in Albany, July 7th, 1928, determined that it would be necessary to perfect a definite organization by having a Public Relations Committee in each county medical society, which committee could be held responsible to see that the agencies working for the betterment of health within the county were coordinated, and that the medical men assume their proper position as leaders, advisors and participants in all civic medical activities Hence the state was divided and approximately twelve counties allotted to each of the five members of the committee, with the understanding that such member would personally see to it that each of his counties would organize a County Public Relations Committee composed of the best

NEWS NOTES

VIEW FROM THE NEW YORK ACADEMY OF MEDICINE

A Christmas Card from Dr R L Dickinson

Dr Robert L Dickinson of New York City sent to the Editors of the NEW YORK STATE JOURNAL OF MEDICINE one of his Christmas cards which is here reproduced It shows sections of the view from the New York Academy of Medicine, looking south, and northwest and north, with Central Park in the foreground The silhouette shows a skyline of institutions of learning, ecclesiastical, medical, and of the arts and sciences, such as few cities can match, for it ranges from the free high school on the extreme right to the building of the movies on the left, topped with the globe as its symbol

The original drawing which is the kind that runs out of Doctor Dickinson's fountain pen, is about eighteen inches in length The drawing was given to the Academy

The card to the editors reads

"Hearty Greeting, 1928

"Medicine ought to have this kind of wide horizon, facing religion and higher learning across an oxygenated out-of-doors The Medical Center on the right is rather a dominating Norman keep, but it represents Research Uplifted, and not Dogmatism"

COMMITTEE ON SCIENTIFIC WORK

The Standing Committee on Scientific Work of the Medical Society of the State of New York held its first meeting at the University Club, Albany, N Y, July 3rd, at one o'clock Members present Dr Bedell, Chairman, and Drs Trick, Gibson, Kingsbury, Lichty, Leo-Wolfe, Munson, Weed and Lawrence Valid excuses were received from the remaining members of the committee

It was voted that the scientific program of the annual meeting should consist of general sessions on the afternoons of Tuesday and Wednesday, and that the mornings of Wednesday and Thursday be given to the usual section meetings

The innovation will prove to be a decided benefit to every member of the Society The Tuesday afternoon session will be under the general direction of the Chairman of the Section of Medicine, and the Wednesday afternoon meeting will be under the supervision of the Chairman of the Section of Surgery

It was decided that the following rules and regulations be submitted to the Executive Committee of the State Society for approval

This resume shows that the number of articles dealing with subjects in which the Committee on Public Relations is directly interested in is as follows

News Items	22
Editorials	15
Items on health activities in other states	22
Total	59

We are pleased to note that through the initiative and effort of the Ontario County Medical Society there has been established, under a full time medical director, a County School Health District for that county A similar plan has been established and such School Health District developed by combining a number of the townships in the western part of Montgomery County

We note with pride that the physicians of Oneida County are cooperating wholeheartedly with two governmental agencies of the state—Department of Health and Department of Education—in making a survey of the physically handicapped children in that county, although the survey was initiated without full consultation with the Oneida County Medical Society This is an example of excellent cooperation with other agencies, thereby placing the local medical profession in a strong position with the public This satisfactory solution was brought about through the efficient work of the Public Relations Committee of the Oneida County Medical Society

Your committee feels encouraged and activated by the many inquiries from medical men throughout the state asking for information relative to methods in working out the problems for cooperation with other existing agencies in their district This committee feels that its immediate future work consists in establishing contacts with the county societies and helping them with their problems At the same time many contacts and conferences with state-wide governmental and voluntary organizations will be necessary before proper coordination is obtained and the medical profession assumes its proper position and responsibility in the field of Public Health and Preventive Medicine

JAMES E SADLIER, M D
Chairman, Public Relations Committee, Medical Society, State of New York

CLINTON COUNTY MEDICAL SOCIETY

The annual meeting of the Clinton County Medical Society was held on November 20th, 1928, at two o'clock, at the Witherill House, with twenty-four members and guests present

The meeting was preceded by a luncheon at the Witherill House at 12 30 P M

The report of the Treasurer showed a deficit of over $40, and on motion an assessment of

men of their respective counties, men of known ability as leaders Such county committees are to be instructed to make a survey of health activities at present operative in said county, together with all plans and possibilities for future development of an enlarged scope of activity, and each survey as it is made, is to be published in the NEW YORK STATE JOURNAL OF MEDICINE Further information relating to such survey is contained in the editorial written by Dr William H Ross, and published in the November 15th, 1928, issue of this Journal, page 1363

This work of organizing the counties and developing their Public Relations Committees to a standard adequate to meet present conditions, and also, to make these necessary health surveys will, of necessity, be a slow process and involve the expenditure of much time upon the part of each member of the committee, probably entailing several visits to each county medical society before we have such committees working satisfactorily We are anxious to make progress along substantial lines, and we point with pride to the advancing health conditions in Suffolk County, where the medical men are in charge of all health activities and have already established, without outside aid, a County Health Department, the first to be organized by the medical men of a county We are cognizant of the fact that one other county—Chautauqua—has declared itself in favor of such plan and is developing along similar lines In Dutchess County a most satisfactory coordination exists between the medical profession and lay organizations whereby the Public Relations Committee of the County Medical Society directs the health activities of the county to the satisfaction of all concerned

In order to hasten the formation and to activate the Public Relations Committee in each county society, the chairman of your committee met with all the District Branch Medical Societies of the state at their recent annual meetings, and addressed them upon the importance, to our State Committee, of establishing these county units, and especially advised them with reference to the appointment of leading men as members of such committees In this I received able assistance from the secretary of our committee, Dr Ross, who also visited and addressed several of the District Branch Societies, urging the importance of this great duty of the medical men of organized medicine and its responsibilities

Your committee has adopted the Eight General Principles which were evolved by the Council Conference Committee of your society in conjunction with representatives of Cattaraugus County Medical Society, State Charities Aid Association and Milbank Fund, and were adopted by the House of Delegates of the Medical Society of the State of New York, May 21, 1928, for the purpose of guiding and directing conjoint work between the medical profession and lay organizations in all county civic activities dealing with health

Likewise has it adopted the program devised by the committee on Public Relations of last year, which consists of five definite points of activity for the County Medical Societies, Public Relations Committees These Eight General Principles and Five Points have been published in three different issues of the State Journal, and will receive wider distribution in the near future by being sent as a pamphlet to various officers and committeemen of the county medical societies.

Through the courtesy of our Publication Committee, the Editor, and the Executive Editor of our Journal, we have been favored with an exceptionally large amount of publicity consisting of editorials and reports dealing with the subject of public health and public relations We are especially indebted to Drs Ross and Overton for their work along this very necessary line of medical publicity It is hoped that our entire membership in reading these editorials will include the following list of public health and public relation items in the NEW YORK STATE JOURNAL OF MEDICINE, July 1, 1928 to December 15, 1928

SUFFOLK COUNTY

From the November issue of the News Letter of the Suffolk County Medical Society

The one hundred and twenty-second annual meeting of the Suffolk County Medical Society was held on Thursday, November first in the Country Club, Riverhead The meeting was called to order at noon by the president, Dr F S Child of Port Jefferson, with thirty-three members present. Public Health nurses and the wives of the members brought the attendance to over fifty. A brief business session was followed by a dinner, while the afternoon was devoted to scientific addresses The meeting was one of the best attended and most interesting that have ever been held The report of the treasurer showed that ninety-three paid-up members were on the rolls, and a balance of $400, in the treasury

The first order of business was the reports of officers and committees Dr William H Ross of Brentwood reported that the Legislative committee had kept track of the legislative bills affecting medical practice and health One hundred and six such bills had been introduced, and all that were dangerous to health had been defeated However, since the Medical Practice Act had been adopted in 1926, the medical profession had not sponsored *any* bills of great importance

Dr Ross reported that the Medical Practice Act was being enforced with efficiency by the State Department of Education and the Attorney General, and that the physicians themselves had been relieved of the duty of investigating complaints of illegal practice, as was the case under the former law A quack of whom a doctor made complaint would set up the plea that the physician was jealous of him, and was acting in self interest, but now the doctor has nothing to do with investigations and complaints

Dr Frank Overton, chairman of the Committee on Public Health reported that the outstanding public health accomplishment of the past year was that of securing the authorization of a County Health Department This would be a great step toward the realization of the ideal of the medical profession—medical service, in all forms, to all classes of persons.

Dr W H Ross described the work of the Cancer Committee and said that it was prepared to supply lectures to civic clubs and societies in every village The lecturers would explain the nature of cancer and the means of its detection and control They had reported that the people generally were ignorant of the modern conception of cancer and were often in needless fear of the disease Medical science could now offer the hope and expectation of cure if the people would accept it

On motion it was voted that a physician in each village should have charge of making arrangements for lectures in his locality

The secretary, Dr E P Kolb, reported that he had received a set of standing orders for the guidance of the public health nurses in their calls upon sick persons before a doctor had arrived On motion the orders were referred to the Comitia Minora for investigation with a view to their approval

Dr F S Child gave the presidential address in which he outlined a plan of examining persons who were presumably healthy, by which the facilities of the general hospitals and their laboratories could be utilized to give a person a complete health audit along the lines of that of the Life Extension Institute This plan received the formal approval of the Society

The sickness of Dr C C Miles, a past president of the Society, was announced and the Secretary was authorized to send him flowers and a letter of greeting

The principal address of the day was given by D Joseph H Globus of 1125 Park Avenue, New York, on the subject, "Cerebral Apoplexy"

Dr Globus received the attention of his audience for an hour and a quarter while he described the modern conceptions of apoplexy He especially emphasized the possibility of detecting the premonitory symptoms of apoplexy and of guarding against its onset, thereby adding years of usefulness for many persons The address was clear and pleasing and drew the commendations of the wives of the doctors as well as the medical men, for whom it was intended.

Officers were elected as follows

President—Dr E R Hildreth, Bay Shore
Vice-President—Dr A E Payne, Riverhead
Secretary—Dr E P Kolb, Holtsville
Treasurer—Dr G A Silliman, Sayville

The choice of censors and delegates to the State Medical Society was left with the Comitia Minora

Dr A C Bowen of Smithtown was elected to membership, and Dr Maria Vinton of Brightwaters and Dr William Neuss of Yaphank were accepted as members by transfer from other County societies

E P Kolb, *Secretary*

SENECA COUNTY

The Semi-annual meeting of the Seneca County Medical Society was held at Willard State Hospital, Willard, N Y, on Oct. 11, 1928, Dr E W Bogardus, President, presiding

The following officers for the ensuing year were elected by unanimous ballot

President, Dr W M Follette, Seneca Falls,
Vice-President, Dr A. J Frantz, Seneca Falls,

$2 per capita was voted to be levied in addition to the regular dues for 1929

Dr Schiff reported on the progress made for post-graduate instruction, and also on the coming meeting of the State Society

Dr William L Munson, President of the Fourth District Branch, spoke of the plans for a meeting of the Fourth District Branch next fall

The following officers were elected President, B R Webster, Dannemora, N Y , Vice-President, A S Schneider, Plattsburgh, N Y , Secretary, Leo F Schiff, Plattsburgh, N Y , Treasurer, F K. Ryan, Plattsburgh, N Y , Censors, Drs Rogers, deGrandpre, and Macdonald, Delegate, Leo F Schiff, Alternate, A S Schneider

Dr McDowell stated that he had appointed a Committee consisting of Drs Everett, Ryan, and Schiff to draw up resolutions in respect to the memory of Drs Clough and Larkin, and the Committee reported with the resolutions which were accepted and appear as part of these minutes on a separate page

A motion to endorse the action of the State Sanitary Officers Association in requesting the State to provide for official automobile license registration for physicians was adopted unanimously

Dr E S McDowell gave the President's Address and chose as his subject "The Place of the Private Practitioner in Preventive Medicine" At the conclusion of this address, it was voted that the President appoint a committee of which he should be the Chairman, to study conditions of maternity in Clinton County and report at the annual meeting in 1929 The President appointed Drs Sartwell and Schiff

Dr I S Haynes read a paper on "The Lumbo-sacral Spine as one Source of Backache," illustrated with X-ray films and pictures This was discussed at length by Dr C D Silver

Dr D T Smith of Ray Brook delivered a lantern slide lecture on "Diagnosis and Treatment of Fuso-spirochetal Diseases of the Lung," taking up both experimental and clinical phases of these conditions Discussion by Drs Houghton, McDowell, Silver, Schiff, and Munson

The President publicly thanked the speakers who had given of their time to make this interesting program, after which the meeting on motion adjourned

LEO F SCHIFF, *Secretary*

SARATOGA COUNTY

The Annual Meeting of the Saratoga County Medical Society was held at Saratoga Springs, Wednesday, Oct 24, 1928, and was opened with a clinical demonstration at two o'clock at The Saratoga Hospital

The members of the Saratoga County Medical Society were invited by the President, T J Goodfellow, to a banquet at 6 P M at the Y M C.A , Saratoga Springs, N Y Following the banquet the business program was taken up

The president appointed the following as a nominating committee Drs King, Van Doren, and Castree, who reported the following nominees

President, T J Goodfellow, Vice-President, A W Johnson, Treasurer, John Maby, Secretary, R B Post, Censors, G H Fish, F Gow, E H King, Delegate to State Convention, G Scott Towne, Saratoga, Alternate Delegate, J MacElroy, Jonesville

These members were duly elected to office

Motion made and seconded that all members who have been in active practice for a period of fifty years shall be given a life membership in The Saratoga County Medical Society, and their dues to the New York State Medical Society be paid from the treasury of the Saratoga County Medical Society, dating from Jan 1, 1929 Carried

Motion made and seconded that the Saratoga County Medical Society extend an invitation to the fourth district branch of the Medical Society of the State of New York to hold its next annual meeting at Saratoga Springs, N Y Carried

Motion made and seconded that we go on record as favoring the resolution of the New York State Sanitary Officers Association in regard to special automobile number plates for physicians' automobiles

The report of the Treasurer was next read and accepted, also the report of the delegate to the State Convention

Dr MacElroy reported progress in regard to presenting a health program to the Board of Supervisors

The guests of honor at our banquet, those doctors who have been in practice fifty years or more, namely Drs Gow, Cotton, Crombie and Stubbs, gave short addresses relating their experiences

Dr M J King, of Mt McGregor, gave a very interesting paper on "Calmette's Vaccine"

Dr C R Comstock gave an interesting discourse on "Some Impressions of an European Trip"

A rising vote of thanks was given to our president, in recognition of the gracious manner in which he entertained the members of the Saratoga County Medical Society

R B POST *Secretary*

Jaques, M D, Lynbrook, executive secretary, J Louis Neff Rockville Centre, board of censors B R Allison, M D J W Bulmer, M D, Ernest Dickey, M D, G A Fensterer, M D, E C Jessup, M D, delegate to State Society for two years Louis A Van Kleeck, M D, alternate Albert M Bell, M D, alternate to Dr Fensterer whose term of office carries over from last year, G Borden Granger, M D, delegate to Second District Branch, M R Jackson, M D

The committees appointed for the purpose of investigating the desirability and possibility of securing, for the County, a central hospital and a public laboratory, reported considerable work accomplished, and in the near future hopes to be able to announce a definite constructive program for these two important needs of the county

The Committee on Post-graduate Education announced that, because of the success of the previous programs, there would be conducted during the season of 1928-29 a larger series than had previously been undertaken These lectures have already been started with three scheduled for November and three for December Beginning with the new year, we shall conduct these lectures on Thursday afternoon at 4 p m in Nassau Hospital

The report of the Secretary-Treasurer showed a net gain in membership in spite of the unusually large loss during the year because of death, removal from the county, and election to retired and honorary membership The financial condition of the Society is sound and shows an improvement over that of last year

The Nursing Committee made a preliminary report on the survey of the nursing condition in the County, and announced that in the beginning of the new year active steps would be taken to remedy certain conditions now existing because of the lack of cooperation of several registries

Acting upon the recommendations of the same committee, the Society voted to approve the standing orders for visiting nurses, drawn by the Queens County Medical Society for the use and guidance of nurses of the Metropolitan Life Insurance Company

The Medical Society was appealed to for assistance in the matter of the misunderstanding which has arisen between the Cancer and Tuberculosis Committees

Dr Bell, retiring president, reviewed the activities of the Society for the past year and outlined the unfinished business which would have to be taken over by the new president, but made it evident that this unfinished business is in such shape that the incoming administration could reasonably expect to witness further advances in the activities of the Society

A letter was read from Dr Charles H Ludlum of Hempstead, who is the second oldest living member of this Society Dr Ludlum was recently elected to Honorary membership, and this action caused him to reminisce in a very interesting fashion He wrote

"When I began my interne service at Bellevue Hospital in the Spring of 1865 we were at the dawning of a new day Cammann and Loomis were teaching auscultation and percussion, and we introduced the fever thermometer and hypodermic needle during my service, I believe. We also learned that cleanliness was essential to successful surgery"

The Society has opened an executive office at 457 Franklin Ave, Mineola, directly opposite the Court House, and employ full-time executive and clerical assistants

A D JAQUES, M D, *Secretary*

CHAUTAUQUA COUNTY

The annual meeting of the Medical Society of the County of Chautauqua was held at the White Inn, Fredonia, N Y, on Wednesday, December 12, 1928 A business meeting was held at noon, followed by a dinner A scientific session was held immediately after dinner

The following were elected to office for 1929 President, Dr B S Swetland, Brocton, N Y, vice-president, Dr F J McCulla, Jamestown, N Y, secretary, Dr Edgar Bieber, Dunkirk, N Y, treasurer, Dr F J Pfisterer, Dunkirk, N Y

Dr A H Aaron, of Buffalo, gave a most interesting and instructive talk on "Recent Advances in Gastro-Intestinal Therapy"

EDGAR BIEBER, *Secretary*

Secretary and Treasurer, Dr R F D Gibbs, Seneca Falls, Delegate to State Society, Dr R M Elliott, Willard, Alternate, Dr R S Pettibone, Willard, Delegate to 7th District Branch, Dr A L Letellier, Alternate, Dr F W Lester, Censors, Drs F W Lester, L W Bellows, C B Bacon

Dr Lester reported on the State Society, and Dr Letellier on the Seventh District Branch meetings

On motion a committee of three composed of Drs Brown, Cole and Gordon was appointed by the President as a public relations committee to cooperate with lay organizations as to public health

The Secretary was instructed to report to the State Education Department any physicians in Seneca County not properly registered

It was decided to hold the May meeting in Romulus, N Y

A paper on "Certain Forms of Heart Disease and Their Management" was read by Dr Herbert Schoonmaker, of the Clifton Springs Sanatorium The paper and the discussion brought out many points of great value and interest to all present

The members voted unanimously thanking Dr Elliott for his courtesy as host of the Society

R F Gibbs, *Secretary pro tem*

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at the Concourse Plaza, on November 21, 1928, was called to order at 9 P M, the President, Dr Gitlow, in the chair

The following candidates were elected to membership

Jacob Belenky, Harold C Brinn, Harry H Epstein, Abraham Feitelberg, Peter Gaetano, Anthony C Galluccio, Aaron N Gorelik, Irwin I Koslin, Joseph J Kowles, Harry S Mackler, Irwin Mason, Lawrence J McTague, Zalmon A Paperny, Bernard Rabinowitz, Dickinson C Richards, Morris B Schwartzfarb, Augusta Skodnick, Stanley H Steiner, Israel Weinraub

Dr Magid, Chairman of the Committee on Medical Economics, submitted the Report of the Committee on the subjects of formulating definite plans for social service investigation and study in Hospitals and Dispensaries, and conducting a Credit Bureau for the benefit of the membership of the Society General discussion followed on the matter of Hospital and Dispensary abuses, It was moved and carried that additional men be added to the Committee on Medical Economics for the purpose of further study of this matter It was then moved and carried that the Report of the Committee as read be accepted by the Society

Dr N B Van Etten, Chairman of the Committee on Public Relations, submitted the Report of the Committee, with special reference to the Campaign to rid the State of New York of Diphtheria He emphasized the splendid work that has been done outside of New York City and stated that the City of New York should be and now is an active participant in this campaign The committee has held two meetings recently Dr Van Etten urged the doctors to further this campaign of toxin-antitoxin immunization, and to do the work themselves The Committee recommends that all available agencies in the Bronx, under the direction of the Bronx County Medical Society, be utilized to propagandise the citizens of the Bronx Our recommendation is not to allow health agencies to carry on this treatment, but to have everybody go to his own doctor The committee further recommends the appointment of a special diptheria committee comprehensive enough to reach as many lay organizations as possible and to enlist as much assistance, lay and medical, as is possible in this matter It was moved and carried that the report be accepted and that the chair appoint a special committee as suggested by the chairman of the committee on public relations

A Report was received from the Committee on Public Health and Medical Education, which dealt chiefly with the subject of baby health stations The committee is making a thorough study of this subject and will submit a complete Report within the near future

The scientific program consisted of a paper on the Diagnosis and Treatment of Infections of the Hand illustrated with a motion picture by Henry W Cave, M D

I J Landsman, M D, *Secretary*

NASSAU COUNTY

The annual meeting of the Medical Society of the County of Nassau was held on November 27th at the Rockville Country Club, Rockville Centre, N Y

The following officers were elected for 1929 President, Roy D Grimmer, M D, Hempstead, vice-president, Leander A Newman, M D, Port Washington, secretary-treasurer, Arthur D

THE DAILY PRESS

THE HEALTH OF THE PRESIDENT

How a man can preserve his health when he is threatened with submersion beneath a load of care and work has been frequently discussed, and many have been the articles reciting the exercises and the diets followed by those who are prominently before the public The most scientific and sensible of all the articles is that written by President Calvin Coolidge to the editor of the *St Louis Post-Dispatch* on the fiftieth anniversary of the establishment of the newspaper Discussing his own health the President is reported by the *New York Herald Tribune* of December 10, as saying

"As a President about to retire, I feel at liberty to write of certain phases of that office which one who was entering upon its duties might feel some hesitation in discussing I shall briefly express my opinion concerning a subject which is often broached but about which nothing is ever done, although it is recognized by everyone as a matter of the gravest importance I refer to the health and physical condition of the President, not so much for my own sake as for my successors I have often remarked that at least I had one distinction I have been the healthiest President that the country has ever had

"My ability to keep well has not been due to a particularly robust constitution or any extraordinary efforts in physical exercise My habits have been regular It is seldom that I have been late at meal time and I have avoided keeping late hours Very little work has been done before breakfast, but usually I have taken a short walk and, during the winter season, a more extended walk before dinner, which has been my chief mode of exercise. I have kept a couple of vibrating machines in my room which I found helpful It will be seen that in the matter of exercise my efforts have been toward a conservation of time Such activities have been adopted as could be put into operation at once, without the necessity of a change of clothing or travel to some other location before exercise could begin

"At the time I took office there was considerable discussion of what could be done to remove all unnecessary burdens from the President Some legislation was proposed I did not look upon that with much sympathy, perhaps, because unconsciously I may have felt it would be a declaration of weakness, but certainly because my experience in public office made me know that whether I was to be overburdened with work and broken down in health depended more on myself than any act of Congress

"The duties of the Presidency are exceedingly heavy The responsibilities are overwhelming But it is my opinion that a man of ordinary strength can carry them if he will confine himself very strictly to a performance of the duties that are imposed upon him by the Constitution and the law If he permits himself to be engaged in all kinds of outside enterprises, in furnishing entertainment and amusement to great numbers of public gatherings, undertaking to be the source of inspiration for every worthy public movement, for all of which he will earnestly be sought with the inference that unless he responds civilization will break down and the sole responsibility will be on him, he will last in office about ninety days There are certain addresses which the President must make, certain appeals to which he may respond, like this one which you have made to me But in the vast majority of cases he must and should decline

"It is, of course, obvious that the President should not burden himself with details Those should be attended to by his departments and his office staff He should not do any work that he can have done by others Such energy as he has should be directed not so much toward doing work as making certain that the work is being well done"

THE BIRTH OF FOLK SONGS

It has always been a mystery who composes negro folk songs and how The New York *Times* of November 24 records a new spiritual within a few hours after its birth, but its parentage was undiscoverable The account reads —

"A new spiritual was born of the Florida typhoon Red Cross officers, working in the desolation about Lake Okechoobee, heard the negroes singing it as they floated about on rafts, refugees from the storm The Red Cross men do not know who started the song, for negroes while about such business of composition as this frequently build their songs up of separate lines— one person singing the first one and the rest adding to it as they go The result was—

MEDICAL WARES

THE REFRACTOMETER

The refractometer is one of the instruments of precision used in laboratories for research and clinical diagnosis It is also in common use in industry for the purpose of determining the percentage of an ingredient in a liquid, *as in sugar making*

The refractometer is an application of the principles of refraction, or the bending of rays of light as they pass through substances of different densities The simplest illustration of refraction is the apparent bending of a stick thrust obliquely into water The rays of light emerging from the water are bent on entering the air on the surface of the water Rays are also bent when they enter the water from the air, and when they enter or emerge from a prism or lens The amount of bending is called the *index of refraction,* and is a constant quantity for any given substance

The index of refraction may be accurately expressed by a fraction whose numerator is the sine of the angle which a ray in a vacuum makes with a line perpendicular to the surface of the denser surface, such as water or a lens, and whose denominator is the sine of the angle which the ray makes with the same perpendicular inside the denser substance The fraction may be expressed as follows

$$\frac{\text{Sine angle of incidence}}{\text{Sine angle of refraction}} = \textit{Index of refraction}$$

When a ray of light passes through a liquid at an angle which is nearly parallel with the surface, the ray cannot emerge into the air, for the refraction turns it back into the liquid, and thus the ray is totally reflected A refracting prism is used in place of a mirror when the most perfect reflection is desired

The refractometer is an instrument used to determine the index of refraction of a substance, which, in a clinical laboratory, is usually a solution The substance dissolved in a liquid increases the index of refraction of the liquid in proportion to the amount of the substance in solution The index of refraction of pure water is about 1 3 When a substance, such as cane sugar, is dissolved in the water, its index of refraction is increased just as its specific gravity is increased, and so its refractive index is an indication of the amount of a substance dissolved in the liquid

The refractometer, like a microscope, may be extremely simple in plan and construction, or it may be complicated A common type, the "Abbe," is about the size and appearance of an ordinary compound microscope A thin layer of the solution to be examined is placed under a prism which may be rotated with accuracy The prism is viewed with an eyepiece, and is rotated until the dark area of total reflection of light covers exactly one-half of the field of view. The angle of rotation of the prism is then read on a scale by means of a magnifier, but the scale is usually made to give a direct reading of the index of refraction

The index of refraction varies with the temperature, being increased as the temperature is lowered The temperature of 17 5C is the standard temperature at which a reading is usually taken Some instruments are made with devices for maintaining a constant temperature

The most common use of the refractometer is probably that in sugar making, where the percentage of sugar in the plant juice must be determined with accuracy from the time of the purchase of the cane or beets, until the sugar is finally crystallized from the solution

Much research work has been done in order to determine the relation of the index of refraction of biological solutions to various conditions of the body The following table shows the scope of the investigations in which an extensive literature has already been developed

1 Investigation of serum
   (a) Determination of its albumen content
   (b) Determination of the ratio of albumen and globulin
   (c) Determination of the fibrinogen
   (d) Determination of the quantity of blood in a person's body
2 *Determination of the hemoglobin*
3 The Abderhalden reaction
4 Investigation of the cerebro-spinal liquid
5 Investigation of gastric juice
6 *Investigation of urine*

While physicians generally will not often have occasion to ask for refraction tests, yet they should know that the refractometer is one of the instruments of precision that are at their disposal

BOOK REVIEWS

THE PNEUMOTHORAX AND SURGICAL TREATMENT OF PULMONARY TUBERCULOSIS By CLIVE RIVIERE M.D Second Edition. 12mo of 311 pages London and New York, Oxford University Press, 1927 Cloth, $3.25 (Oxford Medical Publications)

The second edition of Dr Riviere's book is most complete for a book of its size

He describes, in a very concise and thorough manner the mode of action of artificial pneumothorax, its indications and contra-indications the pneumothorax apparatus, and the technique of initial operation, together with all the facts relating to the treatment of tuberculosis by the production of artificial pneumothorax

In his discussion of artificial pneumothorax, he sets forth very clearly the various effects produced, and the treatment of all conditions arising in this mode of treatment.

In part two the book is devoted to the surgical treatment of pulmonary tuberculosis and embraces a historical survey, the mode of action of thoracoplasty and other surgical methods, indications and contra-indications, various operations in present use, choice of anaesthesia preparation for operation and after treatment, and final results of surgical treatment

R. F H

FOOD INFECTIONS AND FOOD INTOXICATIONS By SAMUEL REED DAMON, A.M., Ph.D Octavo of 266 pages, illustrated Baltimore, The Williams & Wilkins Company, 1928 Cloth, $4 00

The author has divided his book into three main parts in which food infections, food intoxications, and zooparasitic infections acquired through food, are respectively discussed. Under food infections, chapters are devoted to the paratyphoid group, tuberculosis from milk and meat, undulant fever, septic sore throat, and actinomycosis The bacteriology, pathology, diagnosis differential diagnosis, and treatment of each of these types of food infection receive clear and adequate discussion.

Food intoxications are grouped in the second division of the book. The chapter on botulism is excellent. Considerable space is devoted to the various types of mushroom poisoning Other food intoxications described are ergotism, lathyrism, milk sickness potato, fish, and shellfish poisoning The chemistry, pharmacology, diagnosis and treatment of these intoxications are given in detail

The third part deals with zoo-parasitic food infections The chapters on trichinosis and taeniasis are quite complete, a large number of other parasites are somewhat more briefly described. A plate of the more common ova, and a key for their identification, is a very useful addition.

The book is well illustrated and a good bibliography given at the end of every chapter It should be a valuable reference book for the laboratory and for those interested in public health, as well as for the practitioner of medicine.

ARNOLD H. EGGERTH

A COMPEND OF PHARMACY By F E. STEWART, Ph M., M D Tenth Edition, revised. 12mo of 199 pages Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $2 00

In this revision this excellent compend, now in its tenth edition, maintains its place of prominence among books of its kind

In a concise form it gives the essentials of pharmaceutical operations, the various preparations of the U S P X. and National Formulary, and the preparations of the inorganic and organic materia medica

F S

INTRODUCTION TO THE HISTORY OF SCIENCE. Volume I From Homer to Omar Khayyam. By GEORGE SARTON Quarto of 839 pages Baltimore, The Williams & Wilkins Company, 1927 Cloth, $10 00

This is a volume only for and of the greatest importance to scientists and students of history However, anyone pretending to an educational culture will find it interesting and very much worth while. It is the first volume of a series This volume covers that period of history from Homer to Omar Khayyam. It is comprised of 34 chapters and an Index. Each chapter is devoted to a single period. There is an ample Introductory Chapter which is solid reading and will interest scientist and layman alike. Each following chapter is divided into two parts The first part covers a period of time, (the first chapter to a period of indeterminate length, the next three to centuries, and the remaining, 30 in number, to periods of half a century each), and is really a summary of the main facts The remainder of the chapter is an outline of material for study and reference.

In the Introductory Chapter we read, "The purpose of this work is to explain briefly the development of one essential phase of human civilization the development of science, that is of *systematized positive knowledge*. The acquisition and systematization of positive knowledge is the only human activity which is truly cumulative and progressive."

This is an important work and should be in the library of every scientist and historian

T S W

CLINICAL ASPECTS OF THE ELECTROCARDIOGRAM A Manual for Physicians and Students By HAROLD E B PARDEE, M D Second Edition, revised. Octavo of 242 pages, with 60 illustrations New York, Paul B Hoeber, Inc., 1928 Cloth, $5 50

In this second edition of his work on the electrocardiogram, Dr Pardee has added much to an already valuable book. In Chapter III on hypertrophy of the chambers of the heart, the older terminology of left or right ventricular preponderance has been replaced by right or left axis deviation and a very clear exposition of the whole subect ensues The fact that considerable axis deviation may exist due simply to altered anatomical position of the heart in the thorax and not dependent upon any disease process is clearly shown. The concept of axis deviation will be helpful to all students of electrocardiography

Perhaps the most helpful addition to the book however is the chapter on the description and operation of the electrocardiograph. The reviewer can well remember his difficulties when he became interested in electrocardiography in finding anything in the literature upon the construction of the instrument the principles of physics involved and the technique of taking the electrocardiogram All this is supplied in Dr Pardee's book in very clear and helpful form including suggestions for locating trouble in the instrument when this occurs This chapter is extremely valuable and makes one wish to own the second as well as the first edition.

E. P MAYNARD JR.

A TREATISE ON DISEASES OF THE HAIR AND SCALP By S DANA HUBBARD, M.D Octavo of 500 pages, illustrated. Philadelphia, Lea and Febiger 1928 Cloth $5.50

In this book the author covers many subjects which are not usually found in the ordinary books on dermatology As the book is limited to the hair and scalp and face the author has a limited amount of the body to cover which he does very well He gives very many

On the sixteenth of September
In the year nineteen twenty-eight
God started riding early
And he rode till very late

He rode out on the ocean,
Chained the lightning to his wheel,
Stepped on the land at West Palm Beach
And the wicked hearts did yield

Chorus —
In the storm, oh in the storm,
Lord, somebody got drowned,
Got drowned, Lord,
In the storm

"The song follows faithfully the form and thought of all the spirituals God, who sends desolation to humankind, but always for a moral purpose and is the hero of the story, God, to whom all praise for whatever fragment of life or property He may choose to leave for those who sing His righteousness and glory"

STORY OF CHRISTMAS SEALS

Doctors know about Christmas Seals, but few know how they came to be The *New York Times* tells their story on its editorial page of November 24, in the following words

"The magazine *Baltimore* has done well to recall the story of the Christmas seals and how they came to be used in this country

'A Danish postal clerk in Copenhagen named Elinar Holboell conceived the idea of the stamp for the purpose of helping raise money for a children's hospital A letter bearing one of these stamps came into the hands of the late Mr Jacob Riis in this country, who was at the time interested in the Sea Breeze Hospital

"Mr Riis wrote an article about it that was published in *The Outlook* The idea was taken up by others, including a Miss Bissell in Delaware, who by its use raised $3,000 for a tuberculosis pavilion in that State In 1908, thanks largely to the impetus originally given by Mr Riis and the efforts of Miss Bissell and others, the American Red Cross began a nation-wide sale of tuberculosis Christmas seals In 1910 the National Tuberculosis Association joined with the Red Cross in the Christmas seal sale This partnership lasted till 1920 Since then the National Tuberculosis Association has been the principal mover in the sales This year the American Society for the Control of Cancer has issued special Christmas stamps of its own in order to help raise funds to fight cancer"

GOOD FOR A COLD

A cold is the oldest of diseases It is the form of sickness with which everybody is the most familiar, and yet it is the one about which doctors know the least It is not strange that home remedies are numerous and are most contradictory in their nature James J Montague in his department "More Truth Than Poetry" in the *Herald Tribune* of December 14, discusses some of the sure cures in the following verses

"You never ought to let a cold
Embrace you with a strangle hold,
Which may bring fevers, aches and chills
And even more appalling ills
Be warned when you begin to sneeze,
The remedies for colds are these
Immediately to bed repair,
For colds thrive on chilly air
Stay out of doors the whole day through,
For that will still the worst 'kerchoo'
Tuck three big meals in every day
And they will drive the cold away

No cold, however bad, can last,
If for a fortnight you will fast
If you keep muffled to the neck,
You'll hold the direst cold in check
No cold can get so very bad
If you go always thinly clad
Take lots of quinine every night
And soon the cold will be all right
No medicine that's ever sold
Will cure, or even help, a cold
No cure in all this list I've shirked
And none of them has ever worked'

THE GLANDS REGULATING PERSONALITY A Study of The Glands of Internal Secretion in Relation to the Types of Human Nature. By LOUIS BERMAN, M D Second Edition, revised Octavo of 341 pages New York, The Macmillan Company, 1928 Cloth, $3 50

After "exploring and sifting" some twenty thousand articles and several hundred books, Dr Berman has come to write a volume on the importance of our internal secretory glands to human behavior This book is now revised and in its second edition

The author, rather gallantly, reviews the lives of some of the contributors to endocrinology Exactly twenty-one glands and organs of internal secretion are described and their products named, as if the final word had been said about each one. Then follows a discussion of interrelation of these glandular hormones, their effect on personality and character formation. Dr Berman even goes so far as to state that by knowing one's history "his physical appearance may be described and his future outlined"

Sex life, menstruation and gestation are then described and the value of endocrine effects on them elaborated The role of the glands on the mind is made a subject of rather lengthy oratory The Freudian conception of the subconscious is not recognized because it does not include internal secretions A concise classification of glandular types is then presented with Napoleon, Nietzsche, Darwin and Wilde as examples

A very small part of the contents of this book is scientific, a good fraction is problematic, but its major bulk is melodramatic.

JOSEPH S BENDETSON

A TEXT BOOK OF GENERAL BACTERIOLOGY By EDWIN O JORDAN, Ph D Ninth Edition, revised Octavo of 778 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, $6 00

The ninth edition of this standard text-book, brought up-to-date, contains the latest work on every phase of this science, especially on Scarlet Fever, Erysipelas, Rheumatic Fever, Tularemia, the bacteriophage, etc

The work is comprehensive, clear and readable. It takes up not only all the organisms pathogenic for man, but also the bacteriology of plants and of industry, detailed examination of soil, water, air, milk and milk products

I COHN

URINARY ANALYSIS AND DIAGNOSIS BY MICROSCOPICAL AND CHEMICAL EXAMINATION By LOUISE HEITZMANN, M.D Fifth revised Edition Octavo of 366 pages, illustrated New York, William Wood and Company, 1928. Cloth, $5 00

The analysis of the urine is a routine in the clinical study of all cases A carefully prepared manual on such a common subject of importance cannot fail to find a large field of receptivity Dr Heitzmann has admirably come up to that criterion, and we are happy to recommend this book for the daily use of anyone engaged in urine examinations

The care which the author has devoted to the study of epithelial cells in the urinary tract is worthy of much notice. It is quite a well known fact that many patients are cystoscoped in an endeavor to localize the lesion in the urinary tract. The author says that this is quite unnecessary as a study of the epithelial cells will show whether the lesion is localized or generalized. There is probably much skepticism on this point, but more attention can well be paid to the ideas of the author than is probably done at present. There is practically nothing taught about this in the medical schools today

The statement that presence of sugar in the urine means diabetes mellitus needs modification The remark that a blood sugar determination should be made on all patients showing sugar in the urine is more to the point, as only by that method can a true failure of carbohydrate metabolism be determined

The illustrations are not very clear in the delineation of cells When this part of the work from the author's viewpoint is so important, it does not seem amiss to urge that in subsequent editions that more care be devoted to this part of the work

J ARTHUR BUCHANAN

THE HEALERS By B LIBER. 12mo of 455 pages New York City, Rational Living, 1928 Cloth, $3 00

"The Healers," by B Liber, is a book written to all intents and purposes to review and deride all the healing cults of the past and present including medicine. The author does state that of all these evils, medicine is the least evil

The story, to our mind, is incidental It is the history of a boy ordained by his mother and destiny to become a doctor We follow the boy, William straight from his childhood through his premedical schools days, his medical course and then into his practice or rather his attempts to establish a practice. We see his disappointments and disillusions in the medical world, his inability to commercialize his inadequate knowledge and finally his desertion of the medical profession.

The author points out all the fallacies of the healing cults and destroys all of them without offering any substitute. He even adds confusion by raising doubts against some of the old established facts of medicine, such as vaccination and diphtheria antitoxin He makes no attempt to show us the heroic aspects of medicine.

WILLIAM RACHLIN

PRACTICAL CLINICAL PSYCHIATRY FOR STUDENTS AND PRACTITIONERS. By EDWARD A. STRECKER, A.M., M D, and FRANKLIN G EBAUGH, A.B, M.D Second Edition revised Octavo of 458 pages Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $400

There are too few excellent treatises on Psychiatry, considering the importance of this branch of medicine. And many of those issued in recent years are hardly available to the general practitioner, because of the fact that they have been written from the viewpoint of some one school of psychological research

But this volume of Strecker and Ebaugh is one of the best books on Psychiatry for the family physician which has been issued in recent years Showing a breadth of scholarship, and quite evidently the product of men of wide experience, it avoids the use of a style too common to many neurological and psychiatric writers, which cloaks rather than clarifies much of what they intend to say

Their management of the subject is more descriptive than analytical. The case method is followed throughout. But each mental syndrome is fully described I can most heartily recommend this book to the man who would like to have a good psychiatric book in his library For the general practitioner, it has another advantage, in that the discussions are brief and to the point. As psychiatrists we know that because of the nature of our work, most of our descriptions and analyses have to be somewhat sustained Yet these authors furnish all the necessary facts to enable one to understand each disorder, without encroaching too much on the reader's time.

Though there have been other books on Psychiatry, stressing the case-history approach to the subject—Kraepelin's for example—we know of no small book following this method which is as good as this one The only criticism one might make is that the authors, while not out of sympathy with Psychoanalysis, have utilized too little the psychoanalytic literature. But we must recognize that they are dealing with Psychiatry and not with Psychoanalysis And because of the high regard which we have for them as leading American psychiatrists, what they say bears the stamp of authenticity

JOHN F W MEAGHER

interesting insights into the different branches of medicine which have developed in recent years as a result of the changes in the styles and desires of the female sex which has lead to the development of the so-called beauty shop The book is well illustrated throughout, many of the cases so represented being from the author's own clinical service or practice. In his treatment the author devotes a great deal of space in many of the diseases discussed and especially in those conditions which are most commonly seen, such as ringworms, superfluous hair, eczema of the scalp and dandruff He takes particular pains to write out many of his treatments in prescription form and closes his book with a very complete appendix containing many useful prescriptions and suggestions There are however several small errors to which the author's attention should be called On pages 352 and 353 the word erythematosus is misspelled beneath the illustrations On page 326 the author uses the term "tinea sycosis" synonomously with the term "staphylococcus aureus and albus" On page 50 under the title of "Number of Hairs" he quotes "according to Withof one square inch of scalp has 5072 black hairs, 608 brown hairs and 790 fair hairs" From these figures the author deduces that a flaxen haired beauty has from 140,000 to 150,000 hairs on her head and a black haired girl has from 100,000 to 110,000 hairs on her head It appears as though the opposite would be true.

G F Price.

Gynecology for Nurses By Harry Sturgeon Crossen, M D Octavo of 281 pages, illustrated. St. Louis, The C. V Mosby Company, 1927 Cloth, $2 75

This little volume, two hundred and eighty-one pages, with three hundred and sixty-five engravings, comes from the pen of H S Crossen This statement insures to all gynecologists a high standard of authorship No greater compliment can be paid the work than to say that it is a fitting supplement to the two internationally known works of the author Diseases of Women and Operative Gynecology Like its predecessors it is freely and beautifully illustrated.

The work is divided into two parts Part one dealing with gynecologic anatomy, physiology, examination and treatment. This section is clearly and ably presented in a manner suitable for the medical student and nurse. It is short but complete, there being an excellent paragraph on radium in gynecology Part two, Details of Gynecologic Nursing is new in its text and arrangement. It should be of great value to instructors in nursing as well as the student nurse. The chapter on operative technic seems to the writer to be out of place in a book for nurses and the excellent illustrations of gynecologic operative technic could have been omitted to advantage Surely we should make no effort to produce operative technicians amongst our nurses

As a whole the book is of great value not only to student nurses but to those to whom their training is entrusted It presents clearly but briefly the salient points in gynecological anatomy, physiology and examination It covers in detail the duties of gynecologic nursing including operating room and operative technic. Coming from H S Crossen the standard and quality of illustrations is assured

Onslow A. Gordon, Jr

Filterable Viruses By Harold L. Amoss, and others Edited by Thomas M Rivers Octavo of 428 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1928 Cloth, $7.50

In this work are presented in a systematic manner some of the chief problems encountered in the field of filterable viruses. The different diseased conditions seen in the animal and plant life which are considered to be due to filterable viruses are discussed by ten different authors each of them a well recognized authority on the subject.

The epidemiological aspect, immunity, prevention, effects of viruses on cells, and their resistance to physical and chemical agents are fully discussed.

The subject matter is up to date and reflects the state of affairs as it now exists in the field of filterable viruses

The text contains a number of illustrations, plates, and a detailed bibliography follows each chapter

E. H Nidish.

Aluminum Compounds in Food Including a Digest of the Report of the Referee Board of Scientific Experts on the Influence of Aluminum Compounds on the Nutrition and Health of Man By Ernest Ellsworth Smith, Ph D M D Octavo of 378 pages New York, Paul B Hoeber, Inc., 1928 Cloth, $7 00

This is a comprehensive résumé of the work done by the author and others interested in the same field, that of aluminum compounds in food as related to the animal economy Most of the work grew out of the dispute as *to the deleterious action of alum baking powders* As always, such work leads to an enormous accumulation of interesting and important data often only remotely related to the original question. Thus the properties of aluminum in relation to the individual cell and the higher organisms have been studied with the care and patience that are lacking in our knowledge of other elements

The author states his own beliefs with great clarity and time with its harvest of more facts seems to bear out his early ideas on the subject. It is an admirable book for those interested in the newer work on nutrition with special reference to the effect of small quantities of elements or compounds on the health of a living organism The subject matter as presented here falls into three groups The occurrence of aluminum in the food, the action of this element on isolated cells and tissues, and the effect on growth and well-being of the animal organism

A. Goerner.

The Principles and Practice of Obstetrics By Joseph B De Lee, A.M., M D., Fifth Edition, revised. Octavo of 1140 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, $12 00

The worth and integrity of Dr. Lee's work are such that little need be said in this review of the fifth edition, save to point out that every new advance has been incorporated and its value assayed. New illustrations add to the value of the book in a material manner, while its full bibliography completes its value for the research worker

G W P

Epilepsy Comparative Pathogenesis, Symptoms Treatment By L. J J Muskens, M D., Octavo of 435 pages, illustrated. New York, William Wood & Company, 1928 Cloth, $8 00

There are but a few medical subjects that are as baffling as is epilepsy The general medical practitioner as well as the specialist in the different branches of medicine frequently meets the epileptic and is confronted with a malady that is puzzling from an etiological as well as from a therapeutic aspect. It is therefore with a sense of relief that one comes across a book written by one who has studied the subject from an anatomical, pathological and clinical aspect. A great portion of the book is devoted to experimental data. The various types of epilepsy are thoroughly discussed, and the different theories of their mechanisms are critically evaluated There is an introduction by Sherrington, which adds considerably to the authenticity of the work. It is a valuable book, and one that should appeal to every physician It is an indispensable work for the neurologist

Irving J Sands

For Complemental Feeding

Prescribe **DRYCO** ***The Safe Milk***

MANY Pediatrists advocate regular complemental feedings for the breast fed infant. They find that this relieves the strain upon the mother, prolongs the nursing period and has an excellent effect upon the weight and general nutritional condition of the child. Such a procedure also minimizes the difficulties attendant upon eventual weaning.

Dryco is ideal for use in conjunction with breast milk The special drying process renders the formation of thick, tenacious curds impossible, eliminating digestive and nutritional disurbances Free from pathogenic bacteria, the use of Dryco avoids milk-borne infections

OUR NEIGHBORS

THE SHEPPARD-TOWNER ACT IN OHIO

The November issue of the Ohio State Medical Journal contains a two-page comment on the Sheppard-Towner Act which gives Federal Aid to States doing child welfare work approved by the Childrens' Bureau of Washington, D C New York State has received funds under the Act, and the State Department of Health has thereby been enabled to undertake demonstration activities, some of which have been carried on by County Medical Societies Ohio has also accepted Federal funds and has carried on an extensive series of child health activities However, opposition to the acceptance of Federal aid is widespread as is shown by the following abstracts from the Ohio State Journal

"There is much propaganda and many indications of renewed activity on the part of those who will request the next session of Congress to make an additional appropriation for the extension of the Sheppard-Towner Act Under the present Federal appropriation, the operation of this law will expire on June 30, 1929

"Many official documents have been issued by the Childrens' Bureau of the United States Department of Labor which either directly or by implication take credit under the Sheppard-Towner Act for the decreased infant mortality rate As commented upon and analyzed from various angles in previous issues of this Journal, there are many economic and social factors contributing to the decrease in infant mortality, and even if some of the official maternity and infancy activities are helpful, especially from an educational standpoint, they could be handled much more economically and perhaps much more effectively through local and state health administration rather than through detached and costly administration from Washington

"The latest publication of the Childrens' Bureau, known as Publication No 186 and comprising a booklet of 150 pages, recently off the press, sets forth in detail work under the maternity and infancy act in the various states for the fiscal year ending June 30th, 1927 and with a general review since the Sheppard-Towner Act was passed by Congress, and approved on November 23, 1921"

Ohio expended from $10,000 00 to $25,000 00 annually out of a possible maximum of $48,000 00 allottment The article continues

"In commenting on the renewed activities for further extension of the provisions of the Sheppard-Towner Act, the October *Bulletin of the Toledo Academy of Medicine* says in part

"'Two easy methods of defeating such inroads of medicine are in the hands of every practitioner First, he can explain to his many patients, in just a few words, that the Sheppard-Towner, or "maternity and infancy" act, is just a large piece of masked socialism He can show that this legislation will keep the Federal government forever in the business of paying money to the states for local medical and nursing work He can truthfully state that the money has been used for many purposes other than those intended in the act, that bureaucracy, ever exalting itself, will make additions ad infinitum until it covers the general field of medicine, until the governmental subsidy will require additional tax burdens on the citizen Second, he can write, wire and personally visit his Congressmen and prevail upon them to kill the Sheppard-Towner and such socialistic acts for all time'

"Too frequently the attitude of the medical profession is misunderstood on legislation and administration of the character of the Sheppard-Towner Act The medical profession always has advocated and supported constructive and practical legislation on public health The profession is at present as consistently interested in the reduction of unnecessary maternal and infant mortality as ever before The objections to governmental activities such as the Sheppard-Towner Act are based on the sound policy of opposition of Federal centralization, impersonal and detached supervision, unnecessary expenses, duplication of activities which should be strictly local or within the supervision of each state, the general and widely varying activities possible under such an appropriation, coupled with the possible development from 'education' to actual 'care and treatment' In Publication No 186 (above referred to), the section devoted to Ohio is of sufficient interest to warrant reproduction as follows * * * "

The article then gives a lengthy quotation from the bulletin, giving statistics regarding the lectures, clinics, demonstrations and other activities carried on The impression given is that an immense amount of useful work has been done However, the report closes with comparisons of mortality and morbidity rates in two sets of counties, one with the Federal assistance and another without, and the differences are not large enough to convince the

(Continued on page 57—adv rv)

(Continued from page 54)

physicians of Ohio of the superlative value of the Sheppard-Towner assistance.

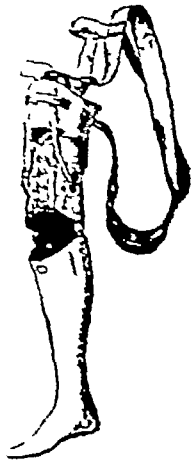
The impression of a disinterested observer is that the statistical method of judgment may be one sided and unfair The educational work that has been done in both New York and Ohio is of very great value, even if sick rates continue high. It is probable that a small group of children not reached by any means furnish the greater proportion of cases of sickness and death

PUBLIC HEALTH AND THE DOCTOR IN TEXAS

The November issue of the *Texas State Journal of Medicine* has the following editorial remarks on the practice of public health by physicians.—EDITOR'S NOTE.

If the medical profession will not interest itself in practical public health, and recognize public health as a specialty in medicine, it may find itself eventually in a serious predicament, in fact, several serious predicaments The doctor has been the leader in public health thought for many generations Changing conditions of civilization have tended to divorce him from this service, which has never been a remunerative one and which has always been a traditional obligation on the profession

It is up to the medical profession to make its leadership felt in public health matters, whether or not it is going to specialize very extensively in that work There are boards and committees and groups of varying make-up and designation, all over the state, having to do with public health. Some of them are doing some very familiar things, and all of them likely will be doing it if we don't have a care Few of these groups will refuse to listen to the doctor Indeed, the doctor will be welcomed into their organization Generally, the trouble is that he will not bother about it That is where he makes his mistake



Someone who knows what it's all about must serve in preparing the way for the prevention of disease That someone should, beyond any doubt, be the doctor

Leadership should remain in the hands of the medically educated worker We cannot blame the lay worker in public health for assuming the responsibility of and becoming active in leadership when opportunity offers The blame must rest with those who permit it, and, as a rule, these do not themselves know the fundamental principles involved It is up to the medical profession to see that they are informed

If our people are familiar with the story of scientific medicine, both preventive and curative, they will be quick to appreciate the necessity of

KNOX SPARKLING GELATINE adds appetite value to many special diets

It is particularly useful in anemic cases

MEDICAL practice, in the treatment of pernicious and certain other forms of anemia, has shown marked progress in the last few years In this development, the matter of diet has received major consideration. Clinical tests have demonstrated that the feeding of liver and other vitaminous foods is highly successful

The unbroken liver diet presents a problem to the doctor, particularly where patients rebel against its monotony Here Knox Sparkling Gelatine is a valuable adjuvant, not only with liver but with other foods It permits the introduction of a variety of pleasing dishes which stimulate the patient's appetite and give the necessary nourishment

As a vehicle for more concentrated foods, Knox Sparkling Gelatine finds many other dietary uses Pediatrists recommend its use with milk when infants have curdy stools, diarrhea, constipation, colic, or excessive gas formation Its colloidal ability reduces the formation of large curds, and so helps overcome regurgitation and vomiting In the diabetic diet, Knox Sparkling Gelatine adds bulk, and imparts satiety to the patient, as well as making the food more eye-attracting and palatable In the liquid and soft diet of convalescents and invalids, delicious, appetizing dishes prepared

QUALITY WITH ECONOMY

Knox Sparkling Gelatine is the highest quality for health It is a protein in its purest form, particularly suitable where carbohydrates and acids must be avoided When you purchase Knox Gelatine you not only get quality but economy, for each package makes four different desserts or salads of 6 generous servings each

with gelatine intrigue mincing appetites

Knox Sparkling Gelatine is the only product of a concern with 41 years of experience in manufacturing the highest quality gelatine It is a pure protein, unbleached, unflavored, free from sugar

Valuable booklets available

The list of authoritative booklets included at the bottom contains much additional data on the medical value of Knox Sparkling Gelatine, and suggests a number of recipes for the various prescribed diets They are available to surgeons, doctors, dieticians, and members of hospital staffs Check those that interest you and mail us the coupon

2 Regulation relating to the sanitation of public eating and drinking establishments

3 The establishment of a tuberculosis bureau or division in the Department of Health under which economical and efficient co-ordination of all tuberculosis control work in the city may be effected

4 Provisions of more hospital beds for the tubercular especially for hospital cases and proper recommendations for tubercular children for whom no provision is made at the present time

It is most interesting to note that of the 115 members of the fifteen committees of the Health Council engaged in the appraisal, seventy-four are doctors, and two doctors on each committee or thirty in all were official representatives of the Medical Society of the City and County of Denver

The combination of prominent members of the County Medical Society, officials of the City Health Department and earnest and experienced leaders of private organizations working in close and cordial relationship on a revision of public health methods ought to effect changes for far-reaching importance

The mayor and city council may be relied upon to appreciate the importance of the appraisal and to act upon its recommendation

RABIES IN NEW ORLEANS

The threat of human rabies is far more widespread than even doctors are aware, and there is a large group of persons who deny the existence of the disease in dogs as well as in men Parts of Westchester County, New York, are under the certification of the State Commissioner of Health that dog rabies is prevalent and constitutes a human menace, and there have recently been human deaths from rabies But it takes several human sacrifices to the god of American independence, or liberty, or license, or other fetish, in order to awaken the people to take precautions for their very lives

New Orleans, too, is threatened with human rabies A child died of human rabies in the early fall after receiving treatment for dog bite in a hospital of New Orleans, and this death was made the occasion for free advertising of two chiropractors who sponsored a "kindness to animal week" in protest against a campaign of dog catching Further, a prominent newspaper supported the chiropractors and ignored the protests of the Orleans Parish Medical Society

These facts are set forth in a letter in the *New Orleans Medical and Surgical Journal* of December Commenting on the letter, the *Journal* says editorially

placing both curative and preventive medicine in the hands of thoroughly educated doctors And when they come to that point of view, adequate salaries will be paid for adequate service Then, indeed, will public health come into its own as an organized specialty in medicine. However, the public will never understand these things until we go to them with the story There are ways and ways of doing this Dr Prothro is approaching the people mainly through the public schools Here and there efforts are made through disjointed public health lectures, to bring about a realization of scientific medicine in the prevention of disease as well as its cure These lectures are delivered on a catch as catch can basis to luncheon clubs, meetings organized for other purposes, and the radio These are all good as far as they go, but they do not go far enough There should be a supervising, coordinating agency for public health education, with ample means and talent at its command Such an agency has been provided for through the State Health Department It is expected that there will arise in the process of the reorganization of the department, a bureau or division devoted to the education of the public on health matters If this bureau is organized and given ample funds and the undivided support of the medical profession, and other health workers throughout the state, the problem will be well on its way to a happy solution In the meantime, the pitfalls in the way should be borne in mind, and some of them are pointed out in the health articles in this number of the JOURNAL

HEALTH APPRAISAL OF DENVER

[The November issue of *Colorado Medicine* contains the following editorial comment on an appraisal of the health needs of the City of Denver, conducted by a Public Health Council that was largly dominated by physicians—EDITOR'S NOTE

The idea of a thorough analysis of all health activities in the city and county from which could naturally follow economy through elimination of duplicated activities and greater efficiency through logical revisions of method and through better co-ordination between municipal official management and voluntary enterprise first took shape in 1925 but was temporarily shelved until revival this year by the Health Committee of the Community Chest and finally carried out under the auspices of the Public Health Council

Among the more important recommendations of the preliminary report are

1 Construction of a new contagious disease hospital

(*Continued on page 59—adv xvii*)

QUICK SERVICE PRESS

242 E BROADWAY
NEW YORK CITY

BRONCHIAL ASTHMA

Can be definitely relieved with

Iodogrin

CLINICAL tests have demonstrated its therapeutic efficacy and proved further that its continued use entails no bad effects on the patient

Literature, and a liberal clinical sample will be furnished the physician upon request

EACH FLUID OUNCE REPRESENTS
Iodides 48 grains
Euphorbia Pilulifera, 6 grains
Grindelia Robusta, 48 grains
Combined with aromatics

Prepared expressly for physicians use by

THE BUNDT LABORATORIES
DETROIT, MICHIGAN

PHILLIPS Milk of Magnesia

THE IDEAL
LAXATIVE-ANTACID

The name "PHILLIPS" identifies Genuine Milk of Magnesia It should be remembered because it symbolizes unvarying excellence and uniformity in quality

Supplied in 4 oz., 12 oz., and 3 pt Bottles

THE CHAS. H. PHILLIPS CHEMICAL CO.
New York and London

The Cod Fish Region

DOTTED along the shore line from Cape Cod up to Labrador are the Patch plants, where the fishermen bring in their daily catch of cod fish, and the oil is obtained by promptly cooking the fresh livers

Because of the far-flung range of these plants and the steam trawlers following the fish into deep water, Patch's Flavored Cod Liver Oil is made when and where the fishing season is right

Your assurance of therapeutic potency is the vitamin guarantee for both A and D which appears on each bottle of Patch's Flavored Cod Liver Oil Each lot is biologically tested, to insure your patients a dependable product.

There is a distinctive flavor to

Patch's Flavored Cod Liver Oil

and the proof of the flavor is in the tasting, so we want you to taste it Let us send you a bottle, just to give you an agreeable surprise

THE E. L. PATCH CO.

BOSTON, MASS.

The E. L. PATCH CO,
Stoneham 80, Dept. NY-I
Boston, Mass.

Please send me a sample of Patch's Flavored Cod Liver Oil and literature.

"In this connection it might be said that rabies is rife among the dogs of New Orleans It is the stray, unwatched animal that is potentially dangerous to children particularly, but to adults as well It is this animal that the chiropractor would protect As an example of unthinking interference we would say that recently in New Orleans considerable notoriety was attained by the action of an individual who objected physically and pugnaciously to the methods employed by the official dog catcher in collecting stray animals to be impounded If this man had ever seen a child die in the horrible agonies of hydrophobia never, we are sure, would he object to any measures to get rid of one of the most frightful of diseases bred in the curs of the alleys He would utter words of thanks that the authorities are attempting to control the source of the disease He, the general public and the press, would bless the name of Pasteur, the greatest of Frenchmen who made possible a treatment which will prevent, it is true in not every case, but in by far the great majority of cases, the development of one of the most agonizingly horrible and frightful diseases, rabies"

POPULAR MEDICAL EDUCATION IN ILLINOIS

The December issue of the *Illinois Medical Journal* contains the following summary of the November activities of the Educational Committee of the State Medical Society

"One hundred and seven speaking appointments were filled Twenty-six of these talks were given in Illinois High Schools in observance of Health Day of American Education Week The other appointments represent women's clubs, parent-teacher associations, men's clubs, factories and teachers' institutes

"Women physicians of the Chicago Medical Society have been secured to give talks on sex hygiene before the girls of the Juvenile Detention Home of Chicago The request for this service came to the Educational Committee from the Chicago Woman's Aid

"Sixteen radio talks have been given

"Twenty-three articles have been written and approved by the Committee

"Six hundred and sixty-six educational health articles were sent out to newspapers using the regular health column

"Nine special articles were sent to community newspapers in counties where there were epidemics

"One hundred and eighty-five items were sent out to newspapers about the Quincy Clin

THE USE OF RADIUM IN DISEASED TONSILS*

By J COLEMAN SCAL, M D, F A C S, NEW YORK, N Y

From the Oto-Laryngological Dept. Beth Israel Hospital

THE uniformly excellent results obtained in the treatment of inoperable diseased tonsils by radium seeds warrants my enthusiasm for this method

The greatest obstacle to the application of this method for the relief of diseased tonsils is the opposition of the family physician The point usually raised against it is the supposition that the action of the radium cannot be controlled after the insertion of the seeds, and that the radiation would affect all the structures adjacent to the tonsils This surmise has no foundation, as it has been proved definitely that lymphoid tissue is much more sensitive to radium than is skin, muscle, or connective tissue structures This accounts for the selective action on the tonsillar tissue without affecting the adjacent structures

In a certain few cases, however, a repetition of the radium implantation proved necessary, but this I attribute to either the radon seeds being non-potent (technician's error in the preparation of the seed) or to the seeds not being centrally implanted, thus resulting in the upper or lower poles of the tonsils not being in the zone affected by the radium The amount of radiation can be measured so accurately that a definite amount is assured This can be accomplished by eliminating the caustic beta and irritating alpha rays, thus permitting only the therapeutic gamma rays to act without causing any burns or destruction of tissue At the same time the applicators can implant the seeds with such exactness that there is an equal and complete distribution of radiation throughout the tonsil While the same results can be obtained with needles which contain the element, or glass or gold seeds containing radium emanation I am now using the platinum removable seeds about 4 mm long and about 1 mm wide, containing an average of 2 56 mc radium emanation Each of these seeds has a strong silk thread attached to one end so that after the seed has served its purpose it can be removed by pulling on the thread The screenage amounts to 0 33mm thickness of platinum, enough to eliminate practically 98 5 per cent of the caustic beta rays The seeds can be sterilized by boiling After implantation these seeds lose about 0 75 per cent of their activity each succeeding hour, so that after four weeks the activity has entirely ceased The initial main activity, however, is affected during the first week since the period of half decay of radon emanation is 3 85 days In all, the maximum dosage for each millicurie of radium emanation amounts to 133 millicurie hours

The method on implantation is simple Cocainization of the pharynx is seldom necessary and is used only where the gagging reflex is such as to prevent depression of the tongue The radon seed is placed in a radon seed implanter This implanter consists of three parts, a trocar which is needle pointed and fits into the lumen of a cannula, obtruding from the lumen just far enough to make entrance of the implanter into the tonsil easy The cannula has a shoulder about 1 cm from the distal end so as to prevent its penetrating too far into the tonsil After the trocar and cannula are in position in the tonsil the trocar is withdrawn and the third part of the implanter, the obturator, is introduced The obturator is a blunt plunger which drives the seed home into the small space previously prepared by the insertion of the trocar The entire instrument is now withdrawn, leaving the seed implanted in the tonsil about 1 cm from the point of entrance of the needle, with its thread still attached and protruding from the point of entry The thread is now cut off with a long scissors about 1 or 2 cm from the tonsil This length thread does not cause the patient the slightest inconvenience

The seed is removed on the fifth day by a forceps which grasps the end of the protruding thread By the use of this technique hospitalization is unnecessary, it is purely an office technique without any disability A few patients complained of soreness of the throat but upon examination no inflammatory reaction was evident With a little local treatment this symptom promptly disappeared

Where a seed is implanted superficially it may

To again quote from authority on ultraviolet therapy..

"THERE has been an extraordinary awakening of interest in the use of light in the treatment of disease, both on the part of the general public and the medical profession.

"An astounding variety and number of sources of 'artificial sunlight' have been evolved and are now available. At this stage the busy general practitioner find himself somewhat bewildered Somehow he appears to be shy about taking up the new form of treatment, and yet he knows that his patients have heard of its existence and are talking about it. Several good treatises on the subject of Ultra-Violet Radiation have been published, but the busy practitioner is left rather at a loss as to what type of apparatus he should purchase, and what exactly he is venturing in the care, cost and management of such apparatus

"The writer feels that for the man in general practice and for the busy medical officer of health the Quartz Mercury Vapour Lamp is the only practical proposition "

—J Bell Ferguson, M D., D P H., in his preface to "The Quartz Mercury Vapour Lamp "

There are logical reasons why many thousands of physicians and hospitals select the mercury vapor arc in quartz in preference to all other artificial sources of ultraviolet radiations The advantages realized with the *Uviarc* burner as used in all Victor Quartz Lamps, are important to every practice general or specialized. The scientific advances in ultraviolet therapy and its widespread adoption in the leading clinics in recent years are coincident with the availability of the mercury vapor arc in quartz

You will find some valuable pointers in our booklet ' A Few Facts Pertinent to the Consideration of Artificial Sources of Ultraviolet Radiations.' Write for your copy gratis.

FREE MEDICAL SERVICE BY THE ANACONDA COPPER COMPANY

Dr George T Palmer, of Springfield, Illinois, in a letter in the November issue of the *Illinois Medical Journal,* discusses free medical services given by industrial establishments and says

"During the past summer I visited Poland for the purpose of looking over the general public health problems and especially the tuberculosis problem of the enormous Anaconda Copper Company interests The company is responsible for the material welfare of about 125,000 people

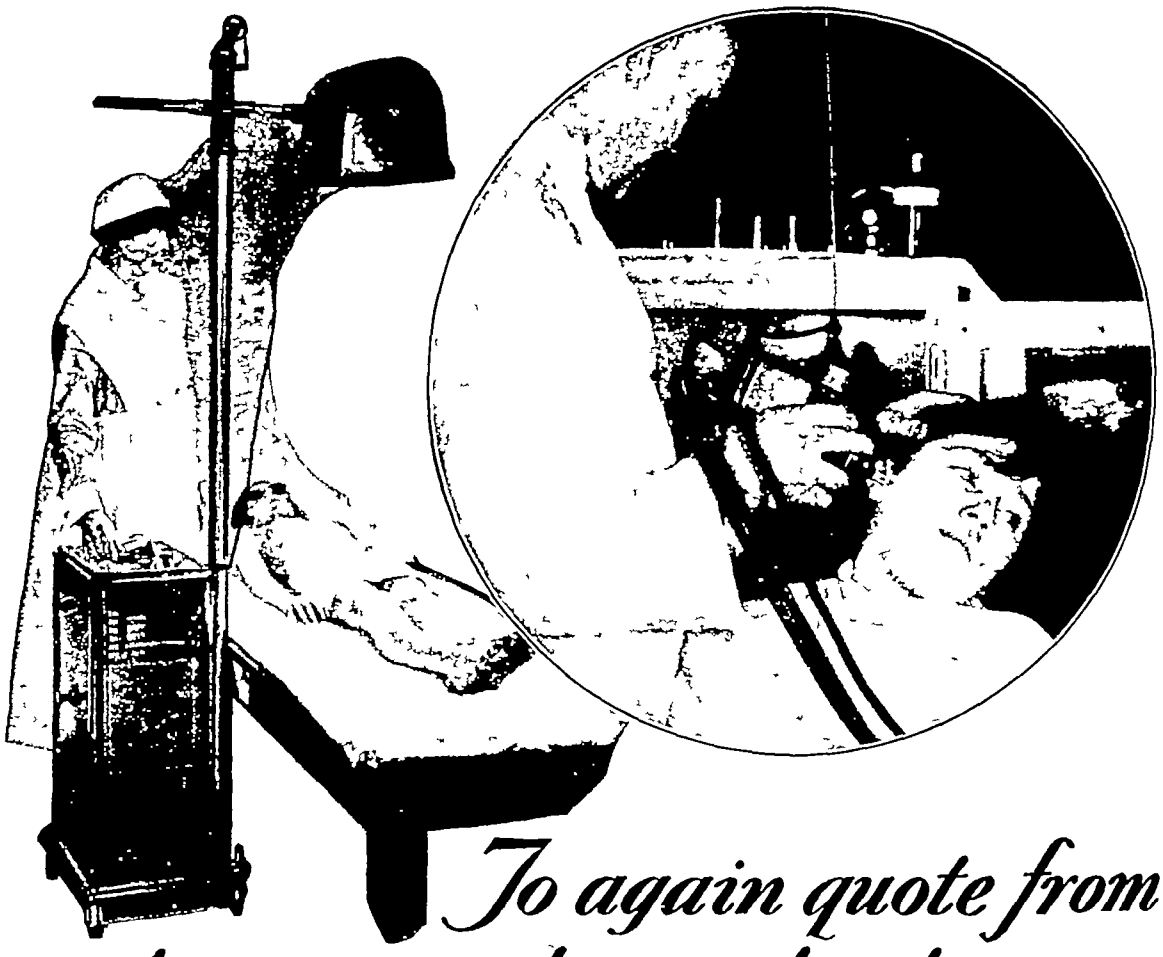
"As you of course know, Poland is entirely organized under a system of health insurance with most of the physicians employed with meager salaries in life time jobs The result is, of course, the smothering of all medical initiative and the situation is deplorable

"The very interesting feature of the situation is that the control of all medical affairs by general and local government, and by the government controlled insurance companies, results in the stamping out of all volunteer health activities and seriously impedes the ordinary measures which would be taken by a large corporation for the protection and care of their employes There are practically no private physicians

"It has occurred to me that a brief article on this situation might be timely for the *Illinois Medical Journal* and I should be very glad to prepare it if you care to have me do so I think that you are convinced that volunteer health organizations are contributing to the tendency toward state medicine It is interesting to find in Poland that state medicine, when it is finally obtained, absolutely abolishes and strangles out these very volunteer health organizations

"I believe it is an angle which has not been given emphasis or publicity"

Poland Water



because of its purity and bland diuretic properties is always a desirable adjunct in the sick room.

Our records prove that Poland Water will often be taken freely when ordinary water is refused

Today is a credit age and physicians cannot avoid credit losses unless they avail themselves of the service of a reliable Credit Rating and Adjustment Company Such a service is worth many thousands of dollars to physicians in any community

The Knickerbocker Adjustment Service Co, is making a supreme effort to render a better credit rating and adjustment service than was ever dreamed possible heretofore.

A FINANCIALLY RESPONSIBLE INSTITUTION

Bonded by the Fidelity and Deposit Company of Maryland

Phone or write for representative

Aurora Health Farm

Mendham Road, MORRISTOWN, NEW JERSEY

Beautiful country, elevation 700 ft., only one hour from New York. Open all year Diet, electro-therapy and hydro-therapy Personal medical supervision. Suitable for convalescence, compensated heart lesions, hypertension, rheumatism, diabetes, anemia, etc. Homelike atmosphere. No bed ridden, contagious or mental cases.

Robert Schulman, M.D Medical Director

Adolph Weixenhoffer, M.D Associate Physician

Telephone—MORRISTOWN 3260

"LONGVIEW VILLA"

The Hornell Sanitarium and Health Resort
(Operated by the Steuben Sanitarium Co)
HORNELL, N Y

A beautiful and modernly equipped sanitarium of 75 rooms situated in the foothills of the Allegheny Mountains (1 400 feet altitude) overlooking Hornell and the beautiful Canisteo Valley on the main line Erie Railroad from New York to Chicago offering all the modern forms of treatment for chronic and nervous cases, convalescents, and those requiring rest and change of environment. All forms of baths, together with massage, vibration and electrical treatments are given by a graduate physiotherapist. A neurologist has charge, with a strong Consulting Staff of six Specialists Delicious and balanced diet.

For rates write or wire the superintendent.—

THE DEAN, 302 East Twentieth Street, NEW YORK CITY

The cervical glands on the right side of the neck were somewhat enlarged

The treatment consisted in the application of a removable platinum radon seed into each tonsil, each seed containing 2 5 millicuries radium emanation These were removed on the fifth day The patient complained of a slight sore throat for the next ten days, but nothing of a pathological nature was evident The sore throat cleared up after gargling with milk of magnesia Examination of this patient two months after the radon implantation showed a marked atrophy of the tonsils, with the dilated crypt on the right tonsil practically closed Examination six months after treatment showed the tonsils to be mere fibrous masses with the dilated cryptic follicle at the right side obliterated The cervical glands are not palpable now, while the patient has been free from attacks of sore throat Examination one and one-half years after treatment confirmed my previous findings

Case 4—S L, age 57 Male. Gives a history of repeated attacks of tonsillitis, with rheumatic symptoms Has been treated for some time for repeated attacks of tonsillitis and rheumatism Examination January 5, 1927, revealed extremely hypertrophied tonsils which almost touched at the centre The right tonsil was very large and consisted of two lobes divided by a large crypt. A removable radon platinum seed was inserted into each tonsil, each seed containing 3 6 mc radium emanation There was no reaction noted except a slight sensitiveness at the right tonsil three days later, but this passed off in a few days Re-examination on March 18, 1927, revealed the left tonsil almost three-quarters gone while the right was only half its original size. On account of the size of the right tonsil, I implanted another seed on that side on May 12, 1927, the seed containing 2 7 mc. radium emanation Re-examination June, 1927, showed the left tonsil practically gone, a small fibrous mass being visible only The right tonsil was atrophied so as to be visible only on retraction of the anterior pillar The patient felt well and has had no further attacks of tonsillitis, and has not since complained of rheumatic pain He returned again for examination five months later and I found the condition had not changed He is still under observation.

Case 5—M C, age 33 Male Past history negative. Present history dates back to ten years ago when he had severe attacks of tonsillitis and has been complaining of sore throats ever since. Examination of the throat showed his tonsils to be very large, almost touching at the centre, the lower poles extending very low Both tonsils contained numerous crypts filled with cheesy material Examination of the nose revealed a hyperplastic ethmoditis with several nasal polypi present The treatment given on September 23, 1925, consisted in implanting a removable platinum radon seed into each tonsil, each seed containing 3 1 millicuries radium emanation No reaction was noticed At the next examination, October 15, 1926, the tonsils were considerably smaller, having shrunk to about one-half their original size. Three months later they were about one-quarter their original size. On March 15, 1927, the tonsils were found to be well behind the anterior pillars The follicles were practically closed and no cheesy material could be expressed Re-examination June 16, 1927, showed a similar condition except that the tonsils appear to be of a fibroid consistency No further sore throat or tonsillitis has occurred He was discharged as a "good result"

Case 6—L S, age 30 Female Previous history negative except for repeated sore throats Present history dates back to two years ago when after a severe attack of tonsillitis she began to have pain in her joints Examination of the throat revealed both tonsils considerably enlarged, the left being much larger Both contained several dilated follicles, the crypts of which did not contain any cheesy secretion on squeezing On December 24, 1926, a removable platinum

Case 6 Before Radium *Case 6 After Radium*

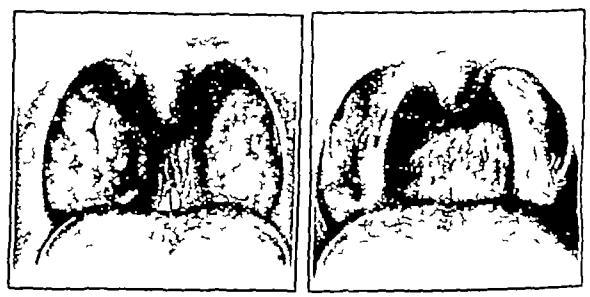
radon seed containing 2 7 millicuries of radium emanation was implanted into the left tonsil. In inserting the seed into the right tonsil, she jerked her head and grasped the instrument so that the seed came out of its container and before I was able to recover it, she had swallowed the seed I re-inserted another seed on December 28th, when the first seed inserted into the left tonsil was removed The second seed contained 2 6 millicuries of radium emanation An excellent result followed in this case The tonsils atrophied so that at the present time they are small fibrous nodules only She has had no further attacks of sore throat.

Conclusions

After watching results for the past five years, it is my opinion that we now have a satisfactory method for the eradication of diseased tonsils by means of radium in the form of radium emanation This is accomplished without any risk of fatality in inoperable cases The process has been so improved that we are able to obtain a complete atrophy of the tonsils without producing

fall out and be swallowed This has happened in several cases but without any ill effect

The macroscopical result of the radium action on the tonsil can be noticed between the third and fourth week after implantation At this time the tonsil has shrunk to about one-third or one-fourth of its former size From this time until about the sixth month after implantation a further shrinkage of the tonsil is noticeable and the open crypts become obliterated, thereby eliminating the focus of infection Where the radon seed has been placed centrally the end result should be apparent between the sixth and ninth months, at which time the tonsil should be distinguished as only a small fibrous mass just behind the anterior pillar



It is interesting to note that in a great number of cases with rheumatic and arthritic symptoms that were treated by this method, the symptoms disappeared at about ten days or two weeks after implantation Those in which the symptoms did not disappear admitted relief and improvement The history of sore throat which was present in practically all cases was eliminated There were a few cases in which the ideal result was not obtained These cases always gave a history of frequent attacks of severe tonsillitis complicated by peritonsillar abscess These unsatisfactory results I attribute to the fact that because of repeated acute attacks on the tonsils they become partly fibrous in nature and hence remain more or less resistant to radiation since radium exerts action on the lmphoid tissue only The crypts and their foci of infection in such cases become obliterated

As I have published a considerable number of cases elsewhere and time here not permitting, I am citing only six characteristic cases

Case 1—M R. F, age 43 Referred for badly infected tonsils He had been suffering with repeated attacks of tonsillitis which confined him to his bed He also complained of hoarseness which has annoyed him for the past three years Examination of the tonsils showed them to be very large, almost touching at the center of the pharynx The crypts were numerous and prominent Examination of the larynx showed two small fibromas on the anterior margin of the left vocal cord which accounted for his hoarseness He was advised to have a tonsillectomy performed but chose this method on account of sheer cowardice The treatment consisted in implanting on December 11, 1926, a removable platinum radon seed into each tonsil, each seed containing 2 9 mc radium emanation The seeds were removed on the fifth day, no reaction resulting

Examination one month later revealed the tonsils to have shrunk about one-half in size Six months later the tonsils were visible under the anterior pillars only The crypts were practically obliterated Examination ten months after implantation showed the tonsils very small, fibrous in character with all crypts obliterated No further attacks of tonsillitis have occurred The polypi on the vocal cord have not been affected and he intends to submit to an operation for their removal at some future date He is still under observation

Case 2—P B, age 32 Female Referred for several attacks of tonsillitis complicated by rheumatic symptoms The tonsils had been operated upon fifteen years ago, but only partially removed Her husband being a hemophiliac and having undergone the radium treatment of his tonsils successfully, she insisted upon this method, despite my assurance that a tonsillectomy could be performed successfully Examination of the tonsils showed them to be flat with the crypts dilated, some containing cheesy material which could be expressed by the wooden tongue depressor The left tonsil was considerably larger than the right She also had a marked maxillary sinusitis (confirmed by X-ray)

Case 2 Before Radium *Case 2 After Radium*

The treatment given on March 5, 1927, consisted in implanting into each tonsil a removable platinum radon seed, each seed containing 2 6 mc radium emanation The seeds were removed on the fifth day without any reaction following One month after treatment was started the patient felt better and the tonsils looked much smaller Three months later the right tonsil was just visible while the left was exactly beneath the anterior pillar Six months later, the right tonsil was only a small fibrous mass while the left was just visible The crypts were entirely obliterated No further attacks of tonsillitis occurred, while the rheumatic symptoms entirely disappeared

Case 3—P S, age 31 Male This patient had suffered from frequent attacks of tonsillitis for the past ten years and has been complaining of pain in his right knee recently This condition was attributed to his tonsils by his family physician Examination December 28, 1925, revealed the tonsils to be somewhat hypertrophied, cryptic in character and of a reddish appearance There was one noticeably enlarged and dilated crypt present on the right tonsil near its upper pole

patients and poor are human alike and it takes the same careful investigation for each to arrive at a conclusion More patients can be seen in a clinic by one man than in office practice because much unnecessary conversation can be eliminated

Any patient who comes to a medical dispensary should be considered sick until he has been proven otherwise If it is a pain in the knee, or swollen eyelids, or headache, the local symptom is not to be treated first They should give their chief complaint and follow it up with symptoms relative thereto

In Medical Clinic work, it is unnecessary to put down negative symptoms unless they relate directly to the case Negative symptoms are important in bedside histories for hospital records For the large number of cases handled in hospital Out-Patient Departments time and space does not allow the recording of all negative symptoms In a cardio-respiratory history complaining of weakness and cough, it should be recorded positively or negatively whether haemoptosis occurred, or night sweats, or dyspnoea But in a case complaining of headache, it is not necessary to record a negative history of haemoptosis, unless haemoptosis goes with the symptomology of the disease The principal points of the man's habits and past history should have their place, and any facts in the family history bearing on his condition A complete physical examination should be made on every new patient admitted, including deep reflexes If anything suggests a neurological condition, superficial reflexes, sensory and special tests for coordination and sense of position, etc, should be recorded in the medical examination

A Medical Clinic whose popularity has grown so that patients cannot be properly handled by the personnel should be limited in the number of new patients admitted A patient for medical consultation who cannot receive sufficient attention to have his history carefully recorded and a proper physical examination made had likely been better off if no visit had been made and he had sought advice elsewhere There are always extenuating circumstances when clinic cases are limited In emergencies, exceptions must be made and if the clinic is pressed to capacity there is the general examining room of the hospital to decide whether the case is a hospital case or not In private practice, a doctor must limit the time in his office and sometimes must make his appointments a day or two later than the patient planned A clinic and office sees comparitively few acutely ill patients, and it is not often that either must make exceptions to acute illness In two hours that a physician may give three times a week to the clinic, he is able to give a proper examination to three new cases in addition to the old cases that return to him for advice and treatment. The number of doctors must be limited to the space the dispensary affords, and as that space gives room to a given number of doctors, the number of new patients admitted should be in proportion to the doctors who handle them If clinic areas or districts supply more patients than the dispensary can receive, then either the dispensary facilities should be increased or the areas allotted to dispensaries made smaller, and new clinics built

The special laboratory tests, except in emergency, are rarely made on the patient's first visit to the clinic, unless the urine is done for some special purpose of quick examination The examiner, from the patient's anamnesis and status praesens, may not have the material required for a well worked up diagnosis Nevertheless, it is most important that a tentative diagnosis be put down Often, the physician's first impression is of great value to himself or the physician that takes the case up later The first impressional diagnosis is often a key to the situation It is no harm to put down on record a conclusion of one's thoughts from the data at hand It may be necessary to correct the diagnosis from further developments of later physical examinations or the aid of laboratory findings Too many histories are passed into their niches without a diagnosis The possibility of forgetting to put down a diagnosis is great unless a rule is made to record it on the first visit If, on further examination, there is reason to correct the original diagnosis it will, in all probability, be done Another danger of missing a diagnosis for record is that the patient may not return to the clinic again, or it may be several months or years before he does Even the same doctor, seeing this case several years later, would find his first impression of value, despite a thorough and painstaking history and physical examination

Every medical case in the clinic should have a routine urinalysis made A physician in his office who is not fortunate enough to have an electro-cardiogram, fluoroscope, or laboratory facilities for blood chemistries and other highly specialized tests, must send his patients to these different departments or specialists handling them to build up a framework for a diagnosis, if the case warrants it The clinic is more fortunate in this, especially the Medical Clinic, which makes the greatest use of these departments It is just as important to make a diagnosis in the clinic as in the hospital It is easier to bring these special analyses or tests to the patient when in bed in the hospital, and usually very much quicker But every patient coming to the clinic for diagnosis does not want to be put in bed for several days and the

any inflammatory reaction or injury to the surrounding structures of the tonsil There is no post-operative hemorrhage no danger of lung abscess, no aspiration pneumonia, no middle ear involvement The procedure is practically painless and should be performed in the office, the patient is permitted to return to his occupation and eat his usual meals without any discomfort or pain

In hemophiliacs the bleeding from the needle puncture is annoying sometimes but is never alarming and usually ceases after local treatment

Where the average dose consists of 2 6 mc radium emanation, it will be noted that in case number 5 a dose of 3 1 mc was used without distressing reaction The size of this dose was determined by the tremendous size of the tonsils

IMPRESSIONS OF A MEDICAL CLINIC

By BEECKMAN J DELATOUR, M D, NEW YORK, N Y

The Dispensary or Out-Patient Department of a hospital is divided into many specialties A doctor who has worked for a number of years in one of them becomes cognizant of the significance of the department he is in and knows the type of work to be done, the procedure of handling the sick, the method of examination and of keeping records It may be of interest to write out some of these opinions and ideas taken from a Medical Clinic

All roads of the hospital lead, directly or indirectly, to the medical clinic Patients requiring further treatment after leaving the wards and who have no private physician are referred to the Dispensary People who are sick and cannot afford to go to a doctor's office come to the clinic to find out the cause of their trouble and be treated for their ailments

A medical clinic should be, first, a diagnostic clinic in the hands of doctors who are equipped mentally, by training and judgment, to decide the best method of procedure for handling sick people It is necessary that physicians in the medical department of an Out-Patient Clinic should have a good, sound training in medical school and hospital training of at least one year They should have sufficient knowledge of disease based on school training, and a familiarity of hospital procedure, so that they may use the available means of the hospital, laboratory, r-ray and the special departments, for formulating a diagnosis

It is generally conceded that men starting out in practice should be associated with a hospital, and their first duties begin in the dispensary It is not to be expected their field of medical knowledge is of great scope, or that their diagnostic ability is infallible But the newcomer will find men of longer clinical experience than themselves whom they can consult with or refer to the chief of the medical clinic

It is in the medical clinic that the physician comes in personal contact with his patient It approaches more nearly a real responsibility than the house physician on the ward The interne is either checked up or supervised by his next superior officer or by his attending physician In the clinic, a pale-faced man may come in complaining of numbness, headache and digestive disturbances and be given a tonic or rhubarb and soda with no instructions to return, and the neglect of taking a blood count fails to reveal a pernicious anaemia Or again, he may come in complaining of pain in his chest and the neglect of a proper physical examination prevents the diagnosis of an early pneumonia The patient is sent out of the hospital to take salicylates in some form He may die at home or be fortunate enough to call in a more careful opinion Had the dispensary physician observed his patient was sick, in the absence of any positive findings on his part, he could readily call in one of his colleagues who might be of assistance in finding what he had overlooked

A great responsibility is given over to the doctor of a medical clinic, a trust to his honesty and integrity It is for this reason that men for this work cannot be selected too carefully They are trusted by the hospital authorities and, through the hospital, by the people with the responsibility of lives and gross errors or carelessness may produce serious results

There is nothing that simulates more closely the relationship of doctor to patient in office practice than in the medical clinic There is no reason why the same painstaking efforts in history-taking and physical diagnosis should not be made in the clinic as in the physician's office It is fair to the patient and excellent training for the physician, for if he attempts to slide through with slipshod work he will do the same with private patients Surely, private

of admitting patients to the general clinic and classifying them to the different branches of medicine. If there is the slightest question of diagnosis, the case should be referred to the medical clinic and when once this procedure has taken place, it is up to them to give the patient a free bill of health from that department before he is turned over to any of the specialties I go so far as to say this in cases of cataract and varicose ulcers, for if they reach the medical department they have a right to a general examination and the necessary investigations to rule out any underlying cause that contributes to any one of these conditions Of course there are many such cases that never reach the diagnostician, and in that way chance plays its part Then it is up to the specialist, if there is any element of doubt in his mind as to the cause of the particular pathology in his department, to decide whether further medical investigation should be made

It is a great help in the care of patients in medicine to have some branches of medical treatment classified, such as diabetic, gastro-enterological, tubercular, cardiac, arthritic, thyroid and cardio-renal, and have the patients treated in separate clinics It is not the purpose of this paper to go into the details of each or any one of these clinics, but it is important to stress that the chief medical clinic is the source and avenue of approach of each one It is not for the admitting clerk to decide from the patient who complains of cough, spitting up of blood, weakness or loss of weight and night sweats, that the case should go to the tubercular clinic It is a case for diagnosis, just as a case with swollen painful joints, and should be sent to the general medical clinic With the variety of cases to treat and diagnose in the medical department, the special branches are in a position to handle with greater facility and efficiency their particular branch of case They have their own social worker in their department to investigate the home conditions and the type of work the patient pursues, with possibilities of bettering the conditions and making them more suitable to the handicap of the patient. They can follow up diet and treatment and investigate the means and willingness to cooperate The tuberculosis clinics have their sanitariums and lists of convalescent homes suitable for treatment, and their tables for record The arthritic clinic and other medical specialties have special procedures for case records and treatment so that they can observe and treat patients more efficiently, with greater ease and less waste of time than could ever be dreamed of in a clinic where general treatments and diagnosis take place With all the convenient specialties at hand, there is a great tendency for doctors to hold cases over in the medical clinic, treating them in their own way and complaining of the large number of chronic cases that return each day, when they could readily turn them over to the specialties waiting for them Medical specialties are good in a clinic and they should be made use of freely by the doctors, both for the good of the patient and to relieve congestion in the parent clinic

The Out-Patient Department of a hospital should be a part of the hospital proper, and a liason should exist between the attending staff and the Out-Patient staff It may be difficult to find beds in the hospital for cases needing investigation or immediate attention because of acute illness In urgent cases, the best that can be done is to transfer to other hospitals where there are vacancies or with the aid of the social service, in mild infections, prescribe treatment to be taken at home If the patient becomes worse, as could be seen by a visiting nurse, they could be advised to go to a hospital at once They should be instructed to call up the hospital and the examining physician see to it that the patient is placed in a hospital, if his condition warrants A case sent in for diagnosis in the hospital from the diagnostic clinic should be of enough interest to the physician who sent him there to make occasional visits to see the results And, for his part in sending the patient to the hospital, he should give a fair resume of the case with his impression, which gives his reason for having the case admitted On the other hand, the house physician on releasing the patient unimproved, improved, or cured, should instruct the patient to return to the Out-Patient Department, provided he has not a private physician, in order that the clinic may follow up their patient and have a final record, if cured Each case returning to the clinic should have a summary of the history in the hospital, the essential points in special investigations, and the impressions and diagnosis in the case, together with the treatment If the patient is to return to the Out-Patient Department for further treatment, any suggestions from the wards for treatment should be put down on the same record as the summary of the hospital record

It is of great help to have visits from the attending staff There are often cases that need them for consultation and it is a valuable procedure to gather together any interesting cases that are under discussion and have them presented once a week by the physician in charge of the case to the attending staff It is helpful in clearing up many questionable cases and is stimulating to the clinical staff, and establishes a relationship between hospital and clinic

Summary

The medical clinic of the hospital holds an

hospital does not want to receive them, if the work can be done outside The hospital beds are kept for those who need them It is, therefore, of great importance that the X-ray Department, electro-cardiography, chemical, bacteriological and clinical laboratories be at the disposal of the dispensary as well as the wards It is also important that the physicians in the clinic be acquainted with the labor and expense of special tests so that routine blood chemistries and Roentgen Rays are not ordered on every headache or every cough The accessibility of the laboratory often inspires the new physician in the dispensary to great heights, and kindly supervision of his orders for the first few weeks may greatly lessen the burden of the laboratory

The importance of the follow-up of a patient is as worthy of attention as a careful diagnosis The person consulting a physician should be told when to make his next visit which, on the first return, should allow time enough to elapse for the returns on special tests or examinations that have been ordered The physician may heedlessly advise a return sooner than reports from the X-ray laboratory can come through and thus cause the patient a great deal of unnecessary time and effort Many of the people coming to clinics are hard-working individuals, or have families at home that require their attention, and it is with no little effort that they keep their appointments

Reports coming from the laboratories should be noted on the clinical sheet. All X-rays should be seen by the clinician and the findings and opinion noted down for record The reports sent in on slips from the different departments are easily lost and a space should be provided on the clinical sheet, after the history and physical examination, in order to have a complete record for the physician who has taken over the case, or the doctor who may carry on the case at a later date Of no less importance in the follow-up is the notation of medications and treatment, for one is at a loss to give proper care to a patient unless he knows the treatment that he has given before and the reaction Clinical notes are put down too infrequently and vaguely in many instances, and new developments or improvements in physical examination often fail to have notation Just because a patient has an excellent history recorded and a careful physical examination is no reason that should be his last chance Any new symptoms developing that may even suggest examination should awaken the physician to his duty to make a further one A chest that is under suspicion should be repeatedly gone over until a definite diagnosis of chronic lung trouble is made, or an acute bronchitis has cleared up This does not mean that if a positive diagnosis of tuberculosis is made the patient should be condemned, and never have a chance of examination again This, as we will see, comes under the head of another department, to be taken up in a general and brief way later Aside from the symptoms of diseases that may lead one to make repeated examinations, every medical clinic patient should have a re-examination every four months In this way, findings may be made which would prevent the patient from great inconvenience later and, at the same time, might avoid considerable embarrassment to the physician when a colleague is more thorough and, in going over the case, discovers a lesion or pathological condition that might have been discovered long before

Carelessness and laziness in medicine is inexcusable, and it is just as important for a man to be on the alert in the clinic as in private practice If he is so busy with his outside work that he must slide through his work with his clinic patients, then he had better give up his work there entirely If he is tired, or feels so below par that he cannot carry on with interest and enthusiasm and protect his work with care and painstaking headwork, then he had better lay up and take a rest.

A patient came to a medical clinic complaining of epigastric pain and vomiting The physician that the patient was assigned to immediately wrote out a slip transferring him to the stomach clinic Fortunately, a fellow-worker close at hand noticed the man looked sick and advised having his temperature taken He had a temperature of 103° and physical examination showed a large area of consolidation in his lung Such errors of neglect are inexcusable and show the fallacy of treating without diagnosis A doctor has no creed other than "Do unto others as you would have them do unto you" His duty is to find out to the best of his ability and senses what is wrong with a person and to use all his available means to that end If he cannot find out and is uncertain of himself, then ask for help He is *not to treat symptoms alone* or use any set system of treatment There are never two cases exactly alike, and no cult or cure-all was meant for a real doctor When he adopts this point of view, it were best he dropped out of the medical profession and became a bone manipulator for the treatment of colds, headache, or any other such ridiculous reason

The different branches of medicine that are so conveniently located in a general clinic are a great assistance many times in contributing to the medical clinician in making a diagnosis and also in cooperating in treatment But this convenience is not there to relieve the diagnostician of responsibility or allow him to play "the old army game" of "passing the buck" An experienced clerk is given the responsibility

weak and tired, though he continued his University work He did not have good night sleep, and frequently had early morning profuse cold sweats He consulted a physician, had marked migraine and anorexia He was finally admitted to the University infirmary Pulse 100, Resp 22, Temp 105°F The patient had a persistent cough, expectorating a purulent exudate, with pain in the anterior chest He had a diarrhea, with thin watery yellow stools, abdomen soft spleen enlarged, urine, a trace of albumen, 01% sugar, oxalates, a few casts Sputum, negative, Widal, negative r-ray showed increased density and some mottling over right upper lobe, left, some peribronchial thickening from periphery to hilum

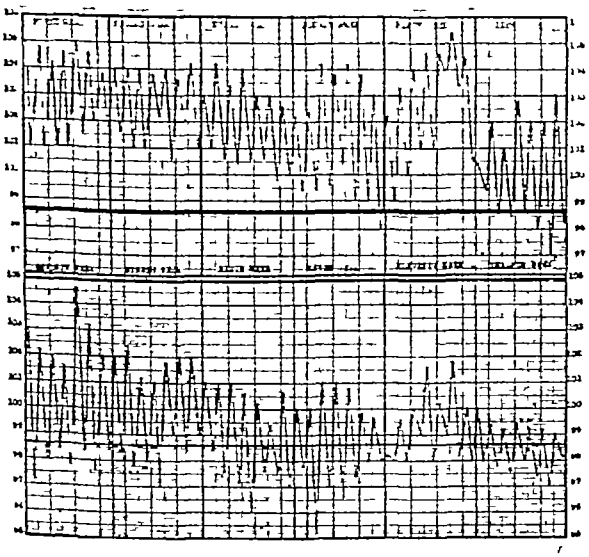

FIG 1 CASE 1

This ran a course of 12 weeks Two intravenous doses of mercurochrome were given, one with a severe reaction, succeeding the second dose a period of colitis again raised the temperatures This first patient was tentatively diagnosed typhoid miliary tuberculosis and malaria The diagnosis was finally established by the agglutination with abortus, the leucopenia, and by blood culture studies by Dr Carpenter[8]

These symptoms prevailed for a month with the sweats now occurring during each afternoon, with their concommitant period of anxiety (facial and mental), and the subsequent resultant prostration There also followed the resultant emaciation, anemia, the continued cough The patient developed an intense appetite, which when satisfied resulted in stomach pains whose reflex was located at the sternal notch There were wearing back pains, and the patient was constantly tired So he continued to March, when after an attack of indigestion, due to overindulgence, when the temperatures slowly but gradually returned to normal, at the end of the twelfth week This patient has had no recurrence (See Fig 1)

II A graduate student in economics, in the University, aged 36, married, negative family and personal history, had spent his summer upon a dairy farm Left the farm the last of September and upon the first week of November felt weak and tired In the second week had swell-

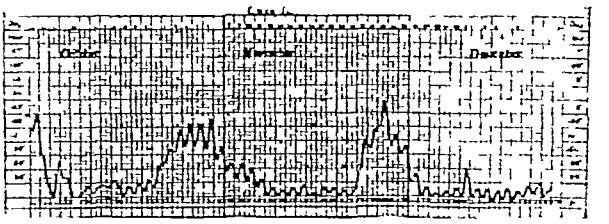

FIG 2 CASE 3

An undulant variant, showing two recurrences with short periods of temperature and covering a total of some twelve weeks There have been no recurrences since

ings of the ankles, legs and knees Had much pain, thought he had rheumatism, and sought a physician For two weeks he had no relief under salicylates At the latter end of November he had a temperature of 100.2°F Had had chills and periods of afternoon sweating The pains in the legs continued, often with blotches that for a time continued red and edematous Blood serum examination, as in I, was confirmatory of Malta fever, leucopenia, negative Widal, low agglutination There was a low glycosurea This patient continued to the end of December, gradually dropping to normal with no recurrence

III A laboratory worker, who had had during October, November and December, 1926, three exascerbations of the temperature and pulse, and during these exascerbations showed all the classical clinical symptoms, but due to these periods being short, had little resultant anemia and prostration (See Fig 2)

IV An adult mother of family, through May, June, July and August, 1927, presented all the characteristic symptoms and blood findings Also, has had no recurrences

V, VI VII, VIII All young adolescent students admitted to the University infirmary during a period of prevalence of winter colds and grip—January, February and March, 1928 They were each differentiated by blood serum tests, Widal, paratyphoid, malaria, undulant, and true Malta They illustrate the short forms of undulant fever, with relatively little of prostration, anemia and emaciation (See Fig 3, Cases 5 to 8)

IX In February and March, 1928, an adult matron had a fever running a course simulating undulant fever, giving many and most of its classical symptoms, including its leucopenia and to some extent its resulting anemia The blood serum, though taken at several intervals, at no time would give the agglutination characteristic of Malta fever There may yet develop in time

important place, and is the hub around which much of the work centres and radiates from

The responsibility of the physician in the dispensary is great, and although chosen for the work in early experience, the choice should consider the personal responsibility of the doctor, hospital training, and medical education

The first consideration of work in the medical clinic is diagnosis, using all available means to draw the right conclusions A comprehensive history and complete physical examination should be made on every patient

Dispensaries should not be overcrowded beyond the capacity of work of the physicians This will avoid hurried, careless work.

A tentative diagnosis should be made and recorded on the first visit, both for record and to assist the doctor It is often a great help to know the first impression gained from the patient's story given on the first visit, and the physical examination

Special laboratory tests should be available and used with discretion Laboratory work in collaboration with the clinic is necessary All procedures of investigation that can be done without discomfort or danger to the patient should be done, both as a convenience to the patient and to avoid hospital crowding, and save beds for those who have the greatest need

Treatment of patients is as important as diagnosis, and to secure proper treatment, careful clinical notes should be kept and notations made of all medications and treatment

Patients should be examined and treated in a medical clinic when once referred there, and not transferred to another department of the general clinic until they are proven exempt from general medical treatment The other departments should be used as a means of investigation for general medicine

Several branches of medical treatment should be classified and treated in separate clinics, which will facilitate the work and give greater efficiency

The Out-Patient Department should be a part of the hospital proper and in transferring cases, summaries of each should be sent from the clinics to the ward and vice versa

The attending staff should make weekly visits to the clinic to aid in consultation and to add a stimulating interest to the physicians of the clinic

---

UNDULANT (MALTA) FEVER (A)*

By LUZERNE COVILLE, M D, AND CHARLES M CARPENTER, M D, ITHACA, N Y

A BRIEF review of the work of Dr Bruce[1] and the British Admiralty, the Army and Civic Organization of Malta, 1905 to 1910, the reduction of incidence in British troops from 643 in 1905 to 1 in 1910,[2] the infection being about 10% in goat herds

Review of Bruce's Septicemia *Melitensis* of 1888 with locus in the spleen, the succeeding work of Bang upon *abortus* in 1897,[3] followed by the work of Miss Evans,[4] Wright,[5] Semple, Lake,[6] Hardy,[7] Smith,[9] Carpenter,[8] and[10] Wadsworth, Thomas and King

Review—Malta or undulant fever,[11] due to Brucella Melitensis or its variant, Brucella Abortus—an ingestion septicemia due to raw infested goat's milk or the raw cow's milk infected by contagious abortion The incubation is 15 days There is afternoon rise of temperature to 102-3°, or more, often succeeded by a profuse daily perspiration, by an attending anemia and weakness, constipation or diarrhea, anxious afternoon facies, abdomen flat, spleen enlarged, insomnia, often joints simulating arthritis

Treatment—General hospital care, urotropin in the late stages Commercial vaccines give no results

There have been offered many scattered reports giving incidence of undulant or Malta fever throughout the world and in many states in America The history of the first appearance of this disease in a community is rather an anomalous and a disconcerting one Many diagnoses may be given and many unsatisfactory explanations had until by fortunate laboratory findings it is at last—often at long last—determined The characteristic leucopenia should at once put it under suspicion Once found in any one community, other eruptions of the disease are sure to follow and diagnoses made

The source of the disease, the epidemic abortion in our herds, is distributed widely throughout the state The wonder is not that there are so few known cases, but that there are not many many more and many of those fully diagnosed The exact determination is almost purely a laboratory one Many of our laboratories are now equipped for the blood determination

No effort has been made by us to give the "textbook" picture of undulent fever

Of the eight patients in one community whom we are considering now, two appeared in the spring and fall of 1925

I A student in the poultry husbandry, aged 26 years, Cornell University, had enjoyed good health until the latter part of January Past and family history were negligible He began to feel

DIABETES AND INFECTION *

By HENRY JAMES SPENCER, M D , NEW YORK, N Y

THE lot of a diabetic patient improved greatly with the better understanding of the roles of the foodstuffs, which grew rapidly in the years centering about 1914 when Allen presented the results of his work on the role of the fats and allied topics Again in 1922 the isolation of insulin promoted the well being of these individuals Coma was successfully subdued by diet and insulin Years were added to the average length of life of diabetic persons This longer period greatly increased the chance of acquiring infection Joslin has pointed out that one out of every two or three subjects of diabetes is now a potential subject for surgery Root and Warren have shown that in the Naunyn statistics of 1906 the great majority of the deaths were due to coma and pulmonary tuberculosis while in their own statistics covering the years 1925-26, conditions are exactly reversed, surgical conditions providing the chief causes of death

Three opinions have long been held concerning diabetes both by the laity and by many physicians

First, that the diabetic is rather more likely than the non-diabetic person to acquire and then suffer severely from infection

Second, that his disease becomes more severe (i e the carbohydrate tolerance is reduced) and less easily controllable and acidosis is more easily established when infection is present. We have all seen examples of the mild, previously unsuspected diabetic who acquires an infection and suddenly undergoes rapid dissolution The infection spreads or progresses very rapidly, acidosis and coma supervene, septicemia sets in and collapse and death follow so rapidly that the patient is gone before we can start to fight

Third, that surgical procedures, always dangerous for the diabetic individual, are much less safe when infection is added Any of us can recall some emergency operation on a diabetic followed by coma and death or by later infection of the wound, failure of healing and death from inanition or sepsis

Insulin has changed all of this and saves many who formerly would have died Surgical procedures today can be as safe, or nearly as safe, for diabetics as non-diabetics The unrecognized diabetic is now the one who suffers from surgical procedures We must watch for and diagnose diabetes earlier and more accurately I am tempted to advise a blood sugar determination as well as the routine urine examination and blood count for every patient about to undergo operation It would save us some disasters There are a good many untreated diabetics, especially those over 40 years of age, who excrete sugar in the urine not at all, only occasionally, or only in one or two of the day's voidings

The physician can face with greater assurance the problems of a patient under good dietary control who develops an infection than those of one who has had poor or no treatment and having an infection at the first visit What an argument we have here for urging patients to seek control and do their important part toward it when one in three will profit so greatly by correct care when his time comes! And control today is nearer normal living than it has ever been and affords great likelihood of maintaining a physical state and stamina equal to active, productive living

Infection works havoc with the diabetic even when insulin is available The tolerance is reduced, the effectiveness of insulin is greatly reduced as measured by the amount of carbohydrate over and above the self-tolerance which each unit of insulin will handle, and acidosis and coma very often follow I saw two striking examples early in my experience with insulin The first was a middle aged woman who was brought into the hospital at night in deep coma, and with an elevated temperature, marked acidosis, vomiting, rigid abdomen, and a blood sugar of 0 70 per cent I spent the night at her bedside making blood sugar determinations every two hours and administering glucose and insulin in heroic doses By eleven a m she was conscious, her blood sugar had fallen to 0 25 per cent and diacetic acid had about disappeared from her urine Her total leucocyte count was 28,000 and fell only slightly with the clearing of acidosis Her urine contained a large quantity of pus We made a diagnosis of infected left kidney and worked vigorously to prepare her for an operation The second morning an interne thought he detected signs of insulin shock and took it upon himself to discontinue the insulin and administer glucose without consulting anyone The patient straightway returned to deep coma and died in 5 or 6 hours despite all we did for her Her terminal blood sugar was 1 03 per cent. and her acidosis was profound Autopsy revealed a sound right kidney and a left kidney riddled with abscesses and surrounded by a huge, perinephric abscess At that day I am not sure that I could have prevailed upon a surgeon to touch her

The second was an old Italian woman who had developed gangrene of a foot which spread, became infected and in the course of four weeks killed her The surgeon would not am-

*Read before the Rockland County Medical Society, Sept. 26 1928

this quality We are including this temperature chart (Fig 4) in our memorandum

The prevalence of contagious abortion in our milk herds throughout the state is so general, that it follows there must continue for a considerable time occurrences of the fever in many communities

The disease first appeared in Ithaca in the Spring of 1925 [8]

It is interesting to note that from cultures of

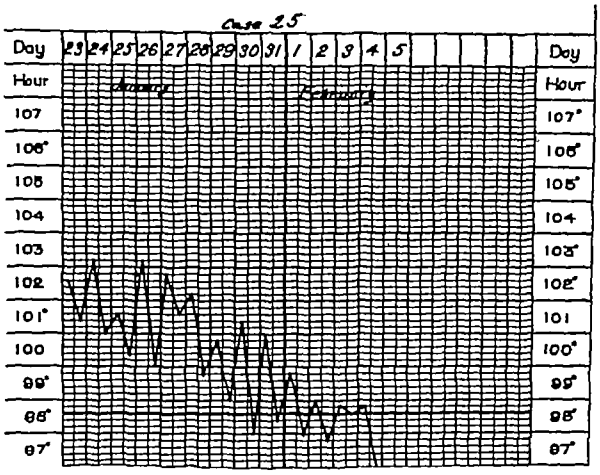

FIG. 3 CASES 5 TO 8 .

These simulated typhoid They showed characteristic leucopenia and are remarked for their short course Both agglutinated with fairly low titers, but only one gave a blood culture

three of these patients virgin heifers were infected and all three aborted

Again, we wish to reiterate the axiom that undulant fever once found and demonstrated in a community, other occurrences of the disease surely are found and identified

Milk herds throughout New York State seem to show about 10% are infected with *abortus*

Laboratory assistants are prone to be infected and several such undulants have been noted

The laboratories at present equipped for diagnosis are those at Ithaca, at Albany, at Clifton Springs and at Mt McGregor

The differential diagnosis in the laboratory is to be established as between influenza, malaria, tuberculosis, typhoid, paratyphoid A, paratyphoid B, Malta, undulant, and tularemia

The occurrence of undulant fever in this state at this date is approximately as follows

Bellevue Hospital, 4 plus, Buffalo, 1, Ithaca, 10, Clifton Springs, 9, Albany (laboratory), 22, Newark, 4, Utica, 3, Auburn, 1, Olean, 1, Cortland, 1, Rochester, 1, Little Falls, 1, Watertown, 1

Undulant fever due to Brucella abortus in cows is possibly a variant of Malta fever in goats (Angoras) In Iowa, Albert,[12] 1928 announces his belief that "there are three types of the bacil-

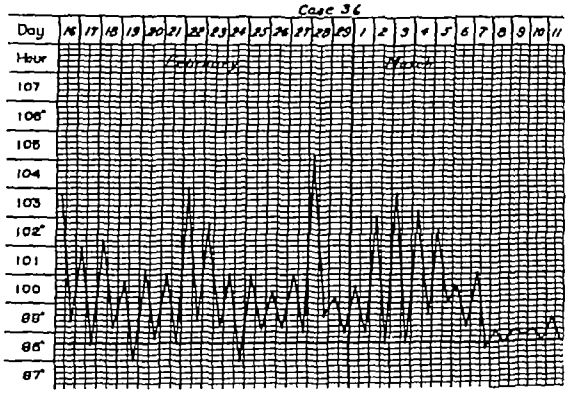

FIG 4 CASE 9

This is a somewhat similar chart and clinical history accompanied by the characteristic leucopenia There were no results with agglutination nor culture

lus abortus, one affecting sheep, another cattle, and a third one hogs To differentiate the type requires the application of agglutination absorption tests"

There seemingly has been a stepped-up virulence in *abortus* during the past 20 or more years since the work of Bang

One worker, Theobald Smith,[9] may be noted as urging delay in assuming abortus to be coequally the cause of contagious abortion in cattle and undulant fever in man He seems to believe that we have as a cause of undulant a variant simply of Brucella Melitensis

Undulant fever has appeared in Texas, Arizona, California, Iowa, Michigan, Ohio, New York and Massachusetts, as well as many another state, many not yet recorded

which lead to calcification of the arteries This process is not limited to patients of advanced age but begins early in life, even before 20 years of age For a while, that is before calcium is deposited, the process is reversible, in the sense that larger carbohydrate metabolism can lead to the removal of the cholesterol deposits

As a working rule do not think of infection as the cause of diabetes Think of it, even in its least impressive forms, as able suddenly to render florid a previously mild diabetes The extraction of a tooth, a tonsillitis, a furuncle of the neck has led to the sudden unveiling of a diabetes so mild that it was not discovered previously, and now so severe that control is difficult If with this a septicaemia sets in, the die may be cast despite our aid I assure you that if you ever work much with diabetic patients you will gain the healthiest respect for the most trivial of infections Clear them up as fast as you can by advising extractions of teeth, tonsillectomies, and the like while you carefully keep the patient's diabetes in control

Because coma with infection is so much more serious, never rest from looking for infections while you are treating a comatose patient, until he is rendered free of acidosis and subsequent observations and results prove that no infection exists It is the undiscovered or overlooked tonsillar or peritonsillar abscess, paranasal sinusitis, mastoiditis, pneumonia, tuberculosis, empyema, cholecystitis, kidney abscess or pelvic abscess that humbles the physician and kills the patient. Surface infections such as carbuncles, erysipelas, cellulitis, local abscesses, are more easily found Blood cultures should be taken whenever possible, for their prognostic value if for nothing else

Do not trust these affairs to a young assistant or a hospital interne Such matters call for the utmost skill Do not be casual about your diabetic patients Learn about foodstuffs and diabetic dietetics and prescribe diets as accurately as you would your most critical prescriptions Make greater use of blood sugar examinations Do not depend upon urine examinations alone I have many true diabetic patients who pass considerable quantities of sugar in the urine while repeated blood sugar examinations at various times during the day show very satisfactory figures I have other patients with blood sugars of 0 3%-0 4% who never show sugar in the urine. I can relate other irregular states which would never have been found without blood sugar determinations Patients must have lifelong and frequent supervision by their physicians They must be taught not to treat themselves

When it comes to surgery, I can speak only as a physician who has seen all degrees of surgical skill employed on diabetic patients There is only one surgeon who should be employed—the very best you can get The best is never too good If he has modern experience with the surgery of diabetes so much the better Nowhere is there so great a need for the closest, finest, most harmonious team work between physician and surgeon In hospitals, surgical diabetic patients should be seen at least daily by both physician and surgeon The surgeon, whenever possible, should wait the word of the physician that the patient is ready for operation

In order of importance, the *pre-operative aims* are—1 Freedom from acidosis, 2 Freedom from dehydration, 3 Reserve store of carbohydrates in the tissues, 4 Reasonable carbohydrate-insulin balance Since general anaesthesia leads to more rapid glucose utilization, it is well to give more rather than less carbohydrate before operation, and to be guarded about the dose of insulin. *After operation* Control the sugar balance with great care, examine the blood or urine or both every hour or two, and supply carbohydrate by mouth, rectum, or vein, with or without insulin Avoid both hyperglycemia and its companion, acidosis, and hypoglycemia and shock The total daily dose of insulin should be given for 24 hours before and two or three days after operation, in frequent, fractional doses which can be increased, decreased or omitted as the findings indicate, thus attaining a smoother course

A few days after operation, regular diet usually can be resumed and the insulin required can be judged closely from the post-operative experience

Wherever a simple, quick proceedure for release of pus can be carried out it should be done Examples of what I refer to are 1 Excision of the necrotic center of a carbuncle and free undermining of the skin and laying back of flaps until healthy subcutaneous tissues are reached 2 Simple mastoid opening to release pus, leaving the radical operation until later 3 Simple incision and drainage of a perinephric or other approachable abscess with radical measures undertaken as soon as enough ground has been gained Local anaesthesia, gas and oxygen, ethylene, and spinal anaesthesia have proved safest. Ether can be used at moments when good relaxation is desired

Beyond this you should refer to the writings of Joslin, Lahey, Jones, Root, McKittrick and others for the details of medical and surgical procedures

I shall now speak of some specific infections and interesting facts about them, first some chiefly medical infections

putate her foot, only incised the areas where fluctuation appeared She died of septicemia Her initial blood sugar was over 0 60 per cent and despite 150 to 200 units of insulin per day never fell below 0 40 per cent whether carbohydrate was given freely or restricted

Oftentimes the precomatose or comatose patient has a history of severe pain in the epigastrium or chest, shows an elevated temperature and pulse rate, vomits, and has a rigid, tender abdomen and an elevated leucocyte count with a relative polynucleosis Not all of such patients will favor us with a pyuria or other unmistakable localizing sign of infection Is an infection present with the coma? The greatest degree of common sense in judgment is called for The antecedent history may point out an active infection which precipitated the coma The risk of operation during coma is very great, but, in a favorable case, bold surgery, under local anesthesia if needed, can give a margin of safety which increases the chance of recovery If my patient's perinephric abscess simply had been drained, she might have had a better chance of recovery Usually we should attack the acidosis first Frequent leucocyte counts may help us to determine whether we are dealing with the white cell increase which accompanies acidosis and disappears with its relief or the sustained or increasing numbers which mean active infection Remember that the leucocytosis of acidosis without infection may rise very high—(25,000 or 30,000) and include a high polynuclear percentage (80—90 per cent)

Often huge doses of insulin must be used to relieve severe acidosis with coma 150 to 200 units in 12 to 24 hours is usual With infection the required dose tends to run higher I have frequently used 300 to 400 units to bring a patient back to consciousness The kidney abscess case which I cited required over 500 units in the first 16 hours The ideal method is to give frequent doses of insulin with as many grams of glucose as units of insulin I am in the habit of giving part of the insulin by vein and part subcutaneously for the first dose or two, thereafter using only the subcutaneous route I stay with the patient until consciousness is restored, taking blood and urine samples every two hours for quantitative or qualitative tests for sugar and acetone bodies It takes little equipment to do these tests at the bedside

Great is the danger of frequent, rapid or large changes in establishing the regime of a severe diabetes with or without grave complications Omitted doses of insulin during mild acidosis may precipitate a sudden severe acidosis with coma

The subnormal temperature of the precoma and coma stages must be combatted by external heat Fluid must be furnished to the dehydrated tissues rapidly and by every available route, mouth, rectum, vein, subcutaneous tissues, and the peritoneal sac The rise in temperature which frequently follows hypodermoclysis is at times so confusing that I do not use this method as often as many physicians do The rectal route is available, after a cleansing enema, and may prove useful for several days though it has often disappointed me Absorption is often slow and the rectum frequently becomes irritable and rejects fluids I have had pleasing results when using the venous or the peritoneal route, the latter especially in children For over three weeks I gave 20% glucose solution by vein (50 to 100 gms of glucose at a time, with insulin added) 3 and 4 times in the 24-hours, to a non-diabetic patient for whom this was the chief food Only enough food could be given by mouth to insure her receiving her protein and fat requirements Her veins were so well preserved that she was given two "replacement" transfusions, of 800 and 1000 c c respectively, towards the latter part of this period without any trouble The first time that a 50% solution of glucose was injected into a larger vein it caused a phlebitis

Removal or drainage of a focus of infection frequently leads to a marked increasing of the carbohydrate tolerance Therefore care must be exercised to see that the amount of insulin used after such treatment is not large enough to induce insulin shock The urine, and blood sugar, are the best guides If insulin is not used, the diet should be increased if there is evidence of hypoglycemia If insulin is used, both the dose of insulin and the dose of carbohydrate may be manipulated to offset danger

Whenever possible it is well to manipulate these so that the diet contains a total of 100 gms of carbohydrate plus 1 gm of protein for each kilogram or 2 2 pounds of weight Fat can then be added to increase the caloric intake If necessary, as much as 175 gms of fat can be given to most adults taking such a diet We should use less fat if the patient's weight can be maintained while he is physically active You will find that patients taking diets proportionally high in fat require relatively large doses of insulin to keep them sugar free, and, conversely, when the fat is decreased the patient can be kept in balance with less insulin

High fat diets should be avoided for another reason Joslin and others have shown that in diabetes the blood fat and the blood cholesterol are easily increased by high fat diets Furthermore, these substances have much to do with the establishment of arterial sclerosis, being laid down in the arterial intima and there forming the basis of calcium soap deposits

COMMON PROBLEMS OF THE SPECIALIST AND INTERNIST*

By FRANK M SULZMAN, M D, TROY, N Y

When your Chairman requested a paper, the question of what topic would appeal to both sections of our Society came up for consideration Whatever specialty you follow, we all agree that our work and that of the internist is very closely associated, in fact, a large proportion of our cases are referred How then, can we handle these problems that naturally come up so as to avoid controversy, promote good feeling and encourage the close relationship with our medical and surgical conferers, including also the X-ray, laboratory, pediatrician, neurologist and the dental fraternity?

Can I ask your cooperation and suggestions as how to best put over this program? That we should in our County Society meetings take for subjects papers that will cover these questions and so place them where full discussion will aid and clear much that now is subject to discussion and doubt Help solve in a practical way what we all desire and give something that can be read with profit and interest at such a meeting Where a subject pertaining to our specialties often fails to hold the attention it deserves and which only is appreciated by a group such as this section and is wasted effort for a general meeting

One of the first questions asked by our conferers and one we all are interesed in is the diagnosis This may be simple or require much time, repeated examinations and still be a questionable point when everything is done to determine it

How, then shall we act when a diagnosis is already made, so reported to the patient, and come to us for its treatment? You examine the case and find differently with corresponding change in treatment Here tact and excellent judgment must be exercised to keep peace and make everybody happy

Would it not be wise for us to suggest to our friends to send their diagnosis which we all are interested to know, on a card, sealed or in some way, so the patient will be unaware of it and avoid the misunderstanding the old method is likely to cause?

The above is common experience with nose, throat or ear condition, rarely this happens with eye cases

Eye—One of the most common conditions, an every day accident in manufacturing establishment, a superficial or deep foreign body of the cornea

I know, but I repeat what you have all seen and experience an eye that has had repeated attempts made to remove these foreign bodies without proper light, many times pure guess work as to exact location, cause severe trauma to cornea, intense pain to patient, infection and ulceration follows with more than necessary loss of time from employment and still worse a 50 per cent or more loss of vision from resulting scar on cornea Is it any wonder that the insurance people who pay these bills but who in turn pass it on to the manufacturer in extra premium, etc, and who in reality pay, have begun to eliminate this extra and unnecessary hazard by sending them to properly qualified men How many cases do you see where attempts have been made to remove without even using cocaine or similar anaesthesia? What better way could we help stop this unfortunate practice than by showing how foreign bodies should be removed, how impossible it is to remove without proper light, anesthesia and instrument How these wounds heal with practically no scarring Far different is the result when extra corneal tissue is injured in attempting to remove with resulting infections and scarring, show what this means to vision and last but not least, the appearance of the eye

Another group that we could with profit spend some time, is the gastric symptom associated with glaucoma It is not rare to see a case with well marked glaucoma, with no light preception remaining hopeles as to vision that you get a history of nausea and symptoms attributed to dyspepsia or some stomach disorder and be so treated and the eye be the cause The eye condition is often given as the sequel of the gastric symptom overlooking the fact that the reverse is the truth, have mentioned these two types as typical of the cases that we could all develop and elaborate on in our work before our County or mixed society meeting A purely technical paper before such a group is not appreciated and now that post graduate instruction is in order I feel it opportune to ask your cooperation and thought in these matters

Optician—Explain what we do in examining an eye, its importance and the detail gone into to get facts Contrast this with the optician's examinations—the result in the majority of their cases is to get a pair of glasses

(a) How many are treated for neuralgia, hysteria, and allied conditions when an eye examination will clear up a large percentage A test of vision alone—of very little value in these cases Under a mydriatic, accommodation at rest, how different the result, we order glasses for more with normal vision, so called, yet suffering from astigmatism accommodative errors, muscle and other conditions than we do for those with diminished vision Explain focal infections, a real condition where they have a case that is not doing well, don't wait until the patient becomes dissatisfied and seeks the specialist who may find the cause in the common sources of focal infections, teeth, tonsils, and simuses Let them suggest seeing one who will examine these import-

* Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 23 1928

Pulmonary Tuberculosis When your diabetic patient is doing poorly, constantly shows urine sugar or a high blood sugar, or continually loses weight, be sure whether, besides pyogenic infections, you are not dealing with one of two great enemies, serious alike for the diabetic and the non-diabetic person, namely *Tuberculosis and Cancer* Examine the lungs of your patients frequently Take, or get them to take, their temperatures by rectum several times a day for two or three days at a stretch and keep the readings in your records Watch their pulse rates and their blood pressures Secure roentgenograms of their lungs when you first see them, for comparison with later records Urge them to come to you regularly If you fail in this you will surely lose a patient here and there whom you could have saved

Acute Medical Infectious Diseases Beyond the usual methods of treatment plus painstaking care of their diabetes there is nothing we can do for our patients who contract pneumonia, typhoid, measles, scarlet fever, diphtheria, whooping cough and mumps Insulin helps a great deal Somehow I have had less trouble with the diabetes of such patients than I have where tonsillitis or influenza has intervened The number of diabetics in whom these infections have developed are so few in my records that statistically they are worth nothing I have the impression that they have done about as well as non-diabetics with the same disease

Gall Stones The pleasing improvement in tolerance which followed removal of gall stones in several patients with acute symptoms lead me to advise others with less fulminant symptoms to undergo operation A few (3 or 4) followed the advice, none died, all are more comfortable, and all but one has had a considerable improvement in tolerance For example, one woman dropped her insulin dose of 12 units a day, increased her carbohydrate intake 40 gms per day, and has a lower average blood sugar level 12 months after operation

Appendicitis One male patient with a chronic catarrhal appendicitis which periodically became mildly acute, had the appendix removed after much urging and now takes a more liberal diet and seldom shows sugar in the urine whereas previously it appeared with every exacerbation of the appendical infection His blood sugar levels are nearer normal

A patient fifty years old with marked hypertension surprised us by having an appendicitis with so little distress that she did not speak of it but developed a peri-appendiceal abscess which gave her pain and this called her attention, and then ours, to it. She had been taking a low protein—low salt diet, with about 60 gms of carbohydrate and 15 units of insulin for some months, and kept very well on it. She was physically so inactive and so far overweight, that I had not increased her ration The abscess was opened under local anaesthetic, drained and healed She kept the same diet but gradually reduced the insulin to 5 units She died two years later of cerebral hemorrhage

An Overfunctioning Thyroid Gland can so increase the metabolism as to lead to suspicion of infection and can change a mild diabetes into a severe one Either iodine therapy followed by surgery or surgery alone, together with insulin are of great aid here. I mention this complication principally to put you on your guard Such a situation is very difficult to handle

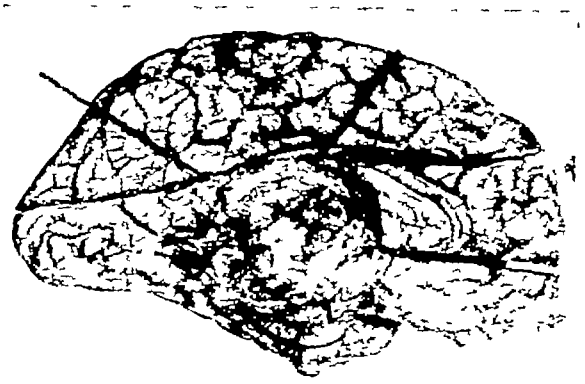
Arterial Sclerosis and Gangrene This accounts for the disabling or death of most of the diabetic patients over 50 Prevention should be our aim Consider every diabetic over 40 as the subject of arterial sclerosis which must be actively combatted I have already spoken of the importance of keeping the proportion of fat in the diet within moderate bounds, especially if little carbohydrate is being utilized There is reason to feel that well controlled diabetic patients develop gangrene much less frequently than those out of control. Aside from this general measure of diet we have local measures which aim (a) to prevent injury to the feet, which opens a portal for infection, and (b) to foster a more vigorous circulation by developing the arterial by and end paths, and bringing on hyperemia Cleanliness of the feet, prompt, active care of skin diseases or skin injuries, proper shoes, proper nail paring, and treatment of calluses, are examples of methods for meeting the first aim The ultra-violet ray, Buerger exercises, bed gymnastics, and local heat and cold are examples for the second aim

Once gangrene and infection have set in, I see no safe way out except through surgery, radical and early surgery Time should be taken to prepare the patient thoroughly for operation The occasional case will recover by medical means, but I would be ready moment by moment for the surgeon Too many patients I have seen who appeared to be holding fast and demarcating, when suddenly the process appeared inches above the original site or the patient developed a septicemia and died

told that he lost it in the bath room This occurred finally the third time He was warned not to disturb his dressings and our suspicions were confirmed when he was sent down to the X-ray room and an X-ray made of his stomach Here we found the three tubes pushed down into his stomach by this young rascal I show you a picture of the X-ray taken at this time An attempt was made to look into the stomach with a short esophagscope but due to the fluid in the stomach, it was impossible to get a clear view Dr McGarrahan, Jr, by palpitation and forceps was able to remove these tubes through the gastrosphy wound Here was a case where several agencies all had to work in conjunction The end result, a boy restored to health and usefulness

UNUSUAL LOCATION OF SOLITARY TUBERCULOMA*

By MORRIS GLEICH, M D, AND A. M. SALA, M D, NEW YORK, N Y



H. M, a colored girl of 3 years, had had a cough for four months, had lost weight and was constipated One week before admission she was unable to raise her right arm over her head and could not walk She was acutely ill There were stupor, rigidity of the neck and internal strabismus Broncho-vesicular breathing was heard over the left upper lobe anteriorly and moist subcrepitant rales persisted at the left base anteriorly and posteriorly Her tongue deviated to the right and there was a drooping of the left side of the mouth There was a lower right facial paralysis, the right arm and leg were held in flexor position and were spastic The deep reflexes were hyperactive, the right more than the left. Both knee jerks and the right abdominals were active, the left abdominals barely present. There was a definite left Babinski and a questionable Babinski on the right side

Spinal taps on several occasions revealed clear fluid under markedly increased pressure Examination for glucose and globulin was negative, a few mononuclear cells were present, but no acid-fast bacilli The eyegrounds disclosed nerve heads clear in outline, with veins somewhat enlarged and the right disc elliptical The Mantoux test was positive The blood counts averaged 8000 W B C, 76% P and 24% L Kahn test on blood and spinal fluid negative

Two weeks after admission the pneumonia still persisted and was confirmed by *x-ray* The latter showed an area of consolidation through the right pulmonary field due to lobar pneumonia and some infiltration of tubercular origin The child succumbed in a few days

The autopsy revealed an encapsulated, solitary tubercle 4 cm x 3 cm x 2 5 cm in the left cerebral hemisphere, above the optic chiasm It had a caseating center There were no signs of a meningitis The brain meninges were moderately edematous The right lung was studded with tubercles and a cavity 3cm x 3 cm was present in the posterior upper portion of the lower lobe The left lung presented a well marked apical tubercular infiltration The mesenteric lumph nodes were enlarged There was internal hydrocephalus The histology of the tumor was that of tuberculosis

Comment Solitary tuberculomata are rare, are most frequently found in the cerebellum

Unusual location of solitary tuberculoma

and are superficially located They usually arise from the meninges and grow inwardly

The tubercle herein described, was in the cerebrum, was centrally placed and showed no meningeal involvement Of distinct interest also is the fact, that in spite of its size and location, the tubercle gave few eye signs and no neurological manifestations, until two weeks before death It is quite easy to be misled if one looks for the cardinal signs and symptoms of brain tumor, e g, headache, choked disc, slow pulse, vomiting, convulsions Our patient had a rapid pulse, no convulsions no choked disc and seldom vomited

* From the Pediatric and Pathology Departments Harlem Hospital New York City

ant sources of infection and get proper reports Our co-workers, the *x*-ray and laboratory are of great value to us in settling the question of diagnosis Valuable information is given to all from such a study

(b) Would it not be wise to suggest at least a yearly examination after forty, of the eye for possible changes that many times show first in the eye grounds?

Strabismus—Told in some cases by the family doctor to let alone and so several years elapse before we see the case It is not difficult to show the value of getting these cases early The result speaks for itself Training, proper refraction, contrast with the neglected case

Ear—Impaired hearing associated with various nasal conditions If operated on for these nasal conditions, the patient naturally expects a result Believe a more guarded prognosis wise There is a tendency to say nothing can be done, it is hopeless Do not give up the case of impaired hearing without a fair trial at treatment If we can arrest the condition and hold the hearing we have certainly accomplished something for them The writer appreciates that the treatment in many cases is unsatisfactory Take the operation case that progresses well and wishes to go home, this request also made by the doctor, sending you the case Do we do right in sending cases where sinus treatments, mastoid dressings and the like are needed, back to the general practitioner who has had no special training in the care of such a case? My personal experience has been it is best to keep these cases under your own care This may seem selfish but a knowledge gained after a varied experience in attemtping to follow the former course has been to see a fatal issue occur, prolonged convalescence and an unsatisfactory result in more than one case

Foreign Bodies—Air and food passages They are always in a haste to have something done You are called and told a child has swallowed some foreign substance and that they will send him to your office for examination As these cases are largely beyond where they can be seen by ordinary means as used in the office, believe it better for patient saving time and getting the case under proper conditions, to send to the hospital as in a large majority of these cases there is no great need for haste unless dyspnic and of course proper measures must be instituted at once to relieve this Rest and quiet, proper attention to water hunger and *x*-ray examination are the things the case needs

Tonsils—Repeated attacks of inflammation and often followed by rheumatic symptoms Here removal offers wonderful possible results Not so with every attack of rheumatism, here close cooperation by history and clinical course results in brilliant work for both specialists and internists It is common knowledge that some are relieved by operation, others not so Here a preliminary study by both will insure a much better result

Tonsillectomy—Whitish membrane where capsule and muscle is separated, a purely normal reaction, not pus, as often told parents by some doctors and cause needless alarm Question of diphtheria, etc

Catract—Always in the hospital for at least ten days, never any question or trouble in my experience in these cases from the general man They do not wish to dress or care for them

The man who has had one or two cases, one of the most dangerous, how far should we go with our house staff In a rotating service in a general hospital they serve several months with you as a reward for assisting you and taking care of house service, you arrange for them to do some operative work under your supervision This goes through without incident You do not mean they have acquired the knowledge that would fit them as specialist but I fear it often gives a false impression as to their ability Have seen these young men start to do operative work with no further training and while I do not wish to belittle the work I gave them feel it inadequate for them to assume the role of operative surgeon without further assistanceship or post graduate work Would it not be proper for the hospitals to soon limit the right to operate except to those they know personally, are properly qualified or who present proper credentials Believe we will soon see this as a proper check for unqualified operators

Report J P Case History—About three years ago swallowed, innocently thinking that he had taken a drink of water, a glass that contained lye It was noted he was losing weight and had great difficulty in swallowing He was seen outside and referred to the hospital The medical department had an *x*-ray as he came in on this service and as the result of the *x*-ray a stricture of the esophagus was noted, a study and examination with the esophagscope of this stricture followed and it was not considered wise to attempt any instrumentation The child's condition became grave through a lack of food and water and while the Murphy Drip was used, associated with other measures to get fluid into the body, the improvement was not marked He was referred to the surgical division and Dr J D McGarrahan did a gastrostomy By this means the child was fed and a marked improvement followed He was sent after a few weeks to Philadelphia and Doctor Tucker introduced and started to use his retrograde bougie this we have continued for two years, first twice a week, and then once a week and now has it passed every two weeks He was rather mischievous type of a boy His wound was dressed daily and on two occasions the rubber tubing that kept the wound in his stomach was missed by his nurse, this was promptly reported and on questioning we were

vate venereal disease and that it acts as a predisposing cause of epithelioma of the penis and mention only one treatment, namely, circumcision

Some time ago I read an article by a doctor in the public health service of Virginia I regret my inability to mention his name, but he stated that he believed that national circumcision would do more good to rid this country of venereal disease than all the salvarsan, mercury, or potassimum-iodide that was ever made He also believed that in time the venereal problem would be permanently settled if this little operation was routinely adopted Prof Roseneau mentions in his text book of Hygiene and Sanitation that routine circumcision is an aid to genital cleanliness and a prophylactic against Syphillis, chanroid, venereal warts, herpes, epithelioma, balanitis and phimoses as well as a deterent to masturbation In another part of his book, routine circumcision and medical examinations are mentioned as a desirable preliminary to marriage

I was very much amused while reading various articles on the subject to find one, Dr E D Morgan of Independence, Mo , who stated, "Circumcision of the infant not only contributes to cleanliness, minimizes masturbation and venereal disease, but it prolongs participation in the sexual act"

The Elective Indication

When we realize that the foregoing indications are true and a parent asks us to circumcise their baby, I am inclined to say that there is sufficient reason for the doctor to say that a circumcision should be done I believe that a parent has just as much right to say whether or not their baby should be circumcised as they have to say whether their child should part his hair in the middle or on the side

Contra-Indications

The contra-indications to the operation are inflammation or balanitis due to the ammoniacle diaper, bleeders, prematurity, anemia, general weakness, a loss or no gain in weight since birth, febrile conditions, obstinate diarrhoea, intracranial injury and diseased conditions of the skin such as impetigo, scabies and urticaria

The Objections to Circumcision

Dr Sutherland of India, says "This little mutilation is seldom necessary" He does not do the operation because First a slit under the surface of the prepuce longitudinally with subsequent stitching of the incised ends widens the tight part and thus remedys the trouble *Second* he does not believe that masturbation is in any way influenced by the operation and says that boys will be boys whether their foreskins are on or off *Third,* the operation does not protect against disease because the glands become leathery and easily develop a fissure in which the treponae may enter *Fourth,* asthetics is not in its favor or else the Greek artists would have their statutes show denuded glands *Fifth,* he states that the delicate sensibility of the parts is blunted by the results of the operation

Dr Thomas H Lannan of Boston, says that boys with a large pad of suprapubic fat rendering post operative care and cleanliness very difficult, should not be circumcised He likens the appearance of the results of such operations to a "Toad in a Hole" or an Umbilical ployp He mentions that out of 57,000 cases up to three years of age, admitted to their outpatient department, only two required operative intervention and those merely a dorsal slit From that he deducts that the operation of circumcision is practically never absolutely indicated

The Favorable Time for the Operation

It is a time-honored custom, I believe, among the Hebrews to circumcise their babies on the eighth day Dr F F Burgard of the Kings College Hospital, states, "This operation should always be done at the earliest age possible, owing to its simplicity"

Dr Lannan of Boston, believes that the ideal time is after they have ceased to wear diapers Perhaps his reason for this is because he believes a general anaesthetic is necessary

When requested, I do the operation as near as possible to the eighth day, but I first make sure that the parents understand both the objectionable as well as the beneficial results of the operation

Technic of the Operation

The fact that circumcision of the male infant is occasionally attended by conditions which are decidedly worse cosmetically and otherwise than the original condition, makes the operative procedure one of great importance Even with men of superior operative skill and perfect technic, not infrequently there is to be found a baggy flap of tissue on the under surface near the frenum Broad scars and deep fibrous tissue often mark the line of incision and occasionally so much of the skin is removed that the remaining portion is broken during erection or coitus The blood clotting time should be determined routinely on each case before the operation

I believe that an infant circumcision in order to be successful must secure five results

1 The excess preputial tissue must be removed, thereby diminishing sensibility and the area of secreting surface and smegma collections

2 It must prevent the contraction of the

INFANT CIRCUMCISION

By WILLIAM B D VAN AUKEN, M D, TROY, N Y

INFANT circumcision is the oldest and most widely spread operation known According to Herodotus it began among the ancient Arabians or Egyptians There is biblical evidence to show that the Israelites derived their knowledge of circumcision from the Egyptians

It is defined as the removal of all or part of the foreskin Hence a dorsal slit or any stretching of the foreskin cannot be classified as a circumcision operation

It is a matter of record that the females of Arabia, Egypt, Nubia as well as portions of Asia and Africa observe a custom of amputation of the prepuce of the clitoris or the labia minora Dr Belle C Eskridge of Houston, Texas, after a study of school girls over a period of 27 years, calls attention to the similarity of development and physical discomforts from adherent prepuces of those she has studied She recommends and practices the operation of circumcision of the female as a means of relieving nervousness and masturbation due to retained smegma or adherent prepuce

Nevertheless in the presentations of this subject, I shall confine myself to the indications, contra-indications, objections, the favorable time, technic and complications of the operation of circumcision of the male infant

The Indication for Circumcision

For purpose of clearness I shall describe the indications under five headings

1 *The absolute indication* according to Prof John Fraser of the University of Edinburgh, Dr F F Burgard of the Kings College Hospital, London, Prof J Lovett Morse of Harvard, and the late Prof Holdt of New York City, is when the preputial ring, i e the junction of the inner and outer folds of integument, is normally or has become pathologically so narrow and unyielding that it is impossible to withdraw it over the glands

The Religious Indication

Dr Isaac Abt of the Western Medical School of Chicago, mentions Religion as an indication We are all aware that the members of the Hebrew race practice this as a routine in infancy, with religious ceremony

The Hygienic Indication

It is my belief that the hygienic benefits to be derived from infant circumcision may likewise be derived by the complete retraction of the foreskin and by proper care and subsequent cleanliness of the part The question is, however, do those cases that we leave for the mother and later for the individual himself to care for, actually get that care which will be equivalent to circumcision? I do not believe that very many do

Dr W D Sutherland of India, argues against the commonly accepted hygienic results of circumcision by asking the question, "Which is better to remove the secretion of the glandulae odoriferae by daily ablution or to remove it by friction on the clothes?" There is not a doubt in my mind as to the answer of this question, but I wonder how many are taking their daily ablutions Very rarely we find a newborn with a foreskin that *only reaches half way over the glands penis* and in this class of patients I believe that the hygienic care given by the average individual to such an organ will be equal to that to be derived from circumcision Long prepuces always have a tendency to catch the last drop of urine and to make the trousers of the young lad moist and to give the adult a feeling of discomfort till the moisture drys

The Prophylactic Indication

Infant circumcision may be performed to prevent balanitis, Smegma retention, Phimoses, Paraphimoses, Masturbation, Nervousness, Convulsions, Epilepsy or other reflex disturbances Holdt mentions that phimoses of infancy may be so pronounced as to cause hernia or varicocele from the straining effort required for micturition

Dr Thomas A Timmons of Columbia, Tenn, at their state medical meeting in 1905, stated, "Circumcision has a splendid effect in helping to check nocturnal emissions when the prepuce is long It will stop certain forms of epilepsy (those that the prepuce itself produces) in male children, to say nothing of the chances at veneral diseases it reduces It's the thing to do whether there is a disease or not"

Dr J C DaCosta of the Jefferson Medical School, says that congenital phimoses may induce irritability of the bladder, incontinence of urine, prolapse of the rectum and various nerve symptoms and believes that the treatment is circumcision Rose and Charless state the congenital phimoses may be so pronounced as to occasionally prevent micturition or there being such a tiny opening that it causes irritability of the bladder from obstruction They state that definite concretions may be formed from the retention of the inspissated smegma Distention of the bladder and even hydronephrosis may supervene in neglected cases They further add that it is certain to aggre-

Read at the meetings of the Rensselaer County Medical Society in April 1928 and The Medical Society of Bay Ridge Brooklyn in October 1928

rect the error The area from which the skin is displaced is allowed to granulate

5 Oedema of the parts on the second or third day is generally due to rough handling and subsides after a few days

6 Other less frequent complications are Inflammation, Suppuration, diphtheria, erysipelus and gangrene from too tight a bandage These conditions are treated the same as they would be at other points of the body

Summary

Infant circumcision is over 5,000 years old, but in spite of that fact one often sees a circumcision which has not been done properly

There is only one positive indication for the operation, namely Any narrowing of the prepuce which absolutely prevents complete retraction

It is alleged to be indicated for Religious, Hygienic and Prophylactic reasons

It is contra-indicated on all babies showing a lack of normal healthy development and on "Bleeders"

The operation is objected to by a great many doctors for various reasons, but chiefly because of the loss of the natural protective covering of the glands penis, and because it is alleged that all of the advantages of circumcision can be obtained by complete retraction and daily cleanliness

I believe that the best time to do the operation is on the eighth day of the infant's life

The simplest and most desirable operative procedure for the attainment of the results desired is the double flap operation

The complications of the operation are Hemorrhage, Meatal ulcer, Secondary phimoses, Para-phimoses, Oedema, infection and gangrene

Conclusions

Infant circumcision as a routine procedure is not recommended by very many of the doctors of English-speaking countries Most of those who recommend it as a routine are men particularly interested in public health It would be very interesting to have some reliable statistics on the relative frequency of venereal disease among the circumcised and uncircumcised males

Parents have the right to ask their obstetrician to circumcise their offspring and the operator should be sufficiently versed on the subject to talk intelligently on the pros and cons of the operation He should also be sufficiently skillful with the operation to do it properly, or if not he should leave it for some one else to do Every operator should realize the results to be obtained by the operation and should strive to prevent the undesirable complications or sequelae that are too often prone to follow infant circumcision

LABORATORY CONTROL OF MILK UNDER THE NEW STATE CODE*

By MORRIS MASLON, M D, GLEN FALLS, N Y

I PRESUME you all are, or at least most of you must be familiar with chapter three, as amended May 6th and December 14th, 1927 of the Sanitary Code, which goes into effect July 1, 1928

May I call your attention to a few of the important changes, from a laboratory standpoint as noted by me

First, It is made mandatory for the local health officer to have bacterial counts made by an approved laboratory before he can issue a permit to a dealer to sell milk or cream This, as I interpret it, creates no added financial burden on the dealer

Regulation 5 says "He shall cause to be taken samples of such milk and cream, and shall cause bacterial counts to be made for the purpose of grading and determining whether the condition of such milk and cream is such as to be in compliance with the requirements of this chapter A bacterial count to be used for the purpose of grading, shall consist of the average of successive counts made by the standard agar plate method, upon not less than three samples of milk or cream, each sample to be taken on a different day Such bacterial counts to be so used, shall be made only in laboratories approved for such purpose by the State Commissioner of Health Thereafter, at intervals of not more than three months, samples shall be taken and bacterial counts made The standard direct microscopic method may be substituted for the standard agar plate method in the grading of milk which has not been pasteurized

Regulation 4 of the supplementary rules and regulations to Chapter Three of the State Sanitary Code (Milk and Cream) says "The terms standard agar plate method and the direct microscopic method means the method as contained in the Standard Methods of Milk Analysis of the American Public Health Association, latest edition

Lack of time will not permit me to go into detail just what all of these standard methods require of us laboratory men, but because of

*Read at the annual meeting of the Medical Society of the State of New York, at Albany N Y May 23 1928.

scar with the resultant phimoses or paraphimoses

3 It must prevent readhesion of the inner fold of the prepuce to the corona during the healing period

4 The work must be rapid with a minimum amount of traction or other trauma so that it can be justly said that no anaesthesia is needed or if one is used that it be the briefest possible

5 It must be capable of being performed without the necessity of an operative assistant.

The type of operation which I have found most satisfactory is the double flap operation which I will now describe

The articles used are as follows

A plain towel and one with a central hole large enough for the penis to pass

Six small gauze sponges, a piece of one-inch bandage 8 inches long, with its mesh well impregnated with sterile vaseline One tube of 00 plain catgut. One small skin cutting curved needle A pair of curved scissors A short probe A pair of small thumb forceps and a needle holder

Technic The nurse prepares the parts by thorough cleansing with soap and water and a subsequent wash with alcohol immediately before the operation Then the circumcision towel is placed over the penis and the mosquito clamps are placed about one-sixth of an inch apart on the mid dorsal line of the prepuce, being careful to take so small a bite that the infant will not suffer pain The probe loosens all adhesions down to the corona Then while the forceps are held well forward the foreskin is slit up the middle line back to, but never past the corona This cut should be accomplished with a single closure of the scissors The two preputial flaps are now reflected

All adhesions and smegma are removed and sufficient redundant tissue with the curved scissors to expose the glands and at the same time leave just enough to cover the corona so as to prevent undue irritation As the scissors pass around the dorsum to the frenum they approach the frenular arteries and if the prepuce is not too long it is wise to terminate the incision on the free margins just before reaching the frenular arteries Sutures in the vicinity of the frenum frequently cause considerable swelling and irritation Four or five interrupted sutures then approximate the folds of integument and the operation is complete Continuous suture is never used as it has a tendency to cause constriction I have read of one operator who uses that type of suture, but I believe that his sutures were sub-cuticular and inserted loose

For the first twenty-four hours, I use gauze well impregnated with vaseline as a post operative dressing After the first day the nurse is instructed to bath the parts with boric acid and after dry to dust with bismuth formic iodide or stearate of zinc powder She is told to watch frequently for bleeding during the first twelve hours

The entire operation seldom takes more than fifteen minutes and occasionally by using the sugar nipple, we hear little or no crying except when the adhesions are removed I have tried giving the babies ether but am convinced that the discomfort and crying from the ether is worse than the operation itself

The Complications of the Operation

1 Hemorrhage is usually due to improper tieing of the cut surface or very rarely to "Bleeders" If it is impossible to stop it by using local styptics, it is necessary to expose the wound and suture the bleeding area or transfuse

2 Meatal ulcer is caused by retention of the urine in the meatus with decomposition and subequent irritation also by the absence of the protecting prepuce, which condition further devitalizes the part and permits slight trauma especially when the old-time tight triangular diaper is used Dr Joseph Brennemann of Chicago, presented a comprehensive paper on this subject before the American Pediatric Society in May, 1920 He believes that the ulcer always is due to the ammoniacle diaper and further states that it almost never occurs in infancy being most commonly found soon after the first year He treats the condition dietically and by thorough rinsing and boiling of the diapers, night clothes and bedding due to the possible alkali or certain bacteria as etiological factors The sore should be kept as dry as possible and a small quantity of adrenalin or cocaine and zinc ointment should be applied

3 Secondary Phimoses is a complication due to insufficient skin being removed It is certainly a very embarrassing complication I will assure you, inasmuch as I had the undesirable experience of trying to handle such a case which I operated in the early days of my general practice I must add that the treatment is usually given by the next physician at your expense

4 Contraction of the skin and mucous membrane at the corona due to the removal of too much tissue Prof John Fraser describes the treatment of this annoying condition He says that this area being under considerable tension is liable to remain persistently irritated or even ulcerated The only way to correct the condition is by making a circular incision around the penis which only passes through the skin A cuff of skin is thus mobilized which can be slipped downwards so as to cor-

ORGANIZED MEDICINE ON LONG ISLAND

Five addresses before the Second District Branch of the Medical Society of the State of New York, December 6, 1928

KINGS COUNTY

By CHARLES H GOODRICH, M D, BROOKLYN, N Y

IT MAY be trite to repeat the words of my predecessor in the presidential chair of the Medical Society of the County of Kings, and yet it is true in reviewing the work in Kings County since the last meeting of the Second District Branch to say "that the year shows progress in the same general lines of community activity and professional work"

Our cooperative community activities are based upon participation rather than mere endorsement or approval of some other organization's work We have maintained reasonably close contact with the Department of Public Health, with the various health and welfare agencies, with the Visiting Nurse Association, to which organization we act as Medical Advisory Board, with the Nurse Official Registry, on whose governing board the County Society has representation, and have continued to maintain our efforts, in regard to illegal practice, to make the Webb-Loomis Bill work, to provide popular talks to lay audiences, and to make our own professional activities increasingly more effective

Analysis of our Society meetings show that at the stated meetings 29 papers were read by nine members of the Society and 20 visitors, 23 papers covered scientific topics and six papers covered health and general topics

In addition, three extra or special meetings were held in the Society building devoted to "Socialization and Paternalism in Medical Practice" (Fishbein), "Syphilis of the Viscera" (Prof Franz M Groedel of Bad Neuheim), "Medical Journalism" (Sir Squire Sprigge, Thur S Welton and Lewis S Pilcher)

In the field of popular education we have given, or assisted in arranging for, some fifty lectures

One staff conference of the Visiting Nurse Association has been held in our auditorium and addressed by members of the Society One staff conference of the teachers of the Home Making Division of the Board of Education has been held in our building and the work of the County Society explained

Our Friday Practical Lecture Series has continued as in the past with large audiences and the interest maintained

Graduate Education as conducted during the past six years still continues

The Society has acquired property which in addition to the actual library building, gives us the corner plotage of Bedford and Atlantic Avenues, which will enable us to expand if and when the necessary financial arrangements are made

---

QUEENS COUNTY

By E A. FLEMMING, M D, RICHMOND HILL, N Y

Under the farseeing and effective leadership of Dr Francis G Riley, of Jamaica, as President, we have rounded out a successful year in 1928 In the brief time allotted we desire to refer to some of our activities in Queens under the following headings

1 Society membership and meetings
2 Society finance
3 Medical economics
4 Publicity
5 Public health matters
6 Graduate education
7 Our new society home

During 1928 our society's roster has increased 16½ per cent The average attendance at a stated meeting in the same period of time has been increased five per cent There has been a notable increase in interest at our stated meetings and more men are taking part in the discussions

In the spring of this year we revised our constitution and by-laws In so doing, we incorporated our financial activities on a budget basis In this matter we had the wholehearted cooperation of our able treasurer, Dr James Dobbin This budget basis has begun to produce results We have learned not only how we can better spend our money, but how we can save it, a much harder lesson, for either an individual or a society to learn This system is giving us a better insight into what activities are really paying us, not in a matter of dollars and cents alone, but on the basis of scientific results attained per dollar invested We feel assured it will help us to cut out some of our fruitless activities and leave us with

its direct bearing on regulation five, I will call your attention to only one of its many important items Because we know that the bacteria present in the milk are found in clumps, standard methods require us to shake the milk specimen twenty-five times before taking the required amount for the first dilution bottle from which plate cultures will be made We are endeavoring by this procedure to break up the clumps of the bacteria present in the milk and thus obtain a fair count for the dealer and consumer

Standard Methods also establish uniformity in technical methods, apparatus and, culture media used, length of incubation period, and method of colony counting One can easily visualize the serious discrepancies which would arise if different laboratories doing milk work would each use different methods Some time ago a series of experiments was done along these lines with very interesting results

To my mind, one of the most important points of regulation 5, more important by far to the dealer than to the consumer, is the requirement which says that the final bacteria count on which the grading of the milk is made shall be the average of three bacterial counts, each individual count obtained from a different sample of the milk taken on three different days Heretofore Health Officers could grade the milk on any one bacteria count From many years experience in laboratory, and Board of Health work, I cannot condemn this method too strongly Knowing the many opportunities for error in doing efficient milk counts, the many technical breaks which can easily be made unintentionally, each break which may result in an unfair bacteria count, I have always contended, in our local health work, that it was most unfair to the milk dealer to grade his milk bacteriologically upon the result of one bacteria count. The authors of this particular regulation in the new code are to be congratulated on their work. If this particular requirement, and the many other excellent provisions found in the new code for the protection of the milk producer could be brought to their attention, I am sure the many criticisms and dissatisfactions which we read about from the producers, would be done away with These provisions prove to me the intent of the State Health authorities to be as fair with the milk producers as they can possibly be and at the same time adequately protect the milk using public

Two methods of the laboratory control of the milk supply are permitted

A—The standard plate count

B—The direct microscopic count.

The first is the most popular, the longest in use, the most frequently used, and is applicable to all milk samples, that is, both raw and pasteurized The latter is one which has come in use within the present years, is very simple and time saving, and is a very valuable method, but can only be used for raw milk

We laboratory workers must remember that the code calls for the following grades of milk

Pasteurized Grade A	Final	count	not	more	than	30,000	colonies
Certified	"	"	"	"	"	10,000	"
Pasteurized Grade B	"	"	"	"	"	50,000	"
Raw Grade A	"	"	"	"	"	30,000	"
Raw Grade B	"	"	"	"	"	30,000	"

The bacterial content of cream calls for a final count of not more than 500,000 colonies per c c I am sure all health officers and laboratory workers will agree the above counts are not excessive, and one that can easily be lived up to by any careful and conscientious milk dealer

The bacteriological examination of the milk is of the greatest assistance to the health officer in enforcing the milk code It gives him a clew as to the age, temperature, and the cleanliness of the milk A high bacteria count in a milk specimen can mean only one or all of three facts, namely, warm milk, dirty milk, or old milk, none of which is desirable from a public health standpoint As was pointed out a long time ago by Doctor M J Roseneau, the bacteria count serves also to confirm conclusions arrived at by the health officer on his inspections of dairies It provides him with a cheap, and ready method of determining the general sanitary quality of the milk supply of a community And in conclusion, be sure the milk specimens are brought to the laboratory properly iced

NASSAU COUNTY

By A. D JAQUES, M D., LYNBROOK, N Y

In reporting the activities of the Medical Society of the County of Nassau for the year 1928, it is necessary to resort to a hackneyed expression and report "progress," for the reason that most of our accomplishments for the year are in the nature of progress toward an ultimate goal rather than an actual accomplishment of the end in sight There are, however, a few projects which might be considered as closed or brought to a sufficient state of completion to justify calling them accomplished

In December of 1927, we instituted the publication of a monthly bulletin Since that time, through the cooperation of the Nassau County Committee on Tuberculosis and Public Health, we have increased our circulation to include approximately 1250 lay residents of the county and have added to the scope of the publication so that it now bids fair to become a definite factor in the fields of public health and preventive medicine in the county It is our intention to still further increase the size and circulation of the publication during the coming year, and we confidently expect that within a few months we shall have a medium for the distribution of the announcements of our committee on Public Health Instruction and Publicity which will very much justify our effort

In the field of Post Graduate Education, we have continued our successful activity of last year and during the winter months of 1927-28 we conducted twenty afternoon lectures which were uniformly well attended and of high professional standards Encouraged by this success, we started our program for this season during the early part of November and will hold a total of six lectures before the first of the year so that our complete program will probably include between 25 and 30 meetings

Committees appointed for the purpose have done considerable preliminary work which indicates the ultimate and imminent success of our program to secure for the County a central laboratory and a county hospital for the care of acute communicable, chronic and indigent cases To this end, the hospital survey made by the Society in 1923, is being revised The Society has been much gratified within the past few months to witness the opening of hospitals in Glen Cove and Rockville Center, both by private subscription, both erected at points recommended by this Society in its original survey, and both made possible, at least in part, by the use for propoganda purposes of our published report of the survey

We hope that by securing the county hospital we shall also solve the problem of our patient and venereal clinics We are keenly aware of the handicap to the county by the non-existence of any agencies for carrying on these two important public health activities We also hope through the same source, to be able to do considerably more work in the way of well children's and pre-natal clinics

In general, we can make the definite statement that the Medical Society of the County of Nassau is assuming its rightful place as a dominating factor in the fields of public health and preventive medicine, lay groups and organizations are recognizing this fact and are turning to us with increasing frequency for advice, and we confidently expect that within a very short time, we can be certain that no project in either of these fields will be undertaken by any group without the Medical Society having guided and participated in the preparation and the execution of the plans

The activities of the Society have increased in variety and size to the point where it has become necessary for us to choose between the alternative of limiting them or providing the material facilities to carry them on to a larger end

We are happy to report that we chose the forward step rather than the backward, and we have opened executive offices, centrally located in Mineola, and engaged the full time services of the necessary executive and clerical assistants This involves a serious problem of finance when it is remembered that our total roster includes but 156 names To solve this problem of financial support, we are organizing a business bureau supported by stock subscriptions and fees, and we were most gratified to enroll for purposes of organization, in excess of 50 per cent of the membership of our society, and have the pledge of sufficient funds to assure the new bureau at least a year in which to find itself financially Aside from financial considerations, its success is already apparent as witnessed by the immediate increase in the calls made upon the society for legitimate public health information and service

We hope that in time this business venture will enable us to emulate the Queens County Society and secure our own permanent home

Among the proposed activities of the new bureau are the cooperative exchange of credit information and the collection of delinquent accounts We are also planning to supervise and coordinate the activities of the several nurses' registries in the county, with the ultimate aim of providing the Society with a mechanism for a disciplinary supervision of personnel and the more flexible listing of available

more money to spend in broadening our field of endeavor Without seeming to give gratuitous advice we would recommend it as a progressive measure, worthy of adoption in any County Society

Another outcome of the revision of our constitution was the birth of a new committee, new at least to our society, the Committee on Medical Economics One of the first things this committee did for us was to start a course in public speaking for the members of our society This course was limited to forty men, and the limit was quickly reached Its sessions were held weekly, were well attended though they ran over a period of several months The men who took part in them felt they had gotten a something from their county society that they had long desired The net result was so satisfactory that we are considering the formation of a similar class, in the year 1928

Undr the meticulous care and literary skill of our Secretary, Dr E E Smith, who is also the Chairman of the Committee on Publicity, the Bulletin, our official mouth-piece, has been increased in size and improved in the quality of its "copy" Under the same guidance this publication has been made to stand upon its own legs financially This committee proposes to sell the County Medical Society to the laity by means of a newspaper campaign, using such topics as the periodic health examination and the examination of the child of the pre-school age as a basis for such propaganda You will probably see and hear more of this movement at a later date

Our Public Health and Public Relations Committee has done three good things for us this year First—it has, through its members, pushed a campaign, for a County Hospital which we need very badly in Queens Its propaganda has gone out to some sixty-five lay, health and civic organizations, stimulating them to cooperate in this splendid movement The matter to date has reached the Board of Estimate of the City of New York and we are looking forward to tangible results in the near future Secondly—this committee advocated throughout our county a movement for the health examination of the pre-school child by its family physician In this matter its efforts were ably seconded among the laity by the cordial cooperation and energetic work of the Queensboro Tuberculosis and Health Association Thirdly—in conjunction with the Medical Economics Committee, our Public Health Committee organized a speakers' bureau to provide speakers from our County Medical Society for lay health organizations, civic bodies, Parent-Teachers associations, whenever, and wherever such speakers were desired to discuss matters of public health within the borders of our borough We desire here also to publicly acknowledge the aid of the Queensboro Tuberculosis and Health Association in this matter We feel these measures by our Public Health Committee, has served to elevate our county society to a commanding position in public health matters in our county A position which we have long neglected much to our chagrin

Our Committee on Graduate Medical Education has provided during 1928 twenty-seven Friday afternoon talks In addition it has inaugurated six courses on subjects in the field of Graduate Education A notable element in this field of work this year has been the increased capital cost, due to small attendance, in spite of timely topics and good speakers This spirit of lack of interest and apathy we have not met before in any great degree Is this situation unique in Queens This for us—is the question that surges to the front when we discuss Graduate Medical Education

The capstone of our endeavors for 1928 has been the consummation of a drive, for a new and permanent home for our society on one of the main thoroughfares of our Borough This movement was started by our Board of Trustees, as far back as 1923—by the purchase of a plot of ground 200 x 100 on Queens Boulevard Under the efficient leadership of Thomas C Chalmers, Chairman of our Board of Trustees, a drive for two hundred and fifty thousand dollars for our home, which began last February, is rapidly drawing to a close We will have in this building an auditorium which will seat at least three hundred and fifty to four hundred persons We will have at least two section rooms, that will accommodate one hundred and fifty each There will be office room for allied public health organizations like the Red Cross and the Metropolitan Nurses Association, etc Within the walls of our new home, our members will find offices for private physicians, a surgical supply store, a twenty-four hour telephone service and many other features which we feel the field in Queens is ripe for The heart of our home will be our Medical Library The aim of our Board of Trustees will be to bring this library to a place that will make it compare in time, favorably, we hope with your library here in Kings

We feel that we are near the point when we can give our chosen profession proper and dignified surroundings, and that all the time, energy and labor we have expended in this direction, will come back to us ten-fold in an unfailing dividend over the years to come by raising higher, the standard of the practice of medicine in Queens

about public health affairs and became involved in a bitter controversy when they asserted their independent judgment regarding the administration of the county health department The State Committee is now available at any time for advice and assistance to any county society on any subject involving the relations of physicians to other health agencies Already the State Committee had given advice to a county society in which the State Department of Health had instituted a survey of crippled children for the purpose of securing accurate data on which to found state-wide legislation The members of the County Society were uncertain of the objects of the survey and were inclined to resent the coming of investigators without previous consultation and investigation The State Committee on Public Relations recognized the justice of the contention of the members of the County Society, but it also informed the County Society that the oversight of the State Department of Health was a small matter compared with its good intentions The State Committee advised the County Society to cooperate fully with the State Health Department so that the data secured would be reliable, and the legislation should be acceptable to the physicians

The programs of the Second District Branch for the last two years have been unique in that they have emphasized the activities of the component county societies The State Committee on Public Relations had sent representatives to all the other District Branch meetings, but they occupied subordinate places on the proceedings The plan of the program of the Second District Branch is recommended to the other Branches

THE RELATIONS OF ORGANIZED MEDICINE TO PUBLIC HEALTH

By LOUIS I HARRIS, M D, NEW YORK N Y

Abstract of an address before the Second District Branch of the Medical Society of the State of New York in Brooklyn on December 5, 1928

YOUR chairman has introduced me as a specialist in the practice of civic medicine alluding, no doubt, to my years of service in the Department of Health of the City of New York in which the practice of civic medicine is the predominating activity It is unfortunate that the practice of civic medicine in public health service is not rewarded as adequately as that practice deserves Perhaps it is because physicians as a professional group have not shown that deep concern for this specialty which would invite a reasonably adequate financial reward However, they are now beginning to recognize their responsibilities and duties in civic medicine, and with their increasing participation in public health medicine they may enhance its influence and accomplishments

Public health practice should not be the Cinderella of medicine, an afterthought of uplifting reformers It is the peculiar concern of organized medicine The medical societies give concrete embodiment to that vague conception called "organized medicine" which has been more potent in name than in action The representatives of the medical societies should be the counsellors and aids of Departments of Health in organizing public health programs—at least they have been in New York City in recent years

But advance in public health depends on an intelligent public quite as much as on interested medical societies Voluntary health associations are springing up by the hundreds—in fact there are now three thousand tuberculosis and public health associations in the United States They have certain definite rights and functions The Committee on Public Relations of the Medical Society of the State of New York is formed in order to harness and tie this force up with the desires and functions of the medical profession While doctors frequently are civic minded, yet as a group they will always show apathy until they are directed and encouraged by some higher source of inspiration into specific channels and method of civic service such as the Public Relations Committee of the State Society There is need that doctors form an alliance with voluntary health organizations so that physicians who have certain definite rights as well as obligations shall not be relegated to play an insignificant role or be pushed off the stage entirely The practice of medicine has not only a scientific aspect, but also a social side which doctors have just barely entered upon Take the cancer campaign for example It would seem that this is peculiarly a medical problem and yet some of the most active leaders in the field of preventive service that we aim to accomplish through public education is performed not by doctors but by laymen It is non-medical leaders who promulgate their views on various scientific developments and as to diagnostic criteria, the hunger for finances to indulge the modern craze for publicity has led to an unfortunate competition with the Tuberculosis Health Association in a special seal sale Why cannot physicians go to men of wealth and secure funds with which to conduct a cancer campaign managed with dignity and scientific accuracy and without ballyhoo, by organizations of physicians, as an evidence of an interest that is not merely academic? It would seem feasible that the Committee on Public Relations, for example, could secure an endowment with which it could carry

nurses on a county-wide basis At present it is not uncommon for a shortage of nurses to exist in one section of the county while a registry located in another geographical section might at the same time have on call nurses who are most eager for engagement Likewise, it is not at all uncommon for a doctor to find on his case a strange nurse with no recommendation other than that of her state registration card, which unfortunately does not carry with it any guarantee of her personal qualifications

Further activities planned for the business bureau will include the purchase and exchange of apparatus and supplies, and provision is being made for accounting service which eventually will include the preparation of income tax reports, the mailing of bills and the auditing of members accounts

Meanwhile, with all of these activities, we have by no means neglected our scientific duties and privileges During the past year we have conducted nine regular meetings at which one and occasionally two scientific papers were read by men of distinction and ability Evidence of the interest taken in these scientific sessions can be found in the fact that within the past five years our membership has increased from 85 to 156 with several applications pending, and the further fact that the average attendance at meetings has increased from 15 to 20 to 50 or 60, with at least two meetings at which the attendance considerably exceeded this figure Our membership gain for the past year was very slight due to the unusually high loss we have sustained during the year by reason of death, removal and retirement No members have been dropped for two years because of non-payment of dues

In conclusion, we wish to report to the Second District Branch that the Medical Society of the County of Nassau is in a very healthy and thriving condition, and that without neglecting in the least the scientific aims of our organization we have been able to increase our activities to the point where their scope and value is quite beyond that of the average small rural or semi-urban medical organization

---

SUFFOLK COUNTY MEDICAL SOCIETY IN 1928

By WILLIAM H ROSS, M D, BRENTWOOD, N Y

THE outstanding accomplishment of the Suffolk County Medical Society during the year 1928, was the securing of the establishment of a County Health Department under the provisions of 21-b of the Public Health Law This is the second county to establish a health department, and the first to accomplish it as the result of a spontaneous movement of the physicians of the county The campaign was begun two years ago by the passage of a formal resolution by the County Medical Society The campaign was conducted on a high plane, principally by means of articles in the *Monthly News Letter* which is published by the county society and is copied widely in the newspapers of the county The movement was endorsed by the health officers and by the Suffolk County Tuberculosis and Public Health Association, and many civic organizations The only assistance received from outside the county was that of the State Department of Health under whose supervision the county department will be The personnel of the County Board of Health is entirely satisfactory to the physicians, and three of the members were nominated by the county society The Board has held three meetings and has appointed Dr Frank Overton as acting health officer to hold office until the full-time appointee, Dr Arthur T Davis, Health Commissioner of the State of Delaware, can assume the office, which will be about the first week in January

The Board plans to work in full cooperation with the physicians of the county, and so far as possible, to have the health officer conduct his office as if he were the executive officer of the County Medical Society

As secretary of the Committee on Public Relations of the Medical Society of the State of New York, I am expected to use the accomplishment of Suffolk County as an illustration of the medical leadership which the Committee wishes the members of the medical societies of other counties to assume The two years' campaign for the establishment of a county health department in Suffolk County was preceded by several years of a growth in leadership The Committee on Public Relations does not expect a wave of emotional excitement to sweep through the county societies leading them to assume impractical activities The work must be an evolution for which preparation must be made Neither will the establishment of county health departments be the sole or even the principal object of the Committee on Public Relations The first work of the committee is to inspire each county to make a survey of the needs for medical service and public health work The next step will be that each county will develop a plan suited to itself

The State Committee on Public Relations was formed as the result of the experience of the medical profession of Cattaraugus County where the local physicians had little to say

TECHNICAL WORDS IN POPULAR MEDICAL TALKS

Doctors are often accused of using technical terms in popular medical talks Examples are the technical expressions used by physicians on the witness stand of law courts As a matter of fact, carpenters and dressmakers use technical terms to a greater extent than doctors, and workers in every trade and profession are prone to use the technical terms of their crafts when they talk to those outside of their own guilds

A well-defined branch of medical literature is that of popular health talks The most effective writers in this field are those who translate the technical language of doctors into colloquial speech

on its work in a broadening field of civic medicine

However, the following suggestion deserves special consideration When doctors go before legislative committees, the advocates of the many cults that are either opposed to medicine or that would become practitioners without the benefit of education declaim that physicians are mercenary and are seeking special privileges because they fear competition Doctors may grow apoplectic in trying to stop quacks from practicing medicine on a people that are asleep, but how about arousing the editors, the preachers, the lawyers, the educators, the engineers and others of our educated citizenry who are mentally sound, and galvanizing them to action in their own protection in health matters This has been the policy of the Committee on Legislation of the State Medical Society, but the inspiration and counselling of these groups must be continuous throughout the year Doctors burden themselves with restrictions that make it hard for anyone to qualify as a physician This is as it should be But the public put up with uneducated quacks Physicians can point out the problem and leave it to the laymen to protect themselves All this calls for partnership of doctors with the public, through the press, the lecture platform, and all other means of public information Organized medicine should make the public realize that the medical profession is alive to its civic duty

When preventive medicine is mentioned to the ordinary layman, does he think of the medical profession? Rather, he thinks of some lay organization that has gained public notice by extensive advertising Probably the health organization that is best known to the public is the Life Extension Institute because of its extensive campaign of advertising Then there are the publicity enterprises of health demonstrations The result is that people generally go to the lay rather than to medical organizations for leadership in furthering preventive medicine

A unique opportunity in preventive medicine is offered to the physicians through the examination of the four million children of New York State, and in the correction of their defects at a time when the conditions are remediable. Compared with the benefits deriving from preventive work among children, that among adults is indeed small The examinations have been made to some extent by Departments of Health and of Education—but the field belongs in large part to private doctors Are they meeting their obligations? The initiative in this field belongs to County Medical Societies to stimulate the members to take a personal interest in the health of the children of the families of their patients The examinations must be thorough and the follow-up work must be guided by conscience and good sense

The avowed justification of demonstrations conducted by endowed lay societies is that they arouse the people to consult their family doctors, but physicians have sometimes found them to be competitors A tendency of the lay organizations is to establish clinics without previously taking into account the medical organizations, and to continue the demonstrations after the need for them has passed The plans of the demonstrations have usually sprung full grown from the brains of "experts," and their promoters have every incentive to conduct propaganda on their favorable side only, for imposing statistical compilations are the magnets which continue the endowments Where do the local doctors appear in the demonstrations? The success of the lay organizations is an indication of even greater success which would follow the entrance of physicians and their medical societies into the field of genuine public service.

Physicians in private practice must recognize the peculiar field of usefulness of public health workers outside of their own ranks Physicians must also recognize their duty and responsibility to cooperate with Departments of Health and lay organizations The Department of Health of New York City, for example, has held conferences with the presidents of the five county medical societies on practical methods of controlling diphtheria and other contagious diseases and on other matters of mutual concern Yet surgeons and other specialists frequently declare without hesitation that they have no interest in public health The apathy of the physicians is reflected in the attitude of office holders For example, the Board of the City Record cut the circulation of the Bulletin of the Department of Health of New York City to 5,000 copies because only a few doctors wrote to the department asking that the Bulletin be sent to them

Physicians are touching only the fringe of their duties and opportunities in civic medicine, but a very great step has been taken in surveying the field and diagnosing the conditions—and when a diagnosis has been made, effective correction should be applied The Medical Society of the State of New York, of which this Second District Branch is an integral part, has diagnosed the situation correctly, and has initiated a public health survey of every county, with the intention of stimulating the physicians to assume a definite place in leadership in those forms of preventive medicine which meet the peculiar needs of that community

MEMORIAL—DR LUCIEN HOWE

Dr Lucien Howe, who had practiced ophthalmology in Buffalo for fifty years, died in Boston on December 27, 1928, aged 80 years He had held the chair of ophthalmology in Buffalo University, and was ophthalmic surgeon to the Buffalo General Hospital, and the Eye and Ear Infirmary

The National Committee for the Prevention of Blindness in 1917 awarded him the Leslie Dana Gold Medal for the best work during the year for the conservation of vision

It was through his efforts that the first law was passed in New York State in 1890, seeking to control sore eyes in babies—a law which has since been passed by almost every state in the Union

About two years ago Dr Howe presented Harvard University with $250,000 to endow a laboratory for special research At the same time he moved to Boston in order to be Director of the laboratory

Dr Howe was deeply interested in the Medical Society of the State of New York, and in 1906 he presented $1,500 to the Society to found the Lucien Howe Prize Fund "For the best original contribution to our knowledge of some branch of surgery, preferably Ophthalmology" The last recipient of this prize was Dr Arthur J Bedell, of Albany, whose winning article "Photographs of the Fundus Oculi" was published in the September 1, 1927, issue of this JOURNAL

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

The Business Side of Medicine—The first article of this JOURNAL of January, 1904, is the following editorial on the money side of the practice of medicine.

"Physicians as a class must in the future be more business-like in their method of dealing with the public than has heretofore been the case, if they are to be fairly successful from a worldly point of view, and able to support their families and themselves in reasonable comfort, making proper provision for their old age and for those dependent on them

"While we hope that physicians, individually and as a class, will continue always to make the welfare of their fellow-beings the chief object of their professional life, and that they will never willingly place in advance of this the desire to make money, we do hope that better business methods in professional circles will soon be recognized as necessary and proper

"Those engaged in commercial pursuits rightly consider that a business is only properly conducted when it pays its expenses and leaves a reasonable profit to those who have invested their capital in it, hence physicians, individually and collectively, must come to recognize the lack of wisdom in freely giving their time to individuals, institutions and communities who are able to pay for such services, but who are unwilling at the present time, for some reason or other, to do so

"Physicians in estimating the money value of their services should take into consideration the daily and yearly cost of living, to which must be added the interest on the money invested in their education, plus the value of the experience gained year by year in the practice of their profession, and the moral and legal responsibilities involved in the services rendered

"Too much stress cannot be laid on the importance of keeping proper accounts and rendering bills to all patients at short and regular intervals and the sooner these things are generally recognized by the members of the profession the better it will be for all concerned"

THE COUNTY MEDICAL SOCIETY IN THE CORRECTION OF PHYSICAL DEFECTS OF SCHOOL CHILDREN

The Committee on Public Health of the Saratoga County Medical Society has demonstrated a practical method by which the physicians of a county may promote efficiency in the correction of physical defects of school children The report of the Chairman of the Committee on Public Health, Dr J R MacElroy, which is printed on page 104 of this issue of the JOURNAL, describes a survey of the school children of Saratoga County made by members of the committee Not only did the committee discover the defects that needed correction, but it suggested a method by which the correction could be secured It recognized the fact that whatever the method of cure, the corrective means must be applied to each individual child by an individual doctor.

The question frequently arises, "Why don't the doctors attend to the correction of defects of the children of a community?" One great reason is a physician does not feel a personal responsibility for those to whom he is not the family physician People assume that every family has its own physician—which is by no means true Probably only ten per cent of the families claim a doctor as the family physician who is called for every condition of health, and whose advice is accepted However, the failure of nine-tenths of the families who have family doctors does not excuse the medical profession for neglecting to devise means for bringing to that group the service which family doctors give to the minority ten per cent of the population Everybody knows that physical defects are extremely prevalent, and everybody also expects the doctors to suggest the means for their discovery and correction This is what the Saratoga County Medical Society has done, by taking the first step toward the double ideal—(1) that every family shall have a family doctor, and (2) that every doctor shall give heed to the physical defects of the families to which he is called

Another reason for the failure of doctors to make a general practice of correcting the defects of children is that it has not yet become the custom or style of the people to seek or expect the corrections Who can set the style better than the practicing physicians of the county? One great benefit of the survey in Saratoga County is that it will popularize the examinations of the children When teachers and parents realize that the examinations have been made with care and precision, and further, when they have the ready means of correction offered to them, then there will be an acceptance of the services offered, followed later by a general demand for the corrections

The physicians of Saratoga County have done well in the first part of the correction of defects—that of their discovery and diagnosis The law provides that every school district shall employ a doctor for the purpose of detecting the defects of the pupils When the Saratoga Medical Society made the survey, it used the means already at hand, but its peculiar contribution was that of collecting and tabulating the data obtained from the examiners It has made a great difference to the examiners whether their reports were to be filed away never to be seen again, or were to be studied by a committee of their Medical Society, and made the basis for correction of the defects in the future There is no doubt but that under this stimulus the school physicians have made the best possible examinations

The Saratoga County Medical Society went further than discovering and diagnosing defects, they devised a practical means for securing their correction They might have established a School Hygiene District under provisions of section 577-b of the Education Law, but they chose the simpler method of asking the Board of Supervisors to provide four public health nurses under the provisions of Section 44-a of the County Law The duty of the nurses would be to assist the examining physicians, to keep the records of the children, and to assist the parents to secure the correction of the defects

The actual correction of the defects would necessarily be done by physicians The committee of the Medical Society offered the voluntary assistance of the physicians for the present at least

The physicians have the support of prominent office holders and civic organizations in their request to the Board of Supervisors for an appropriation of $25,000 00 to secure the correction of the physical defects of school children on a county-wide basis, and they have set an example of liberality and generosity by volunteering their personal services if the means of making these services available are supplied by the business men and officers of the county

The action of the Saratoga County Medical Society is tangible evidence of the increasing participation of the physicians of New York State in civic affairs under the leadership and stimulation of the State Committee on Public Relations It is a demonstration of practical cooperation among the trinity of essential health organizations,—medical societies, official governmental agencies, and civic associations

ed best to massage The chief emphasis is laid on the fact that patients in a desperate condition could be made to respond to massage and could dispense with medicinal treatment—*Klinische Wochenschrift*, November 25, 1928

Neurogenic Disorders of the Heart.—Ernst B Boas, writing in the *American Journal of the Medical Sciences*, December, 1928, clxxvi, 6, describes the mechanisms underlying neurogenic disorders of the heart and classifies these disorders under the following headings (A) Disorders of the nervous structures in end-organs of the ganglionic arc, of the segmental arc, of the hypothalamic arc, (B) disorders due to excessive or exaggerated afferent stimuli, (C) disorders due to increased irritability of the visceral nervous system of unknown localization, (D) disorders secondary to neurogenic vasomotor disturbances Focal lesions of the extrinsic nervous apparatus of the heart play no significant rôle in the genesis of cardiac disorders Neurogenic circulatory disturbances fall chiefly within the last three categories The cardiac disorders due to excessive afferent stimuli are of little clinical importance Of more significance are reflexes initiated by visceral disorders—the simple tachycardias and occasional bradycardias Of greater import are the occasional cardiac irregularities that are initiated by reflex stimuli from diseased viscera It has been shown that stimulation of the heart nerves will not provoke extrasystoles or auricular fibrillation unless favoring circumstances, such as some toxic injury of the myocardium, coexist Reflex stimulation of the cardiac centers from the brain is a most important cause of neurogenic heart disease The influence of mental and emotional states on the heart is common knowledge It is less often realized that psychic stimuli may provoke extrasystoles and even paroxysmal tachycardia Of equal importance are cardiac disorders due to increased irritability of the visceral nervous system Such a state of "autonomic imbalance" is often hereditary and constitutional, it may follow severe infectious disease, or it may accompany disturbances of the internal secretory glands Irritability of the visceral nervous system causes circulatory disturbances which may result in rapid pulse, dyspnea, vertigo, and fainting The several elements discussed may be closely interwoven in any particular case. The diagnosis of neurogenic heart disease must be made primarily by the method of exclusion, by eliminating every possible organic cause The positive signs do not differ from those of other cardiac disturbances Successful therapy depends upon the study of the individual patient in the light of his disturbed physiological process

What Kinds of Newborn Children Should Be Subjected to Vaccination Against Tuberculosis—Jules Renault asks this question and in answering it suggests three categories 1 Those who have been in daily contact with tuberculous parents and when previous children have succumbed to the disease as presumably transmitted by heredity (as a matter of fact we know that actual hereditary transmission is very rare) Earlier child conservationists have thought of protecting such children by segregation from their parents and others 2 In this group the parents are sound but there is reason to accuse some other contact, as that of a grandparent or nurse In these supposed transmitters the general condition may appear to be good, but exhaustive study may show a pulmonary lesion This class of tuberculous subjects has long been known and it has been advised never to allow a presumably healthy infant to sojourn in close contact with an adult unless the latter has been duly studied for the possible presence of masked tuberculosis 3 In this group there is absolutely no evidence of exposure to an active or latent tuberculosis, yet the inference is that such contacts have taken place The author cites many figures of mortality from the disease in young children in earlier times, and also others from the 100,000 or more who have been vaccinated by the Calmette method He finds a group in which 28 vaccinated children succumbed to tuberculosis and where an antagonist might have accused the vaccination of propagating the disease. It is, however, remarkable that the Calmette method has not bred hostility, but rather support.—*Bulletin de l'Académie de Médecine*, November 6, 1928

Preventive Vaccination of Infants Against Tuberculosis—Calmette given an analysis of the results of vaccination with his product known as BCG Results before 1924 are briefly outlined and he then proceeds to cover the past four years One special group comprises such infants as were actually predisposed to contagion These were made up of two subgroups, viz, 879 born of tuberculous mothers and 1,489 raised in a tuberculous milieu Control figures of other material are used as a check, and the author believes on a basis of these figures that he has brought the mortality down to almost three-fourths of the expectation As by-products the author cites much evidence that the vaccinated children show an increased immunity against the ordinary diseases of infancy and childhood although he is unable to suggest how this is brought about As for actual comparison with controls he regards the normal expectation of tuberculosis in unvaccinated children as 18 per cent, as against 10 per cent in the vaccinated Many minor statistics are quoted which tend to uphold the author's contention. A discussion followed the reading of the paper in which Roux spoke of the mixed attitude toward all innovations in medicine Thus Pasteur was accused of spreading in place of preventing rabies Calmette has first of all

MEDICAL PROGRESS

Accidental Transfusion of Leucemic Blood—Karl Gramen reports a case of accidental transfusion of leucemic blood which seems to be the first case of its kind published The donor, who was apparently in good health at the time of the transfusion, was admitted to the hospital seven weeks later He then presented signs and symptoms of acute leucemia Two weeks after admission he died and the clinical diagnosis was confirmed at autopsy The recipient, who was transfused for anemia due to a severely bleeding duodenal ulcer, died two weeks after the transfusion The writer raises the question whether leucemia can be transferred from man to man through blood transfusion Alfred Petterson grafted bone marrow from a case of acute myeloid leucemia into the myeloid cavity of the tibia of six apes with negative results Again four patients with inoperable cancer were given intravenous injections of blood, three from patients with myeloid and one from a patient with lymphatic leucemia The results were negative in all cases Experiences of this subject are too few and imperfect to justify one in drawing conclusions, but there is nothing in favor of the possibility of such a transmission Myeloid leucemia is a rare disease and it is still rarer to find a person with this disease in such good condition as to be considered a suitable donor Nevertheless, it seems advisable for the present to add to the number of preliminary tests in blood transfusions also one for leucemia in the donor—*Acta Chirurgica Scandinavica,* November 22, 1928, lvix, 3-4

Some Considerations in Relation to Functional Diseases of the Heart.—Thomas J Horder discusses the problem of assessing aright the cardiac factor in patients, from whatever disease process they may be suffering In the majority of cases we are dealing not with a disorder of the heart—still less with a disease of the heart—as distinct from the rest of the body, so much as with the cardiac reference in the patient's consciousness It is important to give the heart-conscious patient the knowledge that the serious diseases of the heart are for the most part silent as regards heart sensations, whereas innumerable ailments that are relatively minor in their significance are garrulous with the heart as a mouthpiece It should not be assumed that early structural changes are present, since that policy may lead to the production of invalidism and an exaggeration of heart consciousness Nor should one hastily resort to cardiographic methods, for the graphic school of cardiologists makes heart invalids in no small number The symptoms in functional heart affections (palpitation, fainting, precordial discomfort, lassitude, giddiness, breathlessness, and pain) do not differ from those found in many cases of structural heart disease, but their relative incidence is quite different Thus, in proportion as palpitation is prominent the probability of functional disease is high Even with the symptom of breathlessness, there are pitfalls for the unwary The efficiency tests, such as running upstairs, may be vitiated by a little emphysema, a set of atonic muscles, a distended stomach It is the combination of all the symptoms of the syndrome in the absence of defects elsewhere which signifiy cardiac insufficiency After discussing the toxic heart, the tobacco (and tea) heart, the pubescent heart, the nervous heart, etc, Horder states that these are not really toxic hearts or nervous hearts, but hearts in toxic patients, in nervous patients, etc To judge these cases aright, and to treat them adequately, it is essential to decentralize, to move away from the heart and its complex symptoms to the rest of the body, to inquire about everything and to observe everything—*The Practitioner,* December, 1928, cxxi, 6

The Possibility of a Peripheral Treatment of Cardiac Patients—H Eppinger and K Hinsberg, after a discussion of this subject, sum up in part as follows It is possible by massage not only to bring about an improvement in the general condition, but to cause a change in the metabolism The authors are far from denying that psychic influences may have played a rôle here, but the fact that the chemistry of the individuals was changed by these peripheral manipulations is not to be sidetracked either Aside from the three patients who figured in the test we must not forget that cardiacs are often benefited by massage and that the results have at times been brilliant This is of course contraindicated in cases of decompensation at its acme and when there is marked edema, but not in the intervals, after digitalis treatment Massage of course stimulates the sluggish peripheral circulation and as the authors say "capillarizes" the muscles Doubtless massage will do much to prevent the abuse of digitalis and an acquired tolerance to this valuable remedy In the first case cited by the authors, one of marked decompensation, there was little benefit from digitalis and diuretics No drugs were taken for three weeks before or after the massage treatment The patient received several seances of massage in the course of a rest cure The second patient responded to drugs, but the success of the massage treatment led to suspension of medicamentous measures The third patient was the worst off of all, yet respond-

when they occur tend to group themselves under the disease known as thromboangitis obliterans There is evidently a basic disease which may or may not terminate in gangrene Recently a group of three cases, shown at a meeting of a local medical society, might have been comprised under "Buerger's disease," but in the absence of a histological study the author would prefer to leave the diagnosis open and term the condition an "arteritis of unknown origin" Long before the time of Buerger's disease, clinicians spoke of an arteritis obliterans, clinically expressed by intermittent limp, etc If the problem is approached from a different angle, such as chronic nicotine abuse, with or without the contribution of other factors such as exposure to cold, cases may come to light which do not fit into the frame of Buerger's disease Of particular interest is one case reported in great detail in which with every reason to anticipate gangrene of the upper extremity, this sequela did not develop The patient was a dentist aged 33, who had symptoms of defective circulation in the right upper extremity The hand was painful, pale, and cool The radial was pulseless to the finger and sphygmograph The patient was a neurotic, a heavy smoker Various symptoms which developed under observation suggested that the same arterial constriction occurred in other portions of the organism, including the brain Nevertheless the brunt of the disease was limited to the right forearm, in which the symptoms had at times been so acute that a diagnosis of thrombosis of the brachial artery had been made —*Munchener medizinische Wochenschrift,* Nov 16, 1928

Oral Sepsis —Rudolf Weber accepts the American conception of focal oral infection, but with many important reservations To be scientific, he says, this subject demands proof of alterations in the blood which indicate a pathological condition He finds that in the acute parodontitides, whether apical or marginal, the entire organism reacts, as shown by changes in the sedimentation and differential blood count On the other hand he is skeptical that encapsulated apical lesions are able to infect the blood and tissues at a distance The role of acute flare-ups of chronic root troubles appears to be in doubt He seems hostile to a belief in a bacteriemia, being inclined rather to the view that streptococcus toxins are a factor in disease production In this connection the author asks whether the virulent cocci in the teeth and alveoli should not form antibodies in the blood These might be demonstrated to be present and from another angle their presence might produce immunity of the distant tissues to injury He investigated some acute cases with results quite negative He also devised a skin test by means of a polyvalent serum prepared from dental granulomata in order to determine the possible presence of an allergy, but his experiments here were also negative The problem is enormously complicated by the possibility of other foci of streptococci in the body—tonsils, nasal sinuses, gall-bladder, etc Even if biological reactions could be obtained it would be difficult to associate them with a purely dental origin It is evident finally that many clinical cases of alleged oral infection and cure by extraction, etc, have a much too short period of observation. These patients ought to be followed up for many years —*Munchener medizinische Wochenschrift,* November 2, 1928

Thrombophlebitic Angina. — H Doerfler writes at length on septic sore throat which is in reality ordinary tonsillitis or angina with secondary sepsis and bacteriemia resulting from venous thrombosis He does not speak of any mass incidence or of epidemics traced to milk, but the disease is apparently the septic sore throat which has occurred of late years in the United States One case is described at great length in which the internal jugular was resected, the patient surviving despite double embolic pneumonia The mortality is staggering and although no totals are quoted, Bertelsman was unable to find more than 9 cases of recovery after the development of thrombophlebitis, and the total death rate is estimated as at least 90 per cent The affection is regarded in some quarters as new—a disease mobilized by post-bellum conditions The deadly nature is a mystery at present, for either we must invoke a new exciter of unusual malignancy or there is an unknown factor which makes possible the complication of thrombophlebitis starting in the tonsillar veins It is conceded that operation alone can save the patient after this complication sets in, but the records show that this does not work out in practice, for the resection or ligation of the internal jugular has frequently failed Evidently failure has often been due to delay, hence the author, bearing in mind the malignant character of the affection, would operate as soon as the tissues about the vein have begun to swell The author's patient had an ordinary bilateral follicular tonsillitis but she had repeated chills which recurred daily The regional lymphnodes were hardly involved The internal jugular was examined daily with negative results, but the development of a focus of pneumonia appeared to incriminate the vein and the operation was at once performed —*Münchener medizinische Wochenschrift,* Oct 26, 1928

shown the harmlessness of his vaccine, and of his vaccination The parallel figures seem to speak for themselves but other questions come up—how long does the protection last? Must it be repeated, and when? Lignières was somewhat skeptical and in several directions The vaccinated must be controlled in regard to growth and weight gain in order to make sure that vaccination is entirely innocuous Another element is the application of the tuberculin test to the vaccinated, this may, as in a case cited, be positive—*Bulletin de l'Académie de Médecine,* Nov 6, 1928

On Clothes—Leonard Hill, writing in *The Practitioner,* December, 1928, cxxi, 6, states that the clothing should be the lightest that can be borne without the wearer being pinched with cold or feeling the need of artificial heat when the weather is mild It should not be so heavy as to reduce the heat production of the body to a lower level and interfere with the taking of vigorous exercise It is absurd, he says, to put on an overcoat when going for a walk It is good to go out and be braced by the cold and so be impelled to take vigorous exercise It is only the old, the underfed, and the feeble who require very warm clothing The reduction of clothing has done women no harm, they have suffered no more than men from "colds," pneumonia, and rheumatism, their death rate has not been put up People of all classes overclothe children and confine them far too much to hot, stuffy rooms Babies are not delicate but able to withstand exposure to cold When they are well-fed, and exposed naked to open air and sun, with plenty of kicking and crawling exercise, long sleeps out of doors, and light clothing, they grow up virile, with strong muscles and firm bones The properties of garments depend almost wholly on the nature of the weaving so far as concerns air-holding, evaporation, and permeability to wind and light Comparison of knitted cotton, wool, and linen, made with the kata-thermometer, show that the nature of the material makes little difference and that it is the air entangled in the meshes which protects The loss of body heat by evaporation is greatly increased through wet clothes Wet flannel entangles more air next to the skin and is warmer than wet cotton or linen The observations of Argyll Campbell and the writer on the rate of heat loss from the body exposed to wind or to sea waves either naked or in light clothing, or in such clothing plus a waterproof suit, showed that the protection afforded by the last was great, reducing the heat loss by one half It is not food and drink, but a waterproof garment which is required to keep life in shipwrecked folk on rafts until succor comes The cooling power of the wind is enormous when the temperature is low and the velocity of the wind great To resist this, flying or Arctic clothing must consist of wind-proof material or water-proofed cloth, and inner layers of soft fluffy wools, and must be so constructed that no wind is admitted at the neck, wrist, or ankle.

The Treatment of Patients With Inoperable Cancer—In discussing the difficult problem of dealing with the mental state of the patient with inoperable cancer, R B Wild believes that whenever possible it is better to avoid telling the patient the nature of his disease, since this knowledge may make him at once a chronic invalid, although no physical change has taken place in the disease If the patient knows he has cancer, it is most desirable to hold out the hope of recovery even to the last For the cachectic state he advises fresh air, tonics, and alcohol As a tonic he relies upon small doses of arsenic with ammoniocitrate of iron, and either calumba or gentian If iron disagrees, the arsenic can be given with dilute hydrochloric acid and compound tincture of cinchona Alcohol is a most valuable agent, it acts as a euphoric, relieves pain, and is a food which requires no digestion It helps the patient to bear his troubles and prolongs his life by four to six weeks The amount need not be large—the equivalent of two ounces in twenty-four hours It is best to put off as long as possible the use of opium or morphine In the early stages acetosalicylic acid is most useful and does no harm, 10 to 20 grains may be given every eight hours so long as it is effective Then it may be replaced by phenacetin, pyramidon, or acetanilide, but care must be taken lest the anemia be increased The luminal group of drugs Wild has not found useful When these agents no longer afford relief, there should be no hesitation in giving opium or morphine For regular use over long periods opium is preferable in the form of the liquid extract, beginning with 10 minims every eight hours In the most severe forms of pain we must resort to the hypodermic use of morphine, either as a substitute or in addition to oral administration Local anodynes may be applied to ulcerated surfaces, the most useful being phenol or guaiacol in solution, the subacetate of lead as a lotion or paint, and orthoform in fine powder For ulceration of the mucous membrane, the use of a lotion containing borax, chlorate of potash, and a balsamic extract gives relief The best internal remedy is tincture of belladonna, doses of 20 to 30 minims may be required For a continual oozing of blood from a large ulcerated surface there is nothing better than a solution of perchloride of iron—*The Lancet,* November 24, 1928, ccxv, 5491

Gangrene of the Extremities in the Young—C Handwerck discusses briefly this subject which occasionally becomes of interest By the term "young" as used in this connection any age up to forty may be understood Cases of this description appear to be rare in Germany and

Read the orations of the greatest orators of time and you will find running through all of them a subtle grasp of the feelings, emotions and susceptibilities of the audience addressed One of Lincoln's supreme attributes was tact He possessed, as perhaps no other American before or since has had, a "fine perception," an intuitive sense of what is true, right and proper When he assumed the Presidential office with most of the Southern states already out of the Union preparing for war, he closed his Inaugural with these words "We must not be enemies, but friends The mystic chords of memory stretching from every battlefield and patriot grave to every living heart and hearthstone all over this broad land, will yet swell the chorus of the Union when again touched as surely they will be by the better angels of our nature" It was statesmanship, it was tact in the truest sense, for tact is statesmanship

No shrewder American than Benjamin Franklin has ever lived His autobiography is a veritable storehouse of wisdom He understood human nature and the value and importance of tact In his autobiography he has told how he schooled himself in the use of "terms of modest diffidence, never using when I advanced anything that may possibly be disputed, the words *certainly, undoubtedly*, or any others that give an air of positiveness to an opinion, but rather say, I conceive or apprehend a thing to be so and so, it appears to me, or I should think it so and so, for such and such reasons, or I imagine it to be so, or it is so, if I am not mistaken This habit, I believe, has been of great advantage to me when I have had occasion to inculcate my opinions and persuade men into measures that I have been from time to time engaged in promoting, and as the chief ends of conversation are to inform or to be informed, to please or to persuade, I wish well-meaning, sensible men would not lessen their power of doing good by a positive or assuming manner that seldom fails to disgust, tends to create opposition and to defeat every one of the purposes for which speech was given to us "

King Solomon, if he is correctly reported in the Proverbs, estimated tact at its true worth "Even a fool," he said, "when he holdeth his peace is counted wise, and he that shutteth his lips is esteemed a man of understanding" And again "A fool's lips enter into contention and his mouth calleth for strokes" And still further "Surely the churning of milk bringeth forth butter, and the wringing of the nose bringeth forth blood, so the forcing of wrath bringeth forth strife"

Perhaps there is no calling or profession in which the use of tact is more indispensable than in the practice of medicine The physician is constantly in contact with human beings Their ills, deformities, physical and mental states and conditions, form the subject-matter of his life work In his practice he encounters all kinds and conditions of men and women, kind as well as malicious, appreciative as well as critical, intelligent as well as ignorant, reasonable as well as unreasonable, fair as well as mean, generous as well as selfish He will find patients who will become his warm friends, and those who will become his enemies He will find those who pay him promptly appreciating all that he has done, and those who reward him by abuse, criticism and perhaps an action for malpractice

Every patient is a human being requiring special study and special handling Some will require more special study and more special handling than others, but he will need to use his discernment and his perception of what is right or proper in treating every patient

The laity too often forgets that the physician himself is a human being, with human emotions, subject to weariness and fatigue, depression and discouragement, just as all men are The physician will have much to irritate him, annoy him and harass him He will have much to outrage his sense of justice, and he will receive slights, coldness or abuse where he should receive courtesy and appreciation Yet, the outstandingly successful physicians are the men who not only possess unusual knowledge and ability, but who have so mastered their own feelings and emotions, that they can deal with their patients without permitting their own feelings to influence their conduct or their speech A soft-spoken or a friendly word will do more than any sign of anger or irritation, regardless of the provocation

In my study of the causes which give rise to litigation between patients and their physicians, I have not infrequently been able to trace the trouble to some hasty or ill-considered comment made by a physician in a spirit of pique or annoyance It has been easy for me to sympathize with the doctor when the provocation was understood, at the same time I have been able to see how the patient took umbrage at what was said or done, which umbrage grew and developed into a desire to injure the physician, and publicly to condemn him in court or elsewhere

Especially is this true in dealing with the gentler sex Women, even in our day of liberation, are less acquainted with the ways of the world and have less experience in life than men, and therefore frequently are more unreasonable and more difficult to deal with Everyone knows this Any lawyer will tell you that it is so I have been told by some members of the New York Stock Exchange that they will not accept women customers, having found to their regret how difficult it is to explain to a woman why her particular venture in the market has not turned out to her advantage.

The physician obviously cannot draw the line of sex between his patients Indeed, many physicians deal almost exclusively with women patients The gynecologist, the obstetrician and the pediatrician, for example, spend necessarily most of their

THE IMPORTANCE OF TACT IN THE PRACTICE OF MEDICINE*

Every professional man, whether doctor, lawyer or clergyman, must have observed that much of the important and useful information conducive to a successful professional career is not included within the curriculum of the college or professional school which he may have attended In the handling of hundreds of malpractice actions against physicians, it has often occurred to me that had the particular physician involved been more conversant with his legal rights and obligations, the lawsuit might not have resulted I have been told that the medical schools of England provide a complete course in medico-legal jurisprudence The graduates of such institutions therefore, embark upon the practice of their profession with some knowledge of the complicated principles of law which govern and surround the practice of their profession I am likewise told that a similar course is seldom found in the curriculum of any medical school in this country My experience would lead me to believe that this is true I have sometimes been amazed to discover how imperfectly some medical men have understood their legal rights and duties A knowledge of some of these principles, and a proper application of them, would be of untold benefit to the profession

Much that a lawyer or a clergyman should know is utterly unknown by the average well-grounded graduate of the theological or law school No lawyer or spiritual adviser can give really helpful advice or assistance until he has learned a great deal of human nature. Great lawyers and judges have become such only through a thorough knowledge of their fellowman, his motives, his prejudices, his generosities, his selfishness, his hopes, his fears and his aspirations No less is this true of the medical practitioner

In my observation of and acquaintance with hundreds of lawyers and doctors, it has often impressed me that one of the most valuable, yet least appreciated qualities is that of tact. The word "tact" is defined as "mental perception, especially, fine perception, intuitive sense of what is true, right or proper, fineness of discernment as to action or conduct, especially, a fine sense of how to avoid giving offense, ability to say or do what is best for the intended effect, adroitness, cleverness, address" Perhaps the simplest, and for my purpose the most useful, definition of the term is embodied in the words "fineness of discernment as to action or conduct." A further study of the definition reveals that tact is not unakin to conscience or a sense of right and wrong It is the "intuitive sense of what is true, right or proper" What I have in mind through the use of the word "tact," is not mere "adroitness" or "cleverness" or "ability to say or do what is best for the intended effect" Such a use of the term might carry with it an invidious meaning, which should be absent from what I am endeavoring to discuss Tact is not mere adroitness or cleverness, but the fine sense which enables a person, under a given set of circumstances, intuitively to do what is right and proper

A tactful person is a person possessing "nice discernment" Discernment means "acuteness of judgment, discrimination, a considerable power of perceiving differences in regard to matters of morals and conduct"

A reading of history and biography, especially the history of diplomacy, demonstrates how large a part tact has played in the success of great men Emil Ludwig in his brilliant life of "Napoleon," which you all have read, paints a fascinating picture of one of the greatest geniuses of all time In the whole record of human annals there is no more astonishing performance than the young Corsican's conquest of Italy at the age of twenty-seven But however much we must admire the valor and the brilliant strategy with which the future First Consul rushed from one victory to another, we find perhaps even more impressive the tact which this young general showed in his dealings with the kings and generals who opposed him When, for example, he made his victorious entry into Milan and was greeted by the venerable Archbishop with his train of counts and dukes, Napoleon listened and then answered "France wishes the Lombards well," remounted, saluted and rode on The crowds were amazed and impressed at the absence of arrogance of the conqueror By these simple words he demonstrated himself "a master of the ruler's art" What he employed was nothing more nor less than tact All great generals have used tact as well as tactics

When the Apostle Paul stood on Mars' hill and said to the Athenians that he perceived that they were a religious people, he furnished one of the greatest of all examples of tact With this prelude he gained the ears of the Athenians for the new religion which he was preaching

*Delivered before the meeting of the New York County Medical Society at the Academy of Medicine on December 21 1928.

LONDON LETTER

WINTER SESSION IN LONDON MEDICAL SOCIETIES

The familiar work of the Winter Session is in full swing in the London Medical Societies The Royal Society of Medicine has held its Annual Dinner under the chairmanship of Lord Dawson, and the May Fair Hotel was thronged with a record attendance So great indeed was the demand for tickets that it was impossible to find room for any guests other than the official guests This was due probably to the fact that two of the most famous orators of the day were speaking, Mr Rudyard Kipling replying for the guests, and Mr Winston Churchill, Chancellor of the Exchequer, proposing the Royal Society of Medicine Mr Kipling carried the great gathering with him in a whimsical though scholarly survey of the emotions which would assail Mr Nicholas Culpepper, the astrologer-physician of 300 years ago, if he could revisit the scientific world of to-day and he felt quite sure that when the old time physician was introduced to wireless and to the wonders of radium he would exclaim "What was the aspect of the Heavens at the time these phenomena occurred?" "And," queried Mr Kipling, "what answer would he get?" Mr Winston Churchill in more serious vein spoke o the important part which medicine took in Imperial work and referred also to the invaluable assistance to the cause of world medicine rendered by the League of Nations The beautiful diction of this polished speaker secured for him a *success d'estime*

London is moving at last in its determination to possess a supply of radium commensurate with its constant and growing needs Perhaps in no other department of surgery has such rapid progress been made as in the radium treatment of cancer For cancer affecting certain organs of the body radium is taking a foremost place. Particularly hopeful is the outlook in cancer of the tongue and buccal cavity, of the larynx and of the uterus, and reports are constantly coming in of successes in treating cancer of the rectum and of the urinary bladder Perhaps the most striking results are seen in cancer of the buccal cavity, a region which when attacked by cancer could be dealt with only by the most severe and crippling operations, operations which carried with them a high mortality and a sad record of recurrence. With the aid of the "radium gun" which ought in its most modern guise to be better termed the "radium revolver" the tongue can be treated in a few minutes and the immediate result attained is the disappearance of the growth with a minimum of scarring and freedom from fixation It is too soon yet to speak of the final results, but I was privileged a short time ago to see cases which had been operated on three years ago, and found them free from recurrence and with almost perfect function Within the last few days St Bartholomew's Hospital was received £14,000 for the purchase of radium, the Westminster Hospital is spending almost as much in adding to its supply, and a Poor Law Institution in the North of London has applied to the Municipal Authorities for a grant of £12,000 for this purpose We see here many indications that the great impetus given to radium therapy by the London Radium Institute is bearing fruit at last If there is any wealthy philanthropist in the United States who wishes to provide a parcel of radium for use in the Old Country, I can help him to place it to the best advantage!

Sir Berkeley Moynihan, President of the Royal College of Surgeons is particularly gifted in that he is not only a brilliant surgeon and teacher, but he is also a profound thinker, and can clothe his thoughts in words of real oratorical beauty His latest pronouncement was delivered on the comparatively modest occasion of the opening of a Bazaar in aid of the Beeston (Leeds) Parish Church I fear he must have shocked some of his hearers when he announced his disbelief in the doctrine of original sin! "I believe," he said, "that children are born the purest things the world knows, and that whatever vice creeps into the life of a child is something that creeps in from outside I believe there is far more of the saint than of the tiger in mankind, and that there is a nugget of pure gold in the heart of everyone of us" As may be imagined it was not long before such a profession of faith was challenged and by no less an authority than Sir John Bland-Sutton who maintained that heredity is the basis of everything in human nature It was not he but another who quoted Jeremiah "The fathers have eaten a sour grape and the children's teeth are set on edge" The discussion, if carried on as it has started, should prove amusing, if not instructive

H W Carson, F R C S, Eng

working hours with women Women especially need tactful and gentle handling They require patient consideration, infinite patience ofttimes is needed successfully to deal with them How difficult, how trying and how nerve-racking this ofttimes is, you gentlemen of the medical profession know far better than I do What I am here advocating is not merely "a good bedside manner," but "a fine sense of how to avoid giving offense"

A course in medico-legal jurisprudence may be feasible in the medical schools I doubt if the study of tact could be added to the curriculum If it could be, it would be of infinite value to the prospective doctor Some physicians may succeed without it, although I believe that many fail because they lack it Certainly the development of this rare quality could injure none of them Some men are naturally tactful, others naturally brusque Those who are tactful by nature may indeed deem themselves fortunate, those in whom this quality is less developed, might strengthen it by study, practice and application

Not only is tact important in the physician's relations with his patients, it is equally important with his brethren in the profession, and with others The physician does his work alone He usually must make his decisions unaided In the sickroom or the operating-room, his position is not dissimilar to that of the general on the field of battle It has been said that military men do not make good statesmen, because of their arbitrary point of view They are accustomed to give orders, and to see them obeyed without question They brook no discussion, no argument In this respect, the training of the military leader is not wholly dissimilar to that of the doctor and the surgeon The quality of decision and self-confidence is indispensable to a successful professional career, but with this there should be developed a generous tolerance for the views of others In the various disputes between medical men which I have encountered, I have usually felt that the differences might easily have been avoided, had more tact been employed on both sides of the controversy

Tact is "the intuitive sense of what is true, right or proper" This sense should preclude one physician from unjustly or unnecessarily criticising the diagnosis or treatment of his predecessor If what his predecessor may have done is wrong, he should do what he thinks is right, but this does not justify unnecessary and unwarranted attack upon the other doctor More rather than less cooperation among the doctors is desirable This requires a mutual sympathy and understanding—"a fine sense of how to avoid giving offense"

The doctor is an individualist, his whole training makes him one He should be one, but there are dangers, as well as advantages, in individualism Sometime ago, I wrote an editorial under the title "Individualism, Its Merits and Its Dangers" Some of you may remember it. Individualism is not incompatible with tact No matter how outstanding a man may be in his chosen calling, how extraordinary his gifts or how celebrated his attainments, it is possible for him in his dealings with his fellow man, to display modesty and consideration for the feelings and the opinions of others Some of the greatest individualists have been the most tactful of men

Tact does not mean weakness Tact does not require the surrendering of honest opinions formed as a result of profound knowledge and deep reflection Tact is not a synonym for cowardice Tact does not require a weak or indifferent acquiescence in what is wrong or untrue. Tact is the high ability of a broad-minded man to conduct himself with his fellowmen in such a way as to avoid needless and unnecessary friction, annoyance and hatred Tact involves an effort to understand another's point of view and to give it due weight and consideration Tact prevents a man from arrogance or the needless wounding of another's feelings and susceptibilities The development of tact requires the fostering of large-mindedness, openmindedness and fairness A truly tactful man is an understanding man, usually a big man

I could multiply ad infinitum instances of tact employed by members of the medical profession in the treatment of their patients On the other hand, I could cite examples where unintentional tactlessness led to trouble *The less the understanding, the smaller minded the patient, the more important that his medical adviser should be tactful with him*

In concluding these observations, I might justly be charged with tactlessness myself were I to leave unanswered the possible suggestion that what I have here said implies that the members of the medical profession are more tactless than those of other callings or professions I disclaim any such suggestion *What I do say, however, is* that there are very few callings in which the employment of tact is more important, more necessary or more productive of reward

follow-up work attendant upon the discovery of defects in school children 3 The establishment of a regular routine of clinics conducted by members of the County Medical Society, covering all the non-tuberculous conditions, extending to all parts of the county, for the more complete diagnosis of the gravity of the defect, for the supervising and advice leading toward preventative or curative treatment

In offering this program, the committee explained that it is not its desire in any way to encourage pauperism or dependency through the medium of these clinics, but it rather hopes by them to bring home to the parents their full responsibility in the matter of preventative and curative care However, the committee recognizes that there will be a certain small percentage of instances where the parents are either unable or unwilling to provide proper care or treatment, and in such instances, the town, city or county should provide the medical care indicated, in a manner similar to that which now prevails in the treatment and care of all tuberculous children, from which all the stigma of charity has been so successfully concealed The committee asked the Board of Supervisors to make an appropriation of $25,000 00 for the first year, to initiate the program, the principal item of expense to be the salaries of the four public health nurses Among those who appeared before the Board of Supervisors in support of the program were the County Judge, the Surrgoate Judge, the four School Commissioners, representatives of the Mechanicville Rotary Club, of the State Departments of Health and Education, and the County Grange

The chairman of the committee explained that the principal reason why so many uncared-for defects should be discovered among children is that adequate examination of school children is almost impossible under present conditions Most of these children are apparently sound and healthy Their defects are discovered only after careful examination, but the school inspector, who has from one hundred to one thousand children in his district, is seriously handicapped in his examination of them by several conditions, first, he has no examining room in the school building nor facilities for making a careful examination, second, in the rural districts where there are no school nurses, he lacks means for adequately impressing upon the parents the nature of the defect and the need for its correction, third, without clerical service it is almost impossible for him to notify the family physicians of the children of his findings And then, finally, he is, in every instance, inadequately compensated for the work that he is doing now, and in all fairness could not be asked to do more under present conditions

The committee's idea that, for the present, the school physicians should be assisted by volunteer clinical service from all of the physicians of the county, is in accordance with a program which is working effectively in sections of Montgomery County Eventually, however, it is the committee's idea that the physicians should all be paid for their clinical service The program calls for the immediate cooperation of the family physicians in correcting the defects found, and the committee believes that, if the nurses employed to do follow-up work are properly instructed, they could impress the parents with the importance of having the child placed immediately under the care of the family physician

Favorable action is hoped for by the Board of Supervisors at an early date, but the expenditure for the tuberculous children's hospital and maintenance being in excess of $135,000 00 for 1928 and 1929, the Board may be chary about entering into another welfare project at once.

ANNUAL REGISTRATION

The editors have received the following letter from Charles B Heisler, Assistant in Higher Education, in the State Department of Education, Albany, N Y

"May I call to your attention subdivision 6 of section 1260 of the Education Law which appears on page 68 of the inclosed medical handbook Will you be good enough to insert a notice in your JOURNAL calling the attention of the physicians in the state to this provision of the law which requires us to exact an additional fee from those who have failed to register by the first of January? The Department does not desire to enforce this provision any more than it is obliged to, and hopes that all physicians in the state, who have not yet registered for 1929, will cooperate by sending in their application cards immediately"

The section of the law to which reference is made reads

"Any licensed physician who fails or neglects to register by January first of any year as required by the provisions of this section shall be required to pay for registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who wilfully refuses or omits to register hereunder and engages in practice shall be subject to a civil penalty for one dollar for each day that such practice shall continue, and if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said

NEWS NOTES

SARATOGA COUNTY SURVEY OF SCHOOL CHILDREN

A report on the defects of school children, by the Public Health Committee of the Saratoga County Medical Society, John R. MacElroy M D Chairman.

SARATOGA COUNTY is enlarging its tuberculosis hospital by the addition of a building for children The County Medical Society has supported the project and contributed its influence and advice At a meeting about a year ago, when the need for such hospital was under discussion, the question arose as to what other incapacitated children there were in the county aside from those afflicted with tuberculosis The outcome of the discussion was to have the Society appoint a committee, of which the writer is chairman, to make a survey of the children of the county and report at its earliest convenience upon the number and types of incapacitated children This committee set to work immediately, but soon found that it would be practically impossible to include in the survey a satisfactory proportion of the pre-school children It concluded, therefore, to pursue its study among children between the ages of six and fifteen pears This committee made the following informative report at the last meeting of the County Society

There are 12,507 children of school age in the county Of this number 9,903 were examined and the following defects noted

Infected tonsils	2140
Defective eyesight	1248
Malnutrition	768
Nasal defects	570
Glandular enlargements	388
Cardiac defects	170
Defective hearing	94
Goitre	88
Bronchial and pulmonary conditions	73
Orthopedic conditions	66
Mental abnormalities	62
Nervous instability	59
Hernia	32
Asthma	1
Kidney disturbance	1
Total	5760

The report amazed the physicians, particularly when it was learned that only forty-three children from the county between the ages of one and fifteen had been reported to the state as having tuberculosis up to May, 1928, and these were therefore the only children of the defective group of more than five thousand that will benefit by the erection of the hospital

The committee supplemented its report with the following information, secured from the State Department of Health, with regard to the causes of death of children in Satatoga County in the years 1920 to 1927 inclusive In that period of time there were 378 deaths of children between the ages of one and fifteen years, of which 70 were due to accidents The following deaths might be considered as due to preventable causes

Scarlet fever	32
Diptheria	18
Heart disease	17
Measles	11
Pulmonary tuberculosis	8
Diabetes	4
Diseases of the ear	2
Hernia	2

a total of 94 deaths occasioned by what may be ordinarily considered preventable conditions, and of all these 94 deaths, only 8 who died from pulmonary tuberculosis are in the group for which the county takes special preventative precautions

Attention was also called in the report to the need for improvement in conditions attending upon maternity In the period from January 1, 1922 to January 1, 1927, the State Department of Health reported 5,486 births in Saratoga County, and the following list of mortalities Stillbirths —224, deaths under one month—219, deaths under one year—406, maternal deaths from childbirth—28

Program suggested by the Committee In conjunction with its report, the committe offered a program which, in its opinion, if adopted by the county, would in time secure to all children handicapped by defects, correctional services such as are now offered to thos having pulmonary tuberculosis Briefly, the plan is in three parts 1 The appointment of a public health council, consisting of not less than five regularly licensed physicians, one of whom shall be the president of the County Medical Society, and three non-medical members, at least one of whom shall be a member of the Board of Supervisors 2 The employment of four public health nurses, one being assigned to each school commissioner's district to do pre-natal, infant and child hygiene work in cities, villages and rural sections, and school hygiene work in the rural districts where no school nurses are employed, and, as a particular task, to assist the examining school physicians with the

of Oneonta, Alternate to State Convention, Dr F J Atwell of Cooperstown, Censor, Dr E C Winsor, Schenevus

Dr F L Winsor, who has been Treasurer of the Society for over twenty years declined to accept a reelection A most hearty vote of thanks was given him for his long and faithful service

The following resolutions were adopted

Resolved, that in the death of Dr John W Swanson of Springfield Center, who had been a loyal member of the Society for over fifty years and had served as President and Censor, the Medical Fraternity of the County has lost one of its most valued members His interest in the Society was unfailing and his service freely given to any project designed to aid in the advancement of medical progress,

Resolved, that the remembrance of his genial disposition and professional conduct serve as a lesson from the life of a gentleman and a model physician

HARRIE FRINK AND H L CRUTTENDEN,
Committee

On motion the Secretary was directed to send the following word of cheer and good will to our oldest member of the Society, Dr S G Pomeroy of West Oneonta

'The Otsego County Medical Society assembled in Annual Meeting has directed me to send you a word of good cheer and a Christmas greeting Many kind words were expressed by those who knew you in your active life Your worthwhile-ness has been an inspiration to us We wish for you all comfort and happiness during the days left to you to spend on earth May they be as long as you desire them to be

"The bunch of flowers are but a token of our love for you"

Dr Marjorie F Murray and Dr F F Harrison of Cooperstown were received into membership

After the dinner, Dr George McKensie of Cooperstown gave a most instructive paper on Serum Treatment, its dangers and advantages, its accidents and diseases, together with suggestions of administration

Twenty-four members were present

A H BROWNELL, *Secretary*

BRONX COUNTY

The Annual Meeting of the Bronx County Medical Society, held at the Concourse Plaza, on December 19, 1928, was called to order at 8 45 P M, the President, Dr Gitlow, in the Chair

The following doctors were elected members Drs Murray Berger, William G Chorba, Louis Dantzig, Aaron Feldman, Jacob Feldman, Charles A Halberstam, Benjamin J. Margolius, William Reich, Samuel R Schielcrawt, and Harry Weintraub

The following amendments to the By-Laws were proposed

1 Six out of the nine regular meetings of our Society shall be devoted exclusively to the transaction of economic and business problems
2 The Chairmen of all the Committees of our Society shall be nominated and elected by the members of the Society
3 The Board of Censors shall consist of six members, all members to be elected by the Society The retiring President shall be a member of the Board without vote to act in an advisory capacity
4 The Officers of the Bronx County Medical Society shall be nominated by Primary Nominations preceding the election, the details of which shall be perfected by a Committee elected from the floor

It was also proposed that there be a revision of the Code of Medical Ethics It was moved and carried that a Committee be appointed to study this question and make recommendations for the revising of the Code of Medical Ethics

Dr William Goldstein spoke on behalf of the Diphtheria Immunization Campaign that is now being carried on and appealed to the members for their cooperation

The following officers for 1929 were elected President, Harry Aranow, First Vice-President, Joseph H Gettinger, Second Vice-President, Irving Smiley, Secretary, I J Landsman, Treasurer, J Adlai Keller, Board of Censors, Maurice O Magid, Harry Shiffman, Delegates, J Lewis Amster, Cornelius J Egan, Vincent S Hayward Edmund E Specht, Alternates, Milton J Goodfriend, Nathan B Jacobson, Nicholas Lukin, Samuel F Weitzner

The following were elected as members of the Nominating Committee Joseph A. Landy, Sidney Cohn, Moses H Krakow, Louis Sheinman, David Deutschman, Joseph O Smigel, Henry Friedland, Michael Rosenbluth, Adolph Rostenberg, Charles S Rogers, J Bernard Cohen

The program of the evening proceeded as follows Address The State Society's Group Insurance Plan—Up to Date, by Harry F Wanvig, Esq

I J LANDSMAN, M D, *Secretary*

practice shall continue, said penalty shall be recoverable in an action by the attorney-general of the state maintained in the name of the people of the State of New York

"The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this articles shall be the only penalties that may be imposed therefor, and the legality of his license shall not be affected thereby, and such penalties may for good cause shown, in the discretion of the regents, be remitted or compromised"

COURSES FOR COUNTY HEALTH OFFICERS

Dr Matthias Nicoll, Jr, Commissioner of Health of New York State, has sent the following letter to the JOURNAL

"There has never before been a greater need of bringing to the attention of physicians, who are considering full-time health officer work as a career, the splendid academic courses for proper qualification for such work

"The enclosed letter is a copy of one I have sent to each of the District State Health Officers in regard to the above subject Any publicity which you might care to give it through the columns of your JOURNAL would be appreciated and would, I believe, serve a useful purpose"

The letter of Dr Nicoll to the District State Health Officers is as follows

"Since the inauguration of the Cattaraugus and Suffolk County Health Departments, added stimulus has been given to the full-time county health-officer movement in the state

"You may know of certain physicians who have made good local health officers in your district, and who either desire or with some stimulation might consider qualifying for such positions, or for future full-time city health officer appointments

"There is enclosed a copy of a two-page circular describing a short health officer course which will be given at the School of Hygiene and Public Health at Johns Hopkins University in Baltimore from March 13 to June 1, 1929, if ten candidates enroll

"Will you kindly bring this course to the early attention of any physicians in your district who would be interested in it or whom you consider good material? I am personally anxious to see New York State represented in the 1929 class Additional copies of the attached circular may be secured from the Department, or copies of a more extensive catalogue of the School of Hygiene may be secured directly from Baltimore."

The essential parts of the circular are as follows

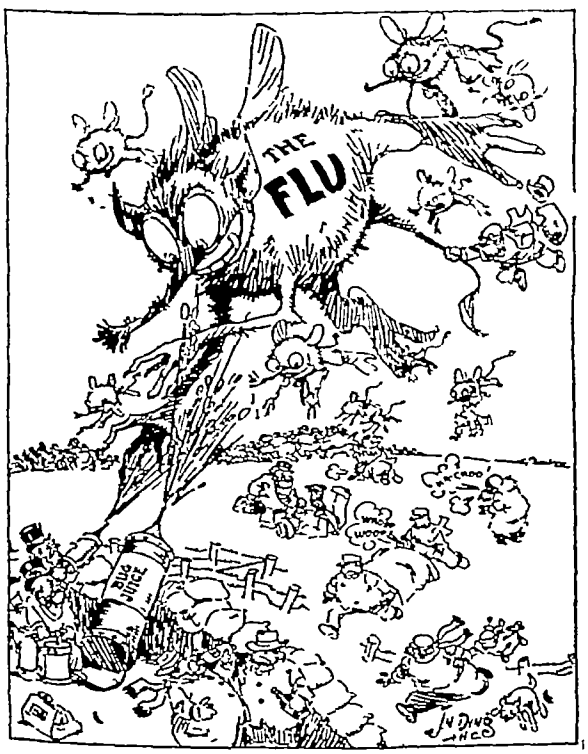
"The primary purpose of the course will be to review and broaden the student's knowledge of those subjects underlying the practice of public health, Statistics, Epidemiology, Sanitary Engineering, and Public Health Administration, by means of special classes given throughout the course, and to acquaint the student with recent advances in the allied biological sciences, Bacteriology, Immunology, Protozoology, Entomology, Helminthlogy, Physiological Hygiene, Chemical Hygiene, and in the Filterable Viruses, by means of a series of lecture demonstrations by workers in these subjects Instruction will be as far as possible by laboratory exercises and field demonstrations

"Candidates for admission to the course must be graduates in Medicine or have had such other scientific training as will fit them for the course Each candidate must give evidence of having had adequate laboratory instruction in bacteriology

"The tuition fee for the course will be one hundred dollars, payable at the time of registration A certificate of attendance will be given those students who complete the course satisfactorily"

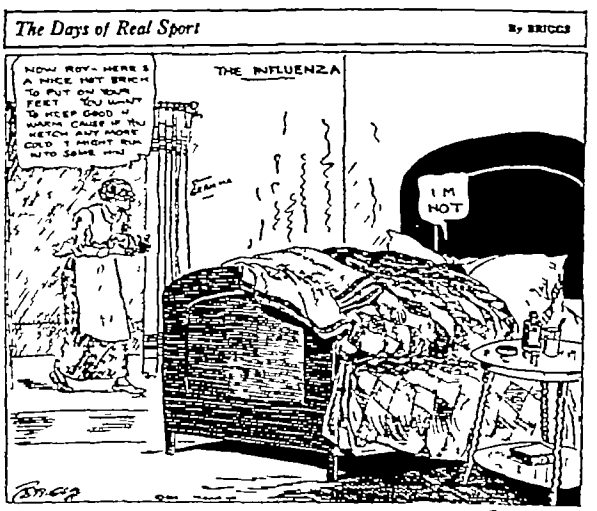
The physicians of New York State will be pleased to know that one of their own number was chosen to be Health Officer of Suffolk County, although Dr Arthur T Davis, the successful candidate, spent two or three years in Delaware as State Health Commissioner It is to be hoped that New York State will have a sufficient number of its physicians take public health courses so that the State may supply its own officers

OTSEGO COUNTY



The Annual Meeting of the Otsego County Medical Society was held at the Elks Home, Oneonta, Tuesday evening, December 11, 1928, with President F J Atwell of Cooperstown in the Chair Minutes of the June meeting and of the September meeting were approved

The following officers for 1929 were elected President, Dr D H Mills of Oneonta, Vice-President, Dr George McKensie of Cooperstown, Treasurer, Dr F E Bolt of Worcester, Secretary, Dr A H. Brownell of Oneonta, Delegate to State Convention, Dr F H Mar-



THE DAILY PRESS

INFLUENZA

Influenza is a stock subject of record in the daily papers, although it has not attained front page notoriety Its prevention is always of interest to the public as well as to physicians, but success in its prevention implies a knowledge of its cause,—and here is where medical men fail to agree. On the one hand there are those who emphasize the old-fashioned conception that influenza, or the more plebian cold, is caused by wet feet and exposure to drafts On the other hand, there are those who emphasize the contagiousness of influenza

—New York *Herald Tribune* Dec. 16 1928 by J N Ding

—New York *Herald Tribune* Jan 7 1929 by Briggs

Two illustrations showing what the cartoonists of the New York Herald Tribune think about the cause and treatment of influenza Their attitude is justified by the quotations from medical authorities which are here printed

Dr Alvah M Doty, Medical Director of the Western Union Telegraph Company, and former Health Officer of the Port of New York, seems to be among the believers in the bad weather theory, for he is quoted by the *New York Sun* of January 4 as saying

"The flu, and the grippe, and a cold are all about the same thing, and the condition to which all three terms are applied is not dangerous, except in so far as it may lead to pneumonia or other complications Much can be done by the individual to avoid falling a victim to the disease, but these preventive measures are very different from those mentioned in the flood of propaganda with which the country is now engulfed The preventive measures consist in such things as wearing warm clothing, keeping one's feet dry, avoiding drafts—in the subway for example—and washing one's hands frequently during the day"

"These elementary precautions are rarely mentioned in the broadcast admonitions of public health authorities and insurance companies Their propaganda, because it deals with matters beyond the practical control of the public, is not helpful, but may even work harm by spreading the illusion that the individual can do nothing for himself to prevent contagion"

The *Sun* then quotes Dr Doty as saying that the contagiousness of influenza is only a theory, for its exact germ has not yet been demonstrated, yet Dr Doty states an explanation that is entirely theoretical, and is the old idea of the "Lowering of Resistance" of the body by coldness and wetness thus permitting germs already in it to grow

MEDICAL WARES

THE INTERFEROMETER

The principles of the interference of light may be applied in the determination of the constituents of liquids and gases Light does not travel so fast in a gas or liquid as in a vacuum, nor so fast in a dense gas as in one of less specific gravity If, therefore, two parallel rays of light from the same source are focused on a screen, but the first passes through air, and the second through a mixture of air and another gas, the second ray will be retarded in its speed and will reach the screen later than the first ray The screen will then either be doubly lighted, or it will be dark, or it will show bands or rings of colors If the crest of the second ray falls on the crest of the first, the light on the screen will be doubled, if the crests and hollows coincide, they neutralize one another and there is darkness, but if the crests and hollows partly overlap, light bands with colored borders will appear

A standard form of interferometer consists of two units, one for examining the substance to be investigated, and the other for examining the standard with which it will be compared One source of light and one eye-piece serve for both units

In each unit light passes first through two slits That from one slit then passes through the substance to be examined and the other through the air The two sources are then brought to a common focus If, for example, a sample of expired air is being examined for carbon dioxide, the ray passing through the sample will be retarded and the image of its slit will be part of a wave length of light behind the other image The result will be a series of colored bands instead of a bright slit

The second unit is for the purpose of measuring the retardation It also admits light through two slits One ray passes through the air, just as did that of the first unit The second ray passes through a piece of plain glass which can be tilted so that the ray will pass through it obliquely and be retarded according to the length of its path through the glass Images formed by the two rays make a second series of colored bands which lie alongside of the first series, and are viewed together by means of the magnifying eye-piece The observer adjusts the angle of the glass until the two series of bands appear exactly alike, indicating that the retardation by the glass is the same as that by the sample

Interferometers of various designs are manufactured, some small and simple in construction, and others large and complicated They are designed for the examination of either gases or liquids, and are often made for special purposes They are used in research laboratories for the examination of gases and serums, and are especially adapted for the measurement of autolysis Practicing physicians may use an interferometer for the rapid determination of carbon dioxide in bedside examinations for basic metabolism

Special interferometers are in common use for testing firedamp in mines Other forms are used for the examination of water and other liquids

Interferometers are also in common use in research laboratories for determinations which need to be far more accurate than those made by a refractometer The wave lengths of the various colors of light are exactly known, and the interference of the waves affords a visible means of measurement of great delicacy

Almost the first extensive use of interferometers was in oceanographic studies for the determination of the salinity of deep-sea water, which is now known to have a consistent variation according to the hour of the day, the location, and the currents

While the instruments were formerly used largely in laboratories for research in pure science, they are now being added to the equipment of clinical laboratories and industrial establishments Scientists formerly looked to Europe for intense research in fields which offered no immediate application either medically or commercially But at the present time the scientists of the United States are coming to have the reputation of leading the world in scientific research of all forms Modern science consists of records made with an exactness that was not anticipated a generation ago Whenever a scientific fact is established, its practical application soon follows Advances in clinical medicine will follow the discovery of new facts by the increasing use of interferometers, refractometers, and other instruments of great precision

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

LIGHTING IN RELATION TO PUBLIC HEALTH By JANET HOWELL CLARK Ph.D Octavo of 185 pages, illustrated Baltimore, Williams & Wilkins Company 1924 Cloth, $4 00

EPILEPSY By WILLIAM G LENNOX and STANLEY COBB Octavo of 197 pages Baltimore, Williams & Wilkins Company, 1928 Cloth, $3.50 (Medicine Monographs Vol XIV)

The Department of Health of New York City bases its campaign against influenza largely on the theory of the contagiousness of the disease, and its spread by means of the excretions of the nose and throat The justification of the theory of the Department of Health and its wide publication is the low incidence of influenza and indeed, most other contagious diseases, compared with their prevalence in places where precautions are not widely published The *New York Sun* of December 17 says editorially

"Commissioner Wynne and his colleagues in the Health Department will do all the official worrying that is required and will take all the official precautions that are possible to safeguard the population Little can they do, each individual can do more for himself and his fellows than all the municipal machinery can accomplish

"The average man can control his nerves, keep cheerful, mind his diet, keep clean, exercise intelligently, rest sufficiently He can keep away from sneezers and coughers who do not cover their noses and mouths while in action He can cover his own nose and mouth when he sneezes and coughs He may be able to avoid some crowds, let him do so, even though it involves an unaccustomed walk And if he is out of luck and the grip grips him, he can call the doctor, as all men of sense do"

The *Weekly Health Review* of the Department of Health of the City of Detroit for December 22 combines the two theories and says

"A mild type of influenza is prevalent in Detroit at present There is no doubt but that large numbers of persons are at present ill with some respiratory infection, but not all of them by any manner of means have influenza, some have colds, others grippe, and some have influenza The line of demarkation between these three conditions is not well defined The primary difference between the three seems to be one of effect upon the individual rather than one of specificity of the causative organism or organisms Whether one has a cold, grippe or influenza depends upon three factors,—first, the amount of infection the individual gets, second, the resistance, or in other words, the state of health of the individual, and third, the care which that person takes of himself as soon as he knows infection exists"

This *Weekly Health Review* is intended for the information of the public, and therefore the expression, "The specificity of the causative organism," will give peculiar satisfaction to negro preachers and others who delight in long words

AUTOMOBILE GRAVEYARDS

How to dispose of discarded automobiles is a problem of sanitation as well as economics Every village dump is cluttered with dead autos which form an open framework supporting garbage and rubbish of all sorts and making ideal homes for rats The automobiles are useless for filling low land, and no one wants them They are the greatest hindrance to the solution of the problem of village wastes, and even New York City is having trouble with their disposal as is shown by the following editorial from the *New York Herald Tribune* of December 29

"Horses, cows and other livestock which pass from this life may be sent to the incinerator or to some manufactory which converts all that is left of them into hides and tallow and other marketable products But when an aged motor gasps its last, its usefulness for any purpose whatever is over and done

"Inasmuch as a good many thousand cars are self amortized every year the question of how to dispose of them has become serious The most prevalent method employed at present is to tow them to some vacant lot, and there leave them to rust their bones away But this must be done surreptitiously and in the dead of night Nothing is as undecorative as a deceased and rusting automobile, and nothing is quite as objectionable not only to the owner of the lot upon which it may be left, but to all the residents of the neighborhood

"So unlovely have become these increasing piles of tonneaus in the Bronx that the board of trade in that borough is seeking relief from the local administration Many plans are suggested, among them being the erection of a smelter to reduce the useless metal to pig iron, or an arrangement by which the vehicles may take passage on garbage barges, consigned to the deep sea, where they will forever cease from troubling That some such solution of the problem may be reached is earnestly to be hoped Not only in the Bronx, but in the outskirts of all the other boroughs land owners seldom visit their holdings without finding that more and more deservedly deserted cars have been dumped there during the watches of the night

"What is true in New York is true not only in all great cities, but in villages and countrysides A motor journey in any direction from New York will go through great tracts that are literally sown with cars, which, if left to the slow process of extinction by oxidation, will remain there many decades Seeking to get rid of them by dumping them into hollows is futile, for earth settles slowly about them, and "made land" composed of scrap sheet iron is likely to be as treacherous as a quicksand or a quagmire In view of rapidly mounting motor production this question must soon be disposed of by city governments Until this is done all plans for making what aesthetic people call 'cities beautiful' might as well be abandoned"

The Hunterian Oration, to the last, The Mitchell Banks Lecture—The Gall Bladder and Its Infections—there is a world of stimulating and constructive thought.

Of particular interest to the young man are the paragraphs upon Surgery and its Limitations To quote "There is nothing in the craft of any Art so exquisitely beautiful that it can surpass that shown by the skilful master of Surgery To watch such an Artist is to realize that only infinite practice, the most solemn devotion to the details of craftsmanship and a profound sense of spiritual dedication to a high purpose, are capable of creating and so ennobling the work of a man's hands"

"The training is arduous must begin under a master's eye must not be lightly undertaken Since the war the incompetent and ill-trained operator is allowed too free a hand." "I am amazed at the ready acceptance by patients of the eager ministration of incompetent operators, when adequate skill and experience are at their command"

The lectures are interesting and instructive and entertaining throughout. Reference is made to the advisability of operating in the early stages of disease rather than after disabling complications have resulted. The Author quotes statistics which show the advisability of early operating not only in cancer but in duodenal and gastric ulcer, cholecystitis and allied lesions The book should be read by the Surgeon, the Medical man and the Surgeon-in-embryo

RUSSELL S FOWLER.

RECENT ADVANCES IN HAEMATOLOGY By A. PINEY, M D Second Edition 12mo of 318 pages Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $3.50

In this little volume of approximately 300 pages the author has given a most lucid description of the morphologic changes observed in the blood and blood forming organs The illustrations, while limited in number, are excellent. The first chapter is devoted to a discussion of the reticulo-endothelial system The author considers Hodgkins disease as a malady affecting the reticulo-endothelium and describes it under the chapter entitled 'reticulo-endotheliosis" An appendix of 35 pages giving the details of hematological technique and text book references will be found very useful

H M FEINBLATT

THE DUODENUM Medical, Radiologic and Surgical Studies By PIERRE DUVAL, JEAN CHARLES ROUX and HENRI BECLERE. Translated by E. P Quain, M D Octavo of 212 pages, illustrated St. Louis, The C. V Mosby Company, 1928 Cloth, $5 00

This book is a valuable contribution to the study of mechanical deformity of the duodenum It treats of duodenal deformity by calculous cholecystitis, essential and stenosing periduodenitis, chronic compression of the third portion of the duodenum by the mesenteric pedicle and the various operative treatments of these conditions There is also a reference to the medical treatment in a Translator's note. In addition there is a chapter upon the radiologic signs of ulcer of the duodenal bulb and a chapter on Intoxication in Duodenal Retention The subject is covered in a comprehensive and well illustrated manner

The book has been written by a physician, a surgeon and a radiologist with the assistance of a chemist. It is not a collaboration in the ordinary sense, for nothing has been put in the book to which all the authors have not agreed It represents the authors' personal experiences but includes many references to the literature.

The book is recommended not only to the general practitioner in that it may aid him in the diagnosis of obscure cases of 'indigestion," but also to the surgeon as a well balanced review of the subject

RUSSELL S FOWLER.

DIATHERMY ITS PRODUCTION AND USES IN MEDICINE AND SURGERY By ELKIN P CUMBERBATCH, M A, B M Second Edition Octavo of 332 pages, illustrated St. Louis, The C V Mosby Company, 1928 Cloth, $7 00

This is a revision of a particularly thorough and authoritative volume dealing with both the medical and surgical applications of diathermy The opening chapters are devoted to an interesting historical note and a clear exposition of the physics of high frequency currents These are followed by three chapters describing both the early and modern machines used for producing the diathermy currents The final chapters present in an interesting and complete manner the use of the currents, their characteristics in medical and surgical use, and their indications The application of both medical and surgical diathermy to the specialties is particularly well described. The book is well written and clearly printed, with excellent illustrations, and can be highly recommended to all students and practitioners

JEROME WEISS

THE PRESCRIBING OF SPECTACLES. By ARCHIBALD STANLEY PERCIVAL, M.A., M B, B C. Third Edition 12mo of 239 pages, illustrated New York, William Wood and Company, 1928 Cloth, $5 00

This little work occupies a very unique place among the numerous compact works on refraction It is a very attractive blend of the practical and theoretical features of the subject It is distinctly modern in its attitude in having adopted the improved values for the optical constants of the eye as worked out by Gullstrand and Tscherning The recent advances in our understanding of the act of accommodation are briefly and clearly brought out

Glancing through the pages of this volume gives one the impression that the subject is beyond the mathematical comprehension of the average ophthalmologist. Such is not the case however, because the explanations are particularly clear and take one in logical sequence through the various steps to a simple solution

We find this little work full of those points which most of us acquire only through years of experience. For instance, Percival shows why some patients see better when their lenses are tipped There is a table to show the cylindrical effect produced by a strong lense when tipped out at the top and in at the bottom Percival says it is a good practice in cataract cases to tip their first lenses downward to attain the correction for some of their astigmatism, as this adjustment can be modified as their astigmatism changes, and so saves grinding a new lense.

All of us would do well to have this book close at hand, not only for its tidbits of wisdom, but also for its real scientific stores

J N EVANS.

CALCIUM THERAPY The Fundamental Principle Underlying Rational Therapeutics By JOHN AULDE, M D Octavo of 420 pages Philadelphia, John Aulde, M D, 1928 Cloth, $5 00

Probably the most bountiful element in nature's bosom, Calcium, seems to have been the most neglected as a weapon in the physician's armamentorium Like aluminum, we were late in recognizing its value, possibly because both are such common commodities A generation of practitioners employed "hypophosphites" and other similar salts of calcium and gave the acid radical credit for such results as materialized when as a matter of fact, the calcium did the work!

According to Aulde most pathologic conditions present a state of sub-calcification, and his reasons for thinking so are plausible and based on good clinical evidence. While the text is more or less redundant, it is, nevertheless, very interesting reading and should be profitable food for thought for those who are employing "mixed endocrines treatment and giving the glands credit for results rather than the calcium salt that serves as an excipient. Certainly, too little thought has been given to the physiologic importance of calcium

M F DEL.

BOOK REVIEWS

A MANUAL OF SURGICAL ANATOMY By CHARLES R WHITTAKER, F R C S Fourth Edition, revised 12mo of 471 pages, illustrated. New York, William Wood and Company, 1928 Cloth, $5 00

This revision brings up to date this very condensed manual of surgical anatomy suitable for quick reference in the more common dissecting problems of clinical surgery The text matter is well supported by a fair number of comprehensive illustrations and diagrams The choice of operations described in the book is somewhat unusual and does not enhance the value of the manual

GEO WEBB

MODERN METHODS OF TREATMENT By LOGAN CLENDENING, M D Second Edition Octavo of 815 pages St. Louis, The C. V Mosby Company, 1928 Cloth, $10 00

This second edition of Dr Clendening's excellent book has all the ear-marks that were so favorably commented upon in the first edition. Many of the newer practices have been added in order to justify the book's title. As an aid in the utilization of therapeutic measures this book has few superiors It is an essential part of the modern therapist's equipment

M F DEL.

PRACTICAL PHYSIOLOGICAL CHEMISTRY By SYDNEY W COLE, M A Seventh Edition Octavo of 479 pages Baltimore, Williams & Wilkins Company, 1926 Cloth, $5 00

This book is exactly what the title implies—an intensely practical presentation of the subject of physiological chemistry Minute directions are given for conducting experiments and the experiments are excellently chosen

Theory, however, has not been entirely neglected The discussion of the principles of mass action and of the general theory of hydrogen-ion concentration in the first chapter is very clear and helpful The same can be said of the chapter on biological oxidations and reductions, which, by the way, is probably the first summary of this work in a text-book. It is a great thing to understand and master a difficult subject, but to be able to explain it in a simple manner is a still greater achievement

The author describes his own method for quantitative estimation of sugars It depends on the time required for complete reduction While it is comparatively rapid and perhaps more accurate than the well-known Benedict method, it is not as simple and will probably not replace it in clinical work

The book has been written by an excellent teacher and is designed for students and teachers It serves its purpose admirably

BENJAMIN DAVIDSON

HEALTH AND HAPPINESS SERIES

HEALTH HABITS By S WEIR NEWMAYER, A M, M D, and EDWIN C. BROOME, Ph D, LL.D 12mo of 207 pages, illustrated New York, American Book Company, 1928 (The Health and Happiness Series)

THE PLAY ROAD TO HEALTH By S WEIR NEWMAYER, A.M, M D, and EDWIN C. BROOME, Ph D, LL.D 12mo of 144 pages, illustrated New York, American Book Company, 1928 (The Health and Happiness Series)

THE WAY TO KEEP WELL By S WEIR NEWMAYER A M, M D, and EDWIN C. BROOME, Ph D, LL.D 12mo of 264 pages, illustrated, New York, American Book Company, 1928 (The Health and Happiness Series)

THE HUMAN BODY AND ITS CARE. By S WEIR NEWMAYER, A M, M.D, and EDWIN C. BROOME, Ph D, LL.D 12mo of 314 pages, illustrated New York, American Book Company, 1928 (The Health and Happiness Series)

These books have a very important place in a health educational series They are particularly suited to children and should be a valuable aid in promoting routine daily health habits

"Health Habits" is written in story form and should portray to the younger child the procedure for keeping well.

"The Playroad to Health" has been written for the slightly older child and in the same way brings home the rules of health in story fashion It combines reading with acting and visualization.

"The Way to Keep Well" is more advanced than the *"Playroad to Health"* It depicts very clearly to the younger teen child how he can keep his body functioning properly

"The Human Body and Its Care explains very vividly and concisely the necessary hygienic rules for health, with very clear and plain illustrations It fills a great need in the latter grades of grammar school and particularly in the "Boy Scout Age" boy

We recommend all four books for use in the school, graded according to the age of the child. The set would be a valuable asset to any family library

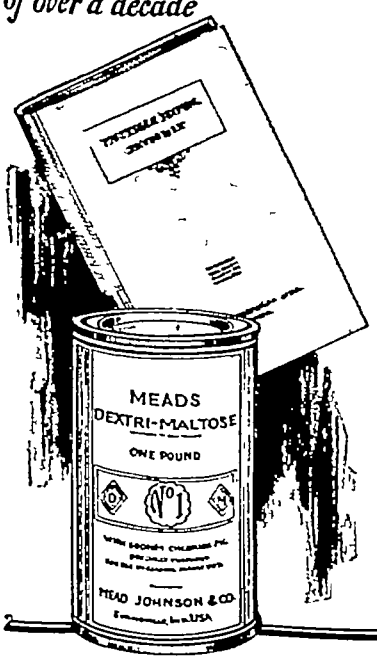
J J WITTMER.

SYSTEMIC INFECTIONS Their Diagnosis and Treatment. By A. KNYVETT GORDON, M B, B C. Octavo of 176 pages New York, William Wood and Company, 1928 Cloth, $4 00

The author, a pathologist, writes on systemic infections for the clinician. He is especially interested in focal infections and vaccines Much that he says is of importance and value to the average physician, for whom many paragraphs of this book are exceedingly instructive. It is unfortunate, however, that the author, like many others, gives so much space—about fourteen-fifteenths of the whole volume—to trite medical statements, useful perhaps to the medical student or nurse, but certainly not to the practitioner, for whom the book was written The author hides some first rate teaching by adding an excess of elementary facts, facts known to all who have ever studied bacteriology But if one has the patience to plow through material that is old and simple to him, he will be rewarded by finding scattered here and there information of great use, knowledge gleaned by years of experience on the part of the author as a pathologist in his contact with clinical problems

ISRAEL H MARCUS

ADDRESSES ON SURGICAL SUBJECTS By SIR BERKELEY MONYNTHAN, Bart. Octavo of 348 pages Philadelphia and London, W B Saunders Company, 1928 Cloth, $6 00



These addresses embody the faith of one who has spent his life in Surgery, a faith which unwaveringly holds that there is no finer craft nor any more sacred mission than the practice of our Art They seek to show that even supreme excellence in our Art is not enough, that Surgery is also the most powerful weapon of research ever placed in the hands of man that the Art of Surgery made perfect is the hand-maid of its Science. So speaks the Author in his preface. A careful reading of these essays bears out the Author's contention There is a repetition but repetition which enforces his teaching or affords illustration From the first lecture,

AMMONIACAL URINE

"As the case improves, dextri-maltose may be substituted for the malt extract so that the final formula reached will contain dextri-maltose as the carbohydrate."

MEAD'S DEXTRI-MALTOSE

From Text Books of over a decade

QUITE apart from the local therapy and care of diapers in the control of cases of ammoniacal urine is the question of diet Diet is an important matter

The etiology, in the majority of these cases, indicates an intolerance for milk fat High fat feedings result in an excess of volatile fatty acids in the stomach and intestines and a condition of "acidosis" prevails

Constipation is a marked symptom Hard, dry, crumbly stools of grey color can be shaken from the diaper without leaving stains, fat indigestion consisting chiefly of insoluble soaps

Dietary treatment consists in the reduction of fats to the infant's tolerance and the increased addition of carbohydrates to restore the caloric value of the food

Mead's Dextri-Maltose No 3 is the indication, first, because of its easy assimilation and second, because it contains an alkali in the form of a 3% addition of potassium bicarbonate to aid in overcoming the constipation

THE MEAD POLICY

Mead's infant diet materials are advertised only to physicians No feeding directions accompany trade packages Information in regard to feeding is supplied to the mother by written instructions from her doctor, who changes the feedings from time to time to meet the nutritional requirements of the growing infant Literature furnished only to physicians

MEAD JOHNSON & COMPANY
EVANSVILLE, INDIANA

OUR NEIGHBORS

A SPECIAL HEALTH TRAIN IN TEXAS

The December issue of the *Texas State Journal of Medicine* has the following description of a special health train—*Editor's Note*

The first page of a folder describing the third annual Missouri Pacific Health "Special," says

"The Missouri Pacific Lines, in cooperation with the Texas State Department of Health, will operate over our lines in Texas, a special train, conveying a comprehensive message designed to stimulate increased interest, in the strictest observance by the people of the state, of all advanced rules and regulations of better health and sanitation

"Before the tour of the better health special train was started, letters were sent to the station agents of the towns where stops were to be made, and literature was mailed to the various civic organizations, schools, and public health officials of these towns The selected groups in these towns then arranged for the proper, and orderly handling of the crowds upon the arrival of the train Placards bearing the date and time of arrival, and departure of the train were placed in conspicuous places about the town, several weeks before its arrival

"The train was composed of seven cars, the first of which, a chair car, was used as a buffer, but, at times, was brought into service as a lecture car The second car, a baggage car, carried the supplies of the train The third car was especially prepared by Dr Carence E Smith, of the United States Public Health Service for the demonstration of measures of milk sanitation Two chair cars were next, which were used as lecture cars The sixth car was especially fitted out containing models and placards, presently to be described, on typhoid fever, malaria prevention and rat control This car was the one into which the public was first shown The last two cars were for the personnel use of the train, and consisted of a dining car and observation Pullman car The two exhibit cars contained more than eighty separate displays and exhibits In the front end of the first car were models of mosquitoes, made chiefly of wood, in characteristic poses Models of the common Culex mosquito and of the Anopheles mosquito were shown, emphasizing the differences in the lighting postures of the two species and some of the other easily recognized differences These models drew a wide range of comment Beside these mosquito models were models of their respective eggs, showing the differences as usually recognized In tanks about two feet square, and two feet deep, were kept some live Gambucian Affinis, or what is usually spoken of as pot-bellied minnows In reality, these are grown fish In vials near this tank were specimens of those fish in their various phases of life The specimens were preserved in alcohol Fly swatters were given to each lady visiting the exhibit

"The various kinds of rat and mice traps were exhibited and the proper method of baiting them was explained

'Pamphlets describing malaria and yellow fever, and the role of the mosquito in the transmission of these diseases, were handed out to everyone who visited the train The prevention of malaria, by killing the mosquito or destroying its breeding places was discussed In this connection, the use of the small fish as a means of doing away with the mosquito larvae, the value of cleaning grass around ponds, draining stagnant pools, and covering rain barrels and cisterns was clearly brought out Demonstrations of poorly screened windows and the contrast of well screened ones were shown The need of a small size of wire mesh was emphasized in the models and exhibits In connection with the mosquito exhibit, as a practical demonstration of malarial prevention, were models of farm places, showing poorly arranged farm buildings, ponds with grass growing around the edges, and uncovered rain barrels and cisterns In contrast to this, models of well-kept premises with everything in accordance with the recognized principles of sanitation, were exhibited

The third car of the train contained the milk exhibits Here were placards advising the drinking of a quart of milk a day, and the use of more milk, and its products in the daily diet, more especially in the case of the younger children Models of pure and impure milk were shown The correct bottling of milk was demonstrated There were also models of sanitary barns for the cattle, demonstrating the proper arrangement of the stalls Model milk pails were exhibited

At the entrance to the first exhibit car was some one of the train's personnel, usually Mr Tom S Bond, assistant chief engineer, Missouri Pacific Lines, who directed traffic, as it were, and who held the official counter, checking each person who visited the train Usually the visitors were asked to line up, in single file, with the youngest school children going through the train first Lectures were not given to the very young children After the people passed into the first car (the sixth of the train), they were requested to move slowly through this car, observe the

(Continued on page 117—adv xv)

(Continued from page 114)

models on either side and pass into the second lecture car ahead and be seated As soon as this car was filled, some one of the physicians of the train personnel lectured for about five minutes on the ordinary communicable diseases of childhood, and some aspects of other public health problems, especially birth and death registration Of the communicable diseases discussed, special emphasis was placed on vaccination against smallpox and immunization against diptheria Measles and scarlet fever were also discussed The greater number of these lectures were given by Drs J C Anderson, Oscar Dowling, E B Parsons, A H Flickwir, J A King and S P Cunningham

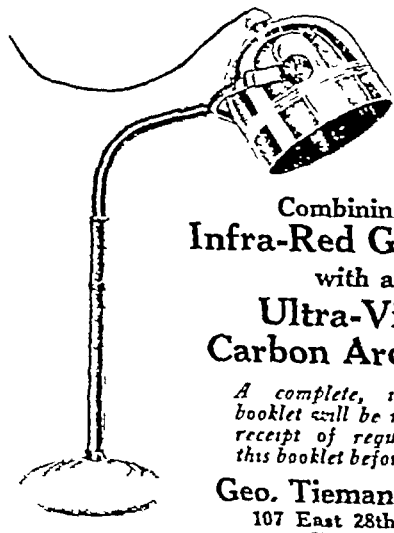
"After this car was filled the second lecture car was opened to the visitors and lectures on safety and accident prevention were given here The importance of crossing railroads at the points designed by the railway was stressed as was the necessity for looking carefully in both directions before crossing the tracks Messrs J P LaBarge, L. A Henry and L Q Linson delivered most of the lectures on these subjects

'Each town was allotted a certain period of time for the train to remain there This period was governed chiefly by the population of the town. It was necessary, in some places, to lecture to the public on the station platforms and outside the train because the crowds in attendance were greater than had been anticipated and it was imperative that the original schedule be maintained The schedule was adhered to practically throughout the twenty-six days of the tour In a few places some of the train officials visited the schools and colleges and gave lectures The train was greeted everywhere with enthusiasm and attention The crowds were most orderly and well behaved Committees met the train practically everywhere and gave it a formal welcome

"To recapitulate somewhat, the train covered about 2,500 miles in 26 days, and visited 110 towns By actual count, 63,450 persons were shown through the train Over 150,000 health educational pamphlets were distributed, and about 10,000 fly swatters were given out.

"Before the tour of the Better Health Special was completed, some striking visible results began to show themselves Immediately following a visit of the train several towns instituted the standard milk ordinance, as promoted by Dr Clarence E Smith That the tour accomplished great good there can be no doubt, however, most of its accomplishments cannot be pointed out as tangible, but are results which are obtained by more accurate knowledge of public health problems, better health, better sanitation, fewer accidents and more rightful living, generally

"Upon the Advice of My Physician"



THE majority of men and women who come to McGovern's Gymnasium to correct some physical condition are sent there directly by their physicians

For more and more physicians are realizing the futility of leaving patients to their own resources when exercises are prescribed, and have learned that through individual attention at McGovern's, their instructions will be faithfully carried out

A work-out will convince you of the superiority of the McGovern Method Let us send you a guest card No obligation, of course

New!

The Battle Creek Super Solar Arc Lamp

For Heat, Light and Ultra-violet Therapy

THE new Battle Creek Super Solar Arc Lamp is unique in the field of Phototherapy appliances It is the result of our own 40 years experience as pioneers in the production of therapeutic arc lamps in this country

Many advanced features of construction make the new Battle Creek Super Solar Arc Lamp noteworthy A snap of the switch starts the arc burning at full power No time is lost in waiting for the rays to attain adequate intensity The lamp being *automatically adjusted by magnetic feed, the largest arc possible* with the given current is always maintained.

A specially constructed adapter is furnished with the lamp It is designed so that the arc does not heat the applicators Any standard quartz applicator may be attached

By giving off rays in both the infra red and ultra violet the Super Solar Arc may be used to successfully treat a wide range of diseases The technic of handling it is easily mastered. Various spectra are instantly obtainable by the use of different carbons

We have recently prepared a new bulletin which describes fully the many advantages of the new Super Solar Arc Lamp May we send you a copy?

A most efficient appliance for making local applications of heat It combines the essentials of many expensive therapeutic lamps in one simple effective appliance

(Continued from page 118—adv xvi)

feasible to predicate prosecution for practicing medicine without a license, on failure to register under this measure, should it become a law Prosecutions will, as heretofore, be based on the Medical Practice Act The only right to practice medicine under the Medical Practice Act stands temporarily suspended when a physician fails to register annually He can cure such discrepancy at any moment by registering, which must stop any prosecution incident to failure to thus register

Manifestly, if any physician who has thus failed to register has no right to practice medicine under the Medical Practice Act, registering will not extend to him that right In fact, the measure specifically so states It is felt that the two laws have been coordinated in this respect with absolute safety to the physician who is legally practicing medicine It is also felt that an additional law, such as this, will make the Medical Practice Act more readily enforcible and more easily administered Certainly there will be an established, accepted state agency for the enforcement of the Medical Practice Act, and with the power and the means to succeed in its endeavors

HOME FOR THE MASSACHUSETTS MEDICAL SOCIETY

A campaign for securing a home for the Massachusetts Medical Society and the Boston Medical Library is described in the following abstracts from the November first issue of the *New England Journal of Medicine*—EDITOR'S NOTE

The Boston Medical Library and the Massachusetts Medical Society have united in a $650,000 campaign to provide and maintain the long-desired addition to the Library

A campaign, begun last spring among the members of the Massachusetts Medical Society to raise funds for its headquarters and for the offices of the *New England Journal of Medicine*, was suspended for a time when it appeared possible that the two organizations might unite in an effort to secure funds which would provide for the needs of both under one roof

The Massachusetts Medical Society will have its headquarters and the *New England Journal of Medicine* its offices in the new addition A new reading room, individual study rooms and added stack rooms which are now much needed will be provided

The present campaign is the first public appeal of the Library in the 52 years which have elapsed since its founding by Dr Oliver Wendell Holmes and a group of physicians of whom Dr William L Richardson is the sole survivor It first occupied two rooms at 5 Hamilton Place Members of the young library association deposited their private collections in order that they might be

CONSTIPATION

In the Breast-Fed Infant

HORLICK'S MALTED MILK has long been used with success in the prevention and correction of constipation among breast-fed infants

For the Nursing Mother—

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's—the Original—Malted Milk, knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby—

Supplementary feedings of "Horlick's" almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation

ANNUAL REGISTRATION OF PHYSICIANS IN TEXAS

The physicians of Texas are planning a bill for the annual registration of physicians modelled after the law of New York State, p 105 The following abstracts from an editorial in the December *Texas State Journal of Medicine* give the general plan of the bill—Editor's Note

The legislative committee of the State Medical Association has prepared, as per instructions of the House of Delegates, a measure which if enacted into law will place in operation the plan of annual registration of practicing physicians, as per the discussion which has been in progress in our midst for the past several years

Under this measure, all persons engaged in the practice of medicine in this state, as defined in the present Medical Practice Act, will be required to register with the State Board of Medical Examiners by the first of January of each year, and pay a registration fee of $2 00

If any person required to register fails to do so within sixty days, his license to practice medicine in the State of Texas stands forfeited, and he cannot continue in the practice of medicine until he has registered Should he continue to practice in the fact of his failure to so register, he may be prosecuted under the Medical Practice Act, for practicing medicine without authority of law However, it is definitely and affirmatively provided that the forfeited license shall be restored immediately upon the filing of the registration blank and payment of the accumulated fees, plus an addition fee of $1 00, the sum calculated as being necessary to pay the additional expense of collection It will be noted that there is here no jeopardy to the right of any physician to continue to practice medicine in this state, once he has been extended that right and the same never having been cancelled by due process of law

All funds resulting from the collection of the registration fees, are placed in the state treasury, subject to voucher by the State Board of Medical Examiners, under regulations anticipated by the measure and compiled by the State Board of Medical Examiners This money may be used in paying the salary of a permanent secretary for the board, and for the maintenance of a central office, with the necessary inspectors, legal service and the like, incident to the enforcement of the law and its administration in general The fees coming to the board as the result of its activities in examining and licensing physicians, will continue to go to its members, as heretofore, as their compensation, the necessary expenses of administering that part of the operation of the law having been taken from the amount thus received before the distribution of the balance

The legislative committee did not deem it

(*Continued on page* 119—*adv xvni*)

ENFORCING THE MEDICAL LAWS OF IOWA

It is interesting to read what the physicians of Iowa say about the enforcement of the medical laws of the State The December issue of the *Journal of Iowa State Medical Society* says

"The fundamental basis on which the treatment of the sick is conducted and public health work is being done is on a lower basis in Iowa than it is in any other state in the Union

"You may be surprised to learn that the Iowa State Department of Health is relatively the most inadequately supported department of its kind in this country Your State Department of Health receives for health work, a smaller per capita appropriation than does the same department of every other state in the Union According to figures prepared by the International Health Board (see accompanying chart), the Iowa Department receives for health work, an annual per capita appropriation of only two and one-half cents, whereas, the average for the State Health Departments of the country is nearly nine cents The annual per capita appropriation for the work of licensing physicians and carrying out the 'medical practice act' is only one-fifth of one cent—also the lowest, we believe, of any state in the Union

"Now what are the remedies for this unfortunate situation? There are many things that should be done I have space to mention at this time only one"

The editor then discusses the machinery for law enforcement, and compares it with that in New York State The Iowa editor says

"The present law places the machinery of law enforcement in the office of the attorney general The attorney general informs us, however, that he does not have the necessary assistance to secure the proper evidence in case complaint is made and he will not, of course, start action without proper evidence Those who complain usually have difficulty in securing evidence in a form satisfactory to the attorney general Furthermore, they claim —and very properly so—that it is the business of the state to secure such evidence Even if evidence in proper form is secured, the attorney general informs us that he does not have sufficient assistance to prosecute all of the cases for which evidence has been presented It is a rather strange thing that the state will make provision for the licensing of professional people, insist on certain qualifications and spend considerable state money as it does in some of these professions, and then after licensing them does not make provision for the reasonable enforcement of the law which

accessible to all physicians of the city In 1878 the Library was forced by congestion to move to larger quarters at 19 Boylston Place

In 1900 the quarters were again overcrowded and a sum was raised among physicians to erect the present building at No 8, the Fenway In this building there is a stack capacity of 50,000 volumes, but the Library's collection has increased to 150,000 volumes besides 100,000 pamphlets Reading and assembly rooms have necessarily been used as temporary stack rooms, and books and pamphlets for which there is no shelf space are piled in basement and corridors Several valuable collections have been placed in storage warehouse on account of lack of room The proposed addition will increase the stack capacity to 300,000 volumes, providing for the present overflow and the average increase of 4,000 volumes a year for the next thirty years

The Massachusetts Medical Society, founded in 1781, is the oldest state medical society in America It now has a membership of about 4,500

(The issue of November 22 contains an account of a large meeting to promote the campaign)

ANTIVIVISECTION IN ILLINOIS

The December issue of the Illinois Medical Journal has the following editorial on a proposed antivivisection bill

"According to press reports, Senator Thomas J Courtney, recent Democratic candidate for attorney general of Illinois, will introduce in the next session of the legislature for the antivivisection society which is known as an Antivivisection Bill

"The people of Illinois therefor will be confronted at the forthcoming session of the Illinois Legislature with a measure for the prevention of animal experimentation This sort of legislation strikes at the very foundation of research work Physicians do not need to be convinced or even reminded of the benefit to medicine for the use of animals in experimental work, but they do need to have it forcibly impressed upon them that if they take no cognizance of this movement the public may believe the untruthful statements and extravagant illustrations in the propaganda that will be distributed by the sponsors of the bill

"Aside from any organized effort which the profession might make it is possible for physicians in their daily contact to give the public much information as to the truth about vivisection In our next issue we will furnish the profession with detailed information of what animal experimentation has done to save human life and lessen morbidity"

(Continued from page 122—adv xx)

cal institutions of the city, in order that she might be certain that the dog was not being 'vivisected'

"Because at times the activities of the organized antivivisectionists have brought into existence ordinances and laws, based on what might be called at best only kindly or maudlin sentiment but which once on the statute books become inimical factors against the progress of medical science and of human welfare, this example of how antivivisectionists pursue their work, is here given space

"The statements in the post card speak for themselves It is left to our readers to form their own opinions of what they would call the persons sending such stuff"

MEDICAL FOLKLORE IN VIRGINIA

The *Virginia Medical Monthly* for December carries the following editorial appeal

"Members of the Medical Society of Virginia, who may have knowledge of beliefs of diseases and folklore remedies of the past, will materially assist the Committee on History of Medicine in Virginia of our State Society, if they will reduce to writing any of these and send same to Dr Wyndham B Blanton, Richmond, chairman. Since the special circular sent with the November number of the *Virginia Medical Monthly*, some responses to the request have been received, but it is certain that much remains to be unearthed and to be put into writing It is hoped that members will take interest in the collection of this material in old Virginia, which has long since been permitted to remain a matter of word of mouth.

"Folk medicine is a chapter of medical history rich in interest, if not in scientific value, and it should be preserved in writing if possible

"In old days on the Virginia plantations, and in rural communities, in remote sections of the state, among the slaves and negro 'grannies,' there developed a sort of medical practice that passed by word of mouth from one to another through the years These 'old sayings' and trifling medical folklore merit collection and recording before time and lack of a need for such in modern life cause them to be lost Physicians have heard many of these 'beliefs' and 'practices' and it is only necessary to take the time to reduce the same to writing and to forward them to the committee on history"

MALPRACTICE SUITS IN WISCONSIN

The December issue of the *Wisconsin Medical Journal* contains a concise article on the prevention of malpractice suits by Mr J G Crown-

Plaza 7379

Westchester Institute for Physical-Therapy

233 South Second Avenue
Mount Vernon, N. Y.
Telephone, Oakwood 1643-1644

Conducted according to the ethics of the medical profession

Patients are accepted only upon the recommendation of their physicians

Equipped for giving the following forms of physical-therapy

Baking Treatment	**Hydrotherapy**
Diathermy	**Quartz Lamp**
Massage	**Thermal-Light**
Vibro-Massage and Medical Reconstruction Work	**Infra Red**
	High Colonic Irrigations

Morse Wave Currents

Treatment given by graduate technician

Rooms available for resident patients

R N in charge

Attention is given to special diets as ordered by their physicians

A physician is available for the resident cases whenever their attending physician is unable to visit the patient

Regular reports of progress are sent to the physician who refers the patient.

VISITING PHYSICIANS ARE ALWAYS WELCOME

aims not only to protect the members of the profession from unfair competition, but chiefly to protect the people from incompetent and illegitimate practitioners, many of whom are pure charlatans, preying on the public

"The members of the several professions pay a certain sum for their license and a certain annual renewal fee to keep their license in force These are obviously intended to be used for the administration of the law pertaining to these professions They are not, we believe, intended to be a source of revenue Nevertheless, for the year ending June 30, 1928, the receipts from examination and renewal of licenses from physicians amounted to $8,228, whereas, the expenditures in the behalf of the administration of the Medical Practice Act was only $4,643 47

"It will thus be seen that there was turned into the state treasury as unexpended receipts the sum of $3,584 53—which sum could, with great benefit to the people of the state, have been used for better administration—more especially law enforcement of the Medical Practice Act"

ANTIVIVISECTION IN CALIFORNIA

An example of antivivisection propaganda, as related in the December issue of *California and Western Medicine,* is of special interest to New York physicians because it involves the New York Antivivisection Society The journal says

"A friend lost a dog The animal was not pedigreed, but because of its affection and temperament, had become very dear to the husband and wife, who were in well-to-do circumstances The dog, a wirehaired terrier, disappeared, was advertised for in the papers and police bulletins, and a reward of one hundred dollars was offered for the return of the animal This advertisement brought to the wife a post card dated Los Angeles, on the reverse side of which was printed the following gem

"'New York Antivivisection Society
'1860 Broadway, New York City'

"'If you have not already found the dog advertised we suggest that you search in the nearest medical laboratory, as animals are often stolen and sold for experimental purposes Do not let them bluff you off, but be persistent

"'You may be a believer in vivisection, in which case you would be as willing to have your own dog sacrificed as another, but, if not, you will justly wish to save your dog from torture'

"This post card was brought to the writer by the wife of his friend, with the request for aid in obtaining permission to go through the medi-

(*Continued from page 124—adv xxii*)

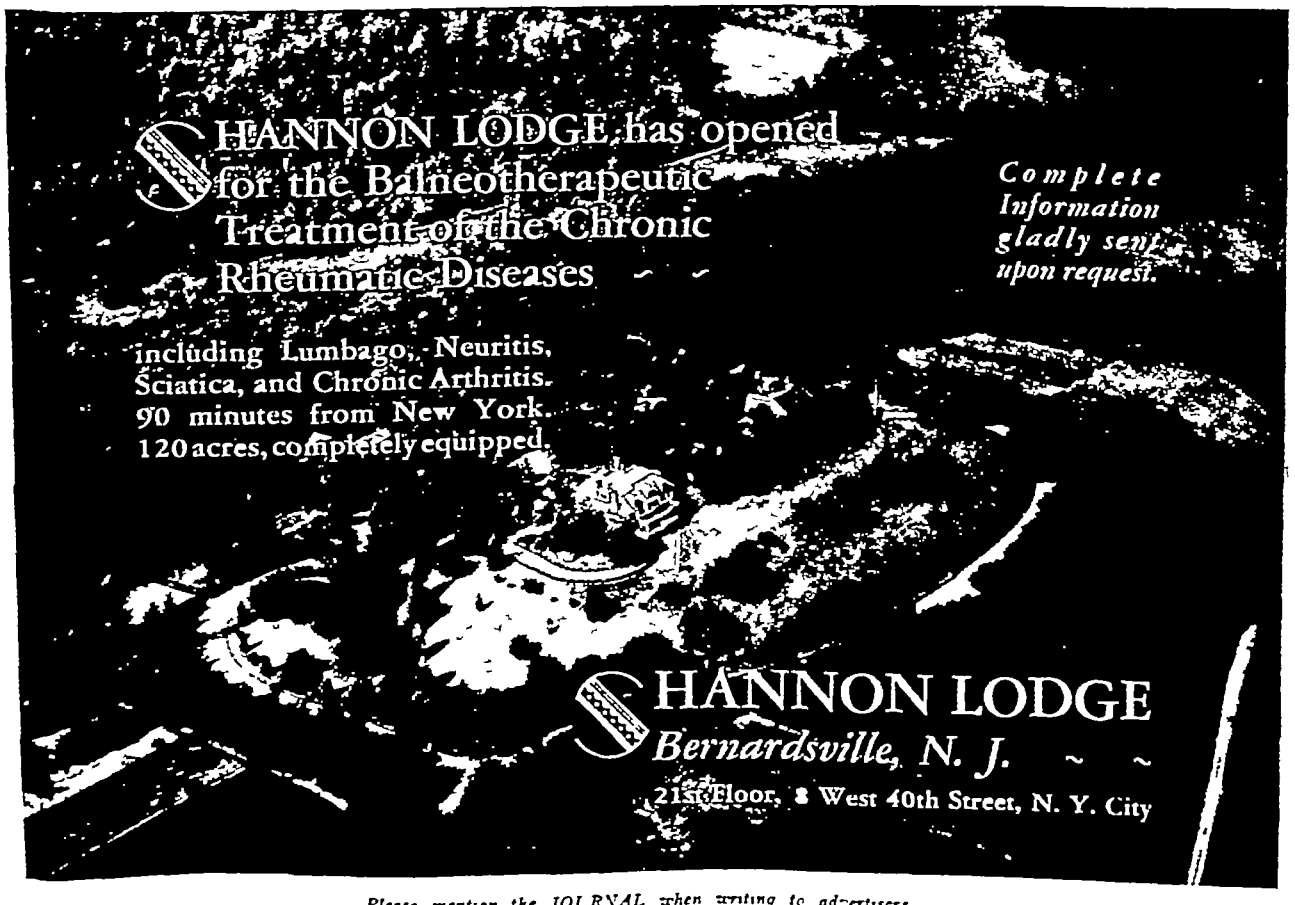
tain period of time has elapsed after the alleged malpractice took place In Wisconsin the time stated is two years When a patient does not pay his bill, many physicians threaten him with suit or turn the bill over to a collection agency who may start suit in the physician's name

"It seems hardly necessary to state that in full records lies your greatest protection Such records, made at the time, are the best evidence in court of conditions you found and treatment you advised If your patient is not following your advice be sure to make note of that at the time.

"If your operative reports are typed, read them carefully and sign your name in full Do not just initial typed records Never sign hospital operative records in blank to accommodate the hospital

"Assuming that some day you are given summons in a suit, or a suit is threatened, these pointers may be helpful

"1 Report the suit or threat to your insurance company (and to the Society if you carry defense) at once



"2 You may be invited to call on the patient's attorney to 'avoid' a suit. Let your attorney do that for you

"3 Tell your own attorney all the facts even though some do not reflect credit on your judgment. He can not help you if you 'hold out' on him

"4 Do not be offended if a friend of yours is going to testify for the plaintiff Better a friend who will give you a square deal than a quack whose testimony is purchasable

"5 Be careful of too positive statements Tell what you know in terms the jury can understand and admit that you do not know everything in medicine. When the plaintiff's attorney gets you to making one wholly positive statement after another, he is soon apt to discredit your entire testimony by showing that authorities do not agree with some two or three statements and q e d—you are all wrong

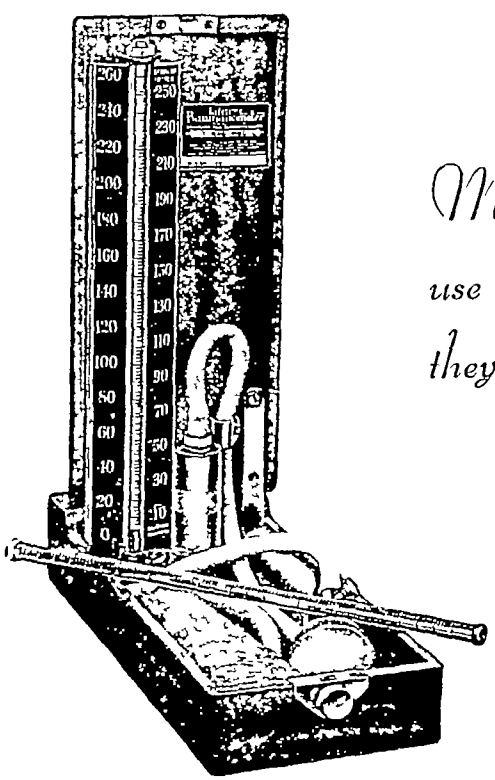
"Every malpractice action undermines the confidence of the public in all physicians, and it is said that a dozen new suits are commenced based upon the publicity of a new case You are your brother's keeper in maintaining a justified public confidence. Let no act of yours lead to a betrayal of that trust"

(Continued from page 123—adv xxi)

hart, the lay secretary of the State Medical Society A malpractice suit is a legal matter of which a layman can judge better than a physician What Mr Crownhart says is therefore of special interest to physicians Some of his points are as follows

"It is nothing less than folly for the physician to make unnecessary positive statements when it is but human to err and particularly easy in diagnosis or treatment in the broad field of human ills When you say 'It is nothing but a cold Take these, go back to work and forget it' and subsequently it is found that the patient had incipient tuberculosis all the time he saw you, he is sure to at least resent your too positive attitude if nothing more

"Few of the laity understand that an exact anatomical alignment in a fracture is not usual or necessary, that you are trying to attain it but that you are primarily interested in the functional result When this is not explained and the patient subsequently sees an x-ray showing only a fair anatomical result, who is to blame him if he thinks he has had poor treatment?



"Physicians that promise quick results and fail to attain them frequently find their patient is presently someone's else now

"Attorneys frequently tell us that street corner advice is worth just what one pays for it, yet it occurs with a fair degree of frequency that an attorney will ask a physician for street corner advice on a supposed course of treatment Be careful what you say for he may be trying to arrive at conclusions whether a client has a real malpractice case What he tells you will likely be but one side of the case and when all is known to you, your first opinion may be reversed

"In these days of compensation insurance a new cause for misunderstandings between physicians exists It is an everyday occurrence for the insurance carrier to demand that 'their physician' sees the case I have seen reports written by such physicians scoring the acts of the family physician The insurance company may show this report to the claimant to show how his period of recovery was prolonged by faults of the family physician, explaining that the company could hardly be expected to pay for that period

"In most states the law provides that a physician may not be sued for malpractice if a cer-

VITAMINS IN SHELL-FISH

The *Journal of the American Medical Association* for July 28 discusses shell-fish editorially from the standpoint of their editorial content, and says

"Recent studies in the Bureau of Chemistry and Soils in Washington have shown that these shell-fish are comparatively rich in the accessory food factors, but present some rather surprising differences For instance, while oysters are rich in the vitamin B complex, neither hard nor soft clams contain it in appreciable quantities Again, vitamin A is found in oysters in larger concentration than in clams The latter on the other hand, are richer in the antirachitic potency than are oysters It has previously been shown that oysters contain the antiscorbutic vitamin in abundance The foregoing facts furnish a justification if, indeed, any is required, for eating these delectible shell-fish It is interesting from a scientific point of view, that the high antirachitic potency of the edible portions of these food animals is consistent with the facts known of other marine forms in this regard, notably the potency of the fish liver oils"

MEDICAL PUBLICITY IN NEW JERSEY

The November issue of the *Journal of the Medical Society of New Jersey*, in reporting the October meeting of the Bergen County Medical Society, says

"Dr S T Snedecor, for the Public Relations Committee, outlined the plans which they had formed The public education campaign will have two parts The first will be indirect advertising in the form of bi-weekly releases to all of the county newspapers, on general medical topics These will be published under such a title as Bergen County Medical Society" From various other societies, particularly those of Toledo, Minnesota and Wisconsin, we have obtained a considerable number of suitable topics The second part will be direct paid advertisements They are awaiting the formation of the details of copy and circulation from Mr V C Pratt who has had a large experience in general medical advertising We hope to be able to start this campaign in about a month with complete copy prepared to carry on for a period of six months This report was approved"

AUTOPSIES UPON PHYSICIANS

The December number of *Colorado Medicine*, page 416, records the following resolution adopted by the House of Delegates on September 12—*Editor's note*

WHEREAS popular prejudice against post mortem examinations is an obstacle to medical progress and

WHEREAS the laity properly expects leadership in health programs from the physician, therefore be it

RESOLVED by the House of Delegates of the Colorado State Medical Society that we urge upon our membership the advisability of fore-ordering post mortems upon their own bodies to the end that we may with better grace ask for post mortems from the laity Be it further

RESOLVED that a copy of this resolution be forwarded to our constituent County Societies with a request for official action

The Associated Physicians of Long Island adopted a similar resolution some ten or more years ago, but the idea died of neglect rather than opposition

Poland Water

because of its purity and bland diuretic properties is always a desirable adjunct in the sick room

Our records prove that Poland Water will often be taken freely when ordinary water is refused

THE SIGNIFICANCE OF VARIOUS AND LABORATORY FACTORS IN THE DIAGNOSIS OF PEPTIC ULCER*

By T GRIER MILLER, M.D, PHILADELPHIA, PA.

From the Gastro Intestinal Clinic of the Hospital of the University of Pennsylvania

PEPTIC ULCER, having no pathognomonic signs, must be diagnosed usually on the basis of the patient's complaints, of the special physical signs that he presents and of the results obtained by gastric analysis and by roentgenological study The personality, the general make-up, the sex and the age of the individual also are matters that must be taken into consideration The significance of these several groups of data varies, but usually all are factors of more or less value in the final diagnosis Some idea of their relative importance may be gained by a determination of the frequency with which the specific abnormalities present themselves in a miscellaneous series of gastric and duodenal ulcer cases such as is encountered over a period of years in our general hospitals This paper consists of an attempt to pick out and evaluate the points of diagnostic importance discovered by the writer, Pendergrass and Andrews[1] in an intensive study of the records of the 279 such patients who have been operated upon in the Hospital of the University of Pennsylvania during the past ten years Particular attention in that investigation was given to a selected group of 36 gastric and 100 duodenal cases on which the records were very complete, but all were used in the determination of the age and sex incidence, of the duration of symptoms and of the frequency of certain complications Each case was proved and the exact nature and location of the lesion was demonstrated Because of the brief time available I shall limit myself largely to the findings in that study, and in the main shall refer to peptic ulcer, irrespective of its localization, pointing out the difficulty, except by roentgenological procedures, of deciding before operation whether the ulcer is gastric or duodenal

The existence of a special physical type of individual that predisposes to peptic ulcer, as demonstrated by Draper, Dunn and Seegal[2], is fully appreciated, but our data on this aspect of the disease, while confirmatory of their findings, were insufficient for analysis The sex and age incidence, however, were carefully studied, and it was disclosed that at the time of diagnosis peptic ulcer, whether gastric or duodenal, is essentially a disease of men in the middle period of life Eighty-six per cent of our cases were males, and at the time of admission to the hospital 80 per cent of the entire group, male and female, were between 30 and 60 years of age, the largest number occurring in the fifth decade This represents the age at the time of admission to the hospital, but even when the age for the onset of symptoms was determined, it was found that 52 per cent of the gastric cases fell into the fourth and fifth decades and that 64 per cent of the duodenal cases fell into the third and fourth with 18 per cent in the fifth The somewhat more advanced average age for the gastric cases is interesting in view of the common statement in textbooks that the gastric cases occur earlier in life than the duodenal ones The age variation for sex was too slight to be of practical importance, though the women were older in each group (gastric and duodenal) No woman under 40 was operated upon for ulcer in our hospital during the ten year period

The symptomatology of peptic ulcer, particularly of duodenal ulcer, is commonly regarded as of great diagnostic value, and yet all clinicians have encountered patients with a typical history who at operation presented no such lesion Under such circumstances gastric or duodenal adhesions, gall bladder disease or even appendicitis may be found, or indeed no organic disease Gray[3], especially, has emphasized this point, finding no roentgen ray evidence of ulcer in 32 per cent of 250 patients having a duodenal ulcer symptom complex. Some of these symptom complexes, he claims, were due to tobacco smoking, others to gall bladder disease, chronic appendicitis and constitutional disturbances Although his cases, in most instances, were not proved negative for ulcer by operation, and his high percentage cannot be accepted unreservedly, it is certain that the duodenal symptom complex does not in-

monly results from spastic or organic pyloric obstruction, and was demonstrated in from 60 to 70 per cent of our cases having simple test meals This percentage of cases with retention was confirmed by the fluoroscopic finding of a gastric residue six hours after the barium meal An ascending and sustained curve of acidity, based on fractional gastric analysis, is also considered of some value in the diagnosis of ulcer, particularly duodenal ulcer, but it occurs in other conditions leading to a failure of the duodenal regurgitant mechanism, and so can be looked upon as suggestive of ulcer only when associated with a typical history and the usual roentgenological signs

The factors thus far considered, with the exception of fractional gastric analysis, have been available to the profession for many decades, and yet until the comparatively recent development of satisfactory roentgen ray technique for the study of peptic ulcer, this disease was poorly diagnosed The roentgenologists, therefore, must be given the credit for our present high degree of accuracy in diagnosis It is not possible for me to state how often a false positive diagnosis has been made on the basis of the roentgen ray findings in our hospital, but of the cases proved at operation to have ulcer, 94 per cent of the gastric ones and 88 per cent of the duodenal ones had been correctly diagnosed by our roentgenologists (H K. Pancoast and E P Pendergrass) These workers advocate and routinely practice a combined ten to fifteen minute fluoroscopic study with serial film exposures They consider neither procedure in itself sufficient, for in a fair percentage of cases the fluoroscopic findings are not typical and a defect alone may be due to other lesions, particularly to adhesions When, however, in addition to a constant defect, the fluoroscopic phenomena of ulcer (gastric or duodenal) are present, the diagnosis is almost certain

Differentiation Between Gastric and Duodenal Ulcer

Some years ago it was customary to diagnose a case with peptic ulcer symptoms as having gastric ulcer, now the tendency is to diagnose such a case as one of duodenal ulcer It is possible, as Dr Thomas McCrae has suggested to me, that there once were many young women with gastric ulcer, just as there were cases of chlorosis, and that for some unknown reason these do not now occur Certainly autopsy reports, even those compiled from records of the past quarter century, show a predominence of gastric over duodenal lesions The surgical statistics of recent years, however, including our own, show that duodenal ulcer is the more common, in the ratio of about 4 1 Roentgenological records indicate even a greater preponderance of duodenal lesions, Sutherland[4] of the Mayo Clinic finding 9 1 This latter method of determining the relative clinical frequency is doubtless the most accurate for it most nearly represents the total number of persons with suggestive symptoms The lower surgical ratio is to be accounted or by the fact that operation is not so commonly performed in the instance of duodenal ulcer It may be said, therefore, that for any individual having ulcer symptoms the probabilities are about 9 to 1 that the lesion is on the duodenal side of the pylorus

Beyond this there is little justification, except on the basis of the roentgen ray examination, for a statement as to localization The age and the sex incidence are practically the same, although our data show a tendency for the patients with gastric ulcer to be older The symptoms may occasionally give a hint as to which side of the pylorus is involved in our series we found a burning type of pain more common in the gastric cases, a gnawing sensation more common in the duodenal, the interval between the taking of food and the onset of pain longer in the duodenal, and the presence of pain in the left lower anterior chest more often associated with ulcers of the lesser curvature of the stomach None of these findings, however, was of sufficient frequency to be more than merely suggestive. It has been said that pain referred to the back favors a localization along the posterior wall of the stomach but we found an equal percentage of duodenal cases with such pain reference This depends upon penetration into or adhesions to posterior wall structures, and such adhesions are not uncommon in duodenal ulcer Ulcers of the second portion of the duodenum also give back pain Gastric hemorrhage and the complications of perforation and pyloric stenosis occur in each group and with a more or less equal degree of frequency

The gastric analysis is of less help in differentiation than was formerly supposed It has been pointed out already that, with the exception of achlorhydria which occurs rarely in gastric ulcer, any secretory response may be found in either group and that gastric retention, demonstrable by a simple test meal study, occurs with almost equal frequency Thus, until we consider the roentgen ray findings, the localization of an ulcer to the stomach or to the duodenum must be based almost entirely on the probable frequency of occurrence When so-called pyloric stenosis has developed the localization of the original ulcer often is made impossible, even by roentgen ray study, though one may be sure under such circumstances that the lesion is in the neighborhood of the pylorus

The skilled roentgenologist, however, is able usually, except in the instance of pyloric stenosis, to state quite accurately where the lesion is This is accomplished by his determination of a constant filling defect in the films and by his observance fluoroscopically of certain abnormal motor phenomena

When stenosis is present he can determine this also, but our study shows that it is impossible usually to state whether the obstruction is exactly

variably mean duodenal ulcer to the extent that Moynihan would have us believe On the other hand, and perhaps with equal frequency, peptic ulcer may be present in the absence of a suggestive history, indeed some such lesions perforate before a symptom has occurred In spite of these reservations it remains true that a characteristic history is one of the most important factors in the diagnosis of ulcer Such a history usually includes a story of prolonged attacks of pain, and sometimes of vomiting, gaseous eructations and nausea, alternating with periods free of symptoms that last from weeks to months Of the symptoms, pain is by far the most important and, with the exception of the vomiting of gross blood, is the only one that in itself is of diagnostic value It was localized in the epigastrium in 90 per cent of our series, was of a dull and gnawing or sharp and severe nature in most instances, of a burning character in a third of the gastric cases, came on in a fixed relation to meals in 70 to 80 per cent, and was relieved by the ingestion of food in 50 per cent, by the administration of alkalies in 38 per cent and by vomiting in 25 per cent Pain with such features, and particularly when it occurs periodically, no matter what the other symptoms, always suggests ulcer as the probable diagnosis, a diagnosis to be abandoned only after the most careful study

Vomiting occurred in three-fourths of our cases, but unless the vomitus is bloody or contains food material eaten many hours before, it cannot be regarded as of significance, since vomiting is frequently encountered in other gastric and even extragastric conditions When the vomitus is bloody, as it was in more than a fifth of our series, ulcer is strongly suggested, and when it contains material eaten more than twelve hours previously, the complication of pyloric stenosis must be considered Gaseous eructations, an impaired appetite and sluggishness of the bowels occur frequently, but are so common in hospital cases generally that no diagnostic significance can be attached to any of these Periodicity of symptoms needs further emphasis it occurred in more than 60 per cent of our cases, and, although it may be present in the absence of ulcer, should direct attention first of all to that condition When, therefore, a patient gives a history of epigastric distress of characteristic type, of bloody vomiting and, in addition, of prolonged periods of relief from all symptoms, the diagnosis of ulcer is rendered extremely probable

The physical examination of the patient usually adds little to the probability of ulcer unless a complication has occurred, in the event of perforation or of pyloric stenosis it is of the greatest value Aside from such developments the only frequent finding is a definitely localized spot of tenderness, usually just above the umbilicus and slightly to one side or the other of the midline This was present in about one-third of our cases While such soreness may occur in association with other lesions, such as cholecystitis and adhesions to the anterior abdominal wall, it is usually, under such circumstances, more diffuse in ulcer the patient himself can ordinarily indicate the exact spot and cover it with the end of a single finger Such a single small spot of tenderness rarely, if ever, occurs in a functional gastric disturbance, and when present, together with a typical history, is a factor adding much to the probability of ulcer A mass is occasionally felt and should not always be looked upon as evidence of a malignant lesion it occurred in 8 per cent of our gastric cases and in 4 per cent of the duodenal ones, being due sometimes to pyloric spasm and sometimes to an indurated ulcer with adhesions Visible peristalsis always suggests the complication of pyloric stenosis, but in itself gives no clue as to the primary lesion. Muscular rigidity, when generalized and board-like and associated with acute pain and tenderness, no matter what the history, suggests perforation, when localized, it may be due only to a penetrating lesion with peritoneal inflammatory reaction None of these findings, however, with the exception of generalized tenderness and rigidity, is helpful in the exact diagnosis of ulcer unless it is associated with a typical history or suggestive laboratory findings

This brings us to a consideration of the gastric analysis Peptic ulcer probably never develops in the absence of free hydrochloric acid in the stomach contents, but at the time of diagnostic study some gastric ulcer cases show an achlorhydria, duodenal ulcers rarely, if ever, do Most cases show high acidity or what is often called hyperchlorhydria The latter designation is open to question, however, since it is now fully appreciated that some presumably normal persons present a similarly high gastric acidity Half of our gastric cases, taking the highest figures when fractional analyses were done, showed figures for the free hydrochloric acid that are commonly regarded as normal and 41 per cent had what has by some been considered hyperchlorhydria, the duodenal cases on the whole tended to show slightly higher figures It is important to note, however, that 59 per cent of the gastric cases and 31 per cent of the duodenal ones gave figures that were within or below the accepted normal range It seems hardly justifiable, therefore, to attribute any special diagnostic significance to the gastric acidity findings alone high figures were far less frequent in our cases than was a typical pain history This point is made stronger when it is considered that pain always indicates some disturbance, organic or functional, whereas high gastric acidity frequently occurs in the absence of any symptoms and of any demonstrable disease What is perhaps of greater significance is the determination of gastric retention, indicated by the recovery of 100 c c or more of gastric contents one hour after an Ewald meal Such retention com-

used There have been severe reactions, local and general, but only five with symptoms sufficiently alarming as to demand hospital care following any injection The above statement does not include deaths due to a terminal broncho-pneumonia in very weak infants with marked evidence of syphilis

The first death was that of a girl, age ten years, who had a chronic swelling of both knee joints for eight years She had been to many physicians and clinics and had been studied pretty thoroughly, including negative Wassermanns, however without a positive diagnosis and with no improvement of symptoms She was sent to me by an Orthopedic Specialist, who had congenital syphilis in mind as a diagnosis, and, concurring with him, I decided to do a provocative test and gave her 0 2 gram, neosalvarsan, intravenously, and one week later, 0 3 gram From the first injection there was not the slightest reaction, local or general The mother was told to bring her one week later for a Wassermann, and she left my office with no ill effects Ten hours after the second injection she began to vomit. The family physician was called in and he used palliative measures but the vomiting continued He called me on the second day of the vomiting She seemed comfortable except for the incessant vomiting and a coarse tremor of hands and arms, with no fever and a normal pulse Glucose and fluids by rectum were given, but the next day she had not improved and when hospitalization was advised another consultant was called and I did not see her again The child died three days later, or six days after the last neosalvarsan The consultant told me later that she had cerebral edema, due to arsenical poisoning The urine was normal and the spinal puncture revealed nothing A blood chemistry was not done

The second death was that of a seven year old boy with definite congenital syphilis tarda He received 0 3 gram, neosalvarsan, intravenously, at the clinic and one week later, having had no reaction from the previous, 0 35 gram He began to vomit ten to twelve hours later, which continued until the following morning when he began twitching The vomiting and twitching continued all day and by four p m the latter had become convulsive in character An ambulance was called and he was brought into the hospital He was vomiting continuously between convulsive seizures and had passed no urine for eighteen hours Immediate measures were resorted to for controlling the clonic convulsions, also 0 3 gram of sodium thiosulphate was injected intravenously His stomach was lavaged with two percent bicarbonate of soda solution He was catheterized and fifty cubic centimeters of straw colored urine was obtained which was negative except for a faint trace of albumin and sugar A spinal puncture was done and was found negative from every standpoint While preparations were being made to get a blood chemistry and administer intravenous glucose, he suddenly expired at eleven-thirty p m on the day of admittance to hospital The autopsy revealed, in brief, central necrosis in the liver and a few terminal infiltrations of the lung, the brain, kidneys, heart, spleen, lymph glands and suprarenals were normal

A twelve year old girl was admitted to the hospital October 20, 1927 with a complaint of vomiting everything she ate since October 13th, seven hours after receiving 0 4 gram of neosalvarsan, intravenously, at the clinic She was a congenital syphilitic with a persistently positive Wassermann, in spite of vigorous treatment since the early part of 1924, at which time she was sent to me with a very severe bilateral interstitial keratitis Since that time she has had three full courses of neosalvarsan, intravenously, and mercury intramuscularly, and two full courses of sulpharsphenamine and mercury, both intramuscularly, with intervals of one to three months between courses The smallest amount of arsenical that she received at one time was 0 3 gram and the maximum, 0 7 gram She had not shown a severe reaction before, and this one started after the second injection of neosalvarsan She received 0 3 gram September 29 1927 and 0 4 gram October 13, 1927 Her last Wassermann was one plus September 23, 1927 She had received sulpharsphenamine and mercury since February 26, 1925, having had on February 19, 1925, her last neosalvarsan (0 6 gram)

The family physician treated her one week before sending her to the hospital He told me he gave bismuth subcarbonate and told the mother to force fluids especially orange and lemon drinks, but she had received no alkaline drugs He said owing to her vomiting and persistent abdominal pain he at first thought it appendicitis

Upon arriving at the hospital her positive physical findings were a moderately rigid neck, positive bilateral Koenig, bilateral ankle clonus, bilateral increased knee jerks, a coarse tremor of hands and feet, dullness mentally but not comatose There were in addition a slight opacity of

at the pylorus or within an inch beyond it In 23 of our cases diagnosed pyloric stenosis or gastroduodenal ulcer the lesion at operation was found to be on the gastric side three times, to involve the pyloric ring itself three times, and to be in the duodenum within a distance of one inch of the pylorus seventeen times Though this exact localization is not important diagnostically, since stenosis in itself is an entity justifying operation, it should be appreciated that the expression "pyloric stenosis" applies to stenosis in the region of the pylorus, usually on the duodenal side

Conclusions

This review of the data accumulated on 279 proved cases of peptic ulcer and reported in detail elsewhere leads to the following conclusions

(1) That gastric and duodenal ulcer have essentially the same age and sex incidence, the same symptomatology and physical signs and the same gastric analysis findings,

(2) That the differentiation between the two groups of cases can be made with certainty only by roentgenological examination, including both fluoroscopic observation and serial film exposures,

(3) That pyloric stenosis occurs as a complication in both varieties of ulcer and as such can usually be diagnosed by the clinical as well as the roentgenological findings, but that no means are available for determining with certainty in many instances the exact location of the stenosis in relation to the pyloric ring or the situation of the ulcer that produced it,

(4) That the roentgenological examination is of greatest help in the diagnosis, being correct in approximately 90 per cent of our proved cases, and that the history is of next greatest importance, the physical examination and the gastric analysis being of only secondary value

ARSENICAL REACTIONS IN CONGENITAL SYPHILIS COMPLICATED WITH ALKALOSIS*

By THURMAN B GIVAN, M D, BROOKLYN, N Y
From the Department of Pediatrics, Long Island College Hospital, Brooklyn, N Y

THERE is a certain amount of risk entailed in the modern treatment of syphilis However, the better results obtained far overbalance the occasional untoward symptoms In order to combat the devastating effects of the spirochoete, more or less powerful drugs are used, drugs which have a tendency at times to accumulate in certain vital organs of the body and in a few sensitive individuals produce toxic effects Arsenic, the most powerful of these drugs, is the one I am dealing with in this paper Hence in administering arsenic in one of the usual forms, as, for instance, arsphenamine, neoarsphenamine or sulpharsphenamine, the operator must keep in mind toxic developments which may be classified under the following heads

(1) Nitritoid crisis, so-called because of the close resemblance of the symptoms to those produced by amyl nitrite poisoning, flushed face, choking cough, a subjective sense of impending death, many times accompanied by vomiting This occurs during or soon after the intravenous use of the drug and may be very alarming but not fatal, if adrenalin chlorid is given promptly by hypodermic

(2) Herxheimer reaction, occurring usually six to twelve hours after an injection although it may be delayed for days, as in syphilis of the central nervous system into which the drug does not enter at once It is now thought to be due to a flare-up of the lesion or lesions with varying degrees of general symptoms It is produced almost invariably by the first injection and probably the immediate signs are brought on by the massive destruction of spirochoetes with a resultant toxemia It is, then, a therapeutic shock Many other phases of the Herxheimer can not be discussed at this time

(3) Familial idiosyncrasy to arsenic, a condition clearly demonstrated in two families treated in my clinics, and in the reports of many others treating syphilis

(4) A toxic state with a syndrome apparently not due to any of the above causes, and it is with this that the present report deals

During the past seven years of handling congenital syphilitics on a large scale during which time many thousands of injections of various drugs have been administered, there have been only two deaths which could be laid to the drug

*Read before Medical Society of the State of New York, May 22 1928 at Albany N Y

tion being relieved by replenishing the chlorides of the blood with one per cent sodium chlorid, intravenously, and hydrochloric acid by mouth This type of treatment relieved alarming symptoms in one case of arsenical poisoning for us, and we have strong evidence to believe the other two cases that died could have been saved had we known the above facts

(3) The importance of getting a detailed blood analysis very early in cases showing signs of arsenical toxemia

(4) I am not hazarding a guess, at the present time, as to the mechanism of the above findings in such cases

(5) Glucose was given as a diuretic and secondly, in as much as the liver bears the brunt of attack in arsenic damage, because it is known as an aid in the return to normal of liver function

(6) Sodium thiosulphate was given for its supposedly neutralizing effect upon the arsenic

(7) Calcium chlorid was given early to combat the tetany, however, it was not a low calcium tetany, but one due to alkalosis

THE PARANASAL SINUSES IN RELATION TO DISEASE OF THE OPTIC NERVE*

By EMORY HILL, M D., RICHMOND, VA.

THIS communication is not concerned with the grosser manifestations of sinus disease. The extensive ocular disorders in the form of muscle palsies, optic neuritis, exophthalmos, orbital cellulitis and abscess, are well-known and fairly easy to diagnose The possibility that the sinuses are responsible for these conditions is always before us, but there are equally menacing visual disorders, with less conspicuous signs, which may lead to blindness unless the sinuses are suspected and investigated promptly I refer mainly to retrobulbar neuritis and to slight ophthalmoscopic alteration of the nerve head and adjacent retina in which the common causes (diabetes, multiple sclerosis, toxic amblyopias, syphilis, etc) are absent Gross evidence of sinus disease may also be absent, and radical attack upon the sinuses would not be warranted except for the grave danger of blindness Certain cases are also included in which purulent sinusitis acts as a focus of infection through the medium of the blood stream, giving rise to metastatic lesions in the uveal tract mainly, precisely as other more remote foci act

It is not my purpose to discuss the diagnostic signs of sinus disease, nor the methods of treatment which are in the jurisdiction of the rhinologist. I wish merely to call attention to the urgency of the ocular condition, to the diagnosis from the ophthalmologic standpoint, and to mention some very striking results of the treatment carried out by my rhinologic colleagues in the more obscure forms of sinusitis

It is unnecessary in this audience to go into details of the history of the subject or to cite the enormous literature which has accumulated A few references will be quoted We are all familiar with the intimate anatomic relationship of the optic nerve to the posterior sinuses and the many variations in this relationship, with the extreme thinness of the sinus walls and even the direct passage of the optic nerves through the sphenoidal cavity These facts have been emphasized many times by numerous writers My impression is that some rhinologists have gone to extremes in attributing a great many ocular disorders to sinus disease, and that they have confused the signs of intracranial pressure with inflammatory lesions of the optic nerve to the detriment of the patient who has been subjected to unnecessary surgery and has lost time in getting relief from intracranial disease My impression is, also, that some ophthalmologists have erred on the opposite side (myself among them), in denying the responsibility of sinus disease for a small group of optic neuropathies While I have not seen, or not recognized, many such cases, I have been forcibly impressed by a comparatively few in which there can be no reasonable doubt that vision was saved by the prompt clearing up of sinus infection

There is much difference of opinion as to the frequency of the sinus origin of optic neuropathies Francis and Gibson[1] believe that very few cases occur in spite of the paper-thin bone separating the optic nerve from the sphenoid cavity Von Hippel[2] believes the cases are rare, but regards them as extremely important, since proper treatment is necessary to save vision Lindenmeyer[3] points out that cases regarded as proven may eventually be explained by a multiple sclerosis, and cites two such cases Loeb[4] places the frequency as 15%, while Cheval and Coppez,[5] find 35% to 40% Woods and Dunn[6] found 12 7% of optic neuropathies due to sinus disease, and called attention to the acute cases in which the picture is one of retrobulbar neuritis without evidence of inflammation or elevation of the papilla Van der Hoeve,[7] whose investigations deserve the utmost respect, described the characteristic sign of central scotoma with enlarged blind spot The scotoma is at first a relative one for colors The enlargement of the blind spot appears first. One scotoma may appear alone and invade the region of the other The exact pathway of infection is not known He mentions the following possibilities (1) by direct spread of sinus inflammation, (2)

* Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 22 1928

left cornea and evidence of birth paralysis of her left arm. Her temperature was ninety-eight and four-fifths, Fahrenheit, pulse eighty-eight, respiration twenty She also had slight bleeding from the gums, and moderate oedema of the legs, ankles and feet.

Soon after admission she was given a high colonic irrigation and orange and lemon drinks, also 0 2 gram, sodium thiosulphate, intravenously This was followed by a Harris drip of four per cent glucose and two per cent bicarbonate of soda Two hundred and fifty cubic centimeters of twenty per cent glucose were given intravenously She did not void for forty-two hours, when she passed sixteen ounces of urine which was essentially normal as were daily specimens thereafter On admittance her blood showed two million eight hundred and ninety thousand red blood cells with fifty-five per cent hemoglobin, but normal leucocytes

October 21, she received three hundred and fifty cubic centimeters of ten percent glucose, intravenously, 0 3 gram of sodium thiosulphate, intravenously, besides the Harris drip of glucose and bicarbonate of soda A spinal tap showed negative findings except a decided curve in the luetic zone of the colloidal gold test (0155553000) Her vomiting continued and she was decidedly weaker

October 22, blood was taken for chemical analysis and at the same time she received 0 6 gram of sodium thiosulphate and 300 cubic centimeters of 20 per cent glucose, intravenously At eight p m two hundred and fifty cubic centimeters of twenty per cent glucose were again given Her blood pressure was normal, pulse, one hundred and ten, respiration twenty-five and temperature, one hundred degrees Fahrenheit She was drowsy and was put on the danger list Her blood chemistry showed these remarkable findings, serum chlorides, three hundred and eighty-three mg per one hundred cubic centimeters, sugar, one hundred mg per one hundred cubic centimeters, nonprotein nitrogen, one hundred and ninety-eight and four-tenths mg per one hundred cubic centimeters, urea nitrogen, one hundred and nine and one-tenth mg per one hundred cubic centimeters, urea, two hundred and twenty-eight and nine-tenths mg per one hundred cubic centimeters, creatinina, seven and five-tenths mg per one hundred cubic centimeters, uric acid, eight and six-tenths mg per one hundred cubic centimeters, carbon dioxid, eighty-six per cent by volume.

October 23, she received three hundred and thirty cubic centimeters of ten per cent glucose with one gram, calcium chlorid and 0 6 gram, sodium thiosulphate, intravenously, at nine a m and this was repeated at five p m Sodium bicarbonate and citrous drinks were discontinued since the blood chemistry demonstrated we were dealing with an alkalosis One cubic centimeter of dilute hydrochloric acid three times a day was begun Up to this time she had continued to vomit and the tremor was more marked

October 24, a maculo-popular rash appeared over extremities, and the same medication was given as on the previous day Vomiting continued, however, and she showed no change clinically or in her blood chemistry

October 25, she received two hundred and eighty cubic centimeters of ten per cent glucose and one per cent sodium chlorid, and 0 6 gram, sodium thiosulphate, intravenously Her blood chemistry showed serum chlorids, four hundred and sixteen mg per one hundred cubic centimeters, non-protein nitrogen, one hundred and twenty-three mg per one hundred cubic centimeters, urea nitrogen, sixty mg per one hundred cubic centimeters

October 26, she was given one hundred and forty cubic centimeters of ten per cent glucose and one per cent sodium chlorid, intravenously, as well as two hundred and fifty cubic centimeters of blood (transfusion) She showed clinical improvement

October 27, she received three hundred and twenty cubic centimeters of ten per cent glucose and one per cent sodium chlorid, intravenously

October 28, she received for the last time three hundred cubic centimeters of ten per cent glucose and one per cent sodium chlorid, intravenously She began to improve rapidly, she had retained boiled skim milk for three days past, the rash was disappearing, her tetany had disappeared, she was happy and, particularly, her blood chemistry had gradually returned to normal, showing November 7, serum chlorids, six hundred and thirty-four mg per one hundred cubic centimeters, non-protein nitrogen, twenty-six mg per one hundred cubic centimeters, urea nitrogen, seventeen mg per one hundred cubic centimeters, creatinine, one mg per one hundred cubic centimeters, uric acid, three mg per one hundred cubic centimeters, carbon dioxid, 55 3 per cent by volume. She was discharged November 11, apparently completely recovered from the toxemic condition for which she was admitted to the hospital On April 18, 1928, her blood Wassermann was two plus She had no antisyphilitic treatment since her hospitalization until April 21, 1928, since which time she has had weekly injections of bismuth, four in all without any ill effects She had the mentality of a four year old child, and her weight is fifteen pounds above normal

Comment (1) In scanning the literature on antisyphilitic therapy, I have not been able to find a single instance of the syndrome described in the above three cases Various toxic symptoms have been described, even with nitrogen retention, but not alkalosis with signs of tetany

(2) Rowntree and others describe a similar syndrome with low serum chloride, nitrogen retention and a high alkali reserve of the blood in cases of obstruction near the pylorus, the condi-

adjacent retina and decrease in the scotoma, in the course of three months After one year, he has 5/4 vision, the same tail-like extension of the blind spot, and a normal eye ground except for some engorgement of the superior temporal vein, and a faint suggestion of organized exudate on the disc.

Case 4 Mrs L, aged 32, referred by her physician, on Dec 6, 1924, with a history of sudden blurring of right eye one week before Medical study was negative. Rt. vision = 5/40, Lt. vision = 5/6, unimproved by correction of hyperopia. Fundi normal The right field showed an absolute central scotoma She was sent to Dr E T Gatewood for examination of the nose and throat He found diseased tonsils and both antra and ethmoids the seat of purulent infection Operation upon the sinuses was followed by improvement to 5/15 with only a faint relative scotoma and slight enlargement of the blind spot, after six days After three months, vision was 5/6 and no scotoma was present

Case 5 E L G, aged 25, seen Sept. 10, 1923, complaining of a sudden attack of blindness in left eye two days before Rt vision= 20/20, Lt. vision = f at 1 ft In the left there was an absolute central scotoma, surrounded by a relative scotoma, right field normal Nothing found on objective examination of eyes, except sluggish pupil on left Patient referred to Dr E T Gatewood for nose and throat examination When next seen, four days later, there was a marked increase of the absolute scotoma At this time Dr Gatewood reported infected tonsils and left antrum, and double spheno-ethmoiditis Tonsils were removed and sinuses drained Nine days later central vision was much clearer, but there was complete loss of lower field Five days later vision was 20/20 and the fields normal One month after onset his vision was still 20/20 and fields normal

On July 29, 1924, ten months later, the patient returned complaining of a sudden attack of blindness in the right eye Left vision = 20/20, right nil Dr Gatewood again found infection in the ethmoids and antra, which were drained Four days later there was light perception in the temporal field Five days later he was able to distinguish hand movements At this time there was an absolute central scotoma Ten days later he was able to count fingers at six inches, and the fields showed only a relative central scotoma He has not been seen since.

This case showed the characteristic retrobulbar neuritis, the papillomacular bundle being especially vulnerable The tonsils might be considered a factor in the first attack, but the subsequent involvement of the second eye, long after tonsillectomy, points conclusively to the sinuses

Case 6 Mr W, aged 25, referred by Dr J W Jervey of Greenville, S C, March 5, 1928 All tests negative except for history of excessive coffee drinking Unexplained reduction of vision to 5/15 O U with variable refraction, but always slight C H Ast., and no improvement with glasses No scotomas nor enlargement of the blind spots had been found Several infections had been removed (teeth, tonsils), he had had a mild ethmoiditis

As vision was somewhat worse when I saw him and there were central scotomas and enlarged blind spots, I asked Dr E T Gatewood to examine the sinuses again He found a shadow over the left antrum by x-ray, pus in the right sphenoid and shreds of mucus in the left sphenoid After washing out the sphenoids, the central scotomas were exaggerated, becoming more nearly absolute

The patient returned to his home and Dr Jervey writes that he has found active sphenoethmoiditis since, and is treating this Vision has improved to 5/10

This case illustrates the difficulty sometimes encountered in fixing the blame upon the sinuses They were passed as negative by a most competent rhinologist, and began to show disease just when he reached us, and since has shown more frank spheno-ethmoiditis, which seems to be yielding to treatment

This small series suggests the importance of the utmost care in studying the sinuses of individuals who have impairment of vision with or without ophthalmoscopic signs in the eye grounds Inflammatory lesions which are not accounted for by infection located elsewhere in the system, demand this study as part of the search for focal infections Serious impairment of central vision with normal eye grounds, and not explained by errors of refraction, constitutes an even more serious problem The central field changes determine the diagnosis here, and the sinuses must not be ignored when the usual causes of toxic amblyopia are excluded

Several questions arise which cannot yet be answered The size of the optic foramen may be a factor in the vulnerability of the optic nerve in the presence of very slight infection of the posterior sinuses The effect of mere ventilation of the sinuses, in the absence of infection, is unsettled The so-called hyperplastic membrane lining the sinuses, seems to be a cause of optic nerve disturbance Whatever the rhinologist may eventually decide in these matters, we cannot escape the conclusion that certain eyes are saved by early intervention in cases of obscure or slight sinus disease The sequence of events is too prompt and too definite, in too many cases, to be merely coincident

by pressure due to the distention of the sinus walls, as in mucocele, (3) by irritating influences of toxins causing edema and stasis Cutler[8] says that Van der Hoeve's sign is positive when (1) the scotoma for colors is considerably larger than for white, (2) the extent for white and colors is decidedly greater than normal, (3) the size of the scotoma changes in the course of the disease Van der Hoeve offers the following conclusions (1) the ophthalmologist has in the eye no sign to distinguish the origin of a retrobulbar neuritis, (2) the rhinologist cannot say with absolute certainty that a person has no sinus infection, (3) opening of the sinus, even if nothing pathologic is found, may be of temporary or permanent good effect on the optic nerve disease

Janssen[9] sums up the experience of the Kiel clinic with the following questions and answers

1 Is the exploratory rhinologic operation of such harmless nature as to justify its execution in cases with normal rhinoscopic findings?

The purely exploratory nasal operation can be justified, but it must be performed by a skilled operator, with all possible precautions, and requires a subsequent observation at the hospital

2 Is it possible in otherwise doubtful cases to arrive at an exact diagnosis of the pathogenesis and especially of the rhinogenous nature of a neuritis by a nasal operation?

We cannot answer in the affirmative Because of the often highly complicated anatomic conditions in these regions, it should be the rule to have a histologic examination made of all particles of mucous membrane or cell partitions removed during the examination Nevertheless, the possibility must be reckoned with that one or another affection of the accessory sinuses may escape notice

3 Upon whom does the responsibility for operation devolve, the ophthalmologist or the rhinologist?

On the rhinologist The ophthalmologist may decide what symptoms warrant operation With other probable causes (syphilis or tobacco) we should wait upon the treatment of these conditions

Case 1 Mrs W, aged 28, seen Nov 22, 1923, with history of a "spot" in left eye 6 years ago Tonsillectomy had been done Vision became worse two weeks ago Right eye normal in every way, left vision = 2/60 (excentric), vitreous floaters, exudate at macula slightly elevated, about 1 d d in size, consecutive atrophy of nerve head, great engorgement of retinal veins Medical study negative Referred to Dr E T Gatewood, who found purulent infection of left frontal, ethmoid and sphenoid Operation was postponed by the patient and vision became worse. On December 7th, following drainage of the sinuses, vision improved, the macular lesion became flatter, the venous engorgement lessened Local treatment (atropin and dionin) was kept up The right vision became blurred in the next two months, sinus treatment was renewed, the macular lesion became flat A relative scotoma for colors and enlarged blind spot occurred in the right field, with vision reduced to 5/7 This cleared entirely, with 5/5 vision in another 6 weeks, and there has been no recurrence

In this case a macular choroiretinitis developed on the site of the scar of a similar lesion, and a retrobulbar neuritis occurred on the opposite side Both subsided upon the clearing up of a sinus suppuration

Case 2 Mrs M, aged 55, referred by Dr E T Gatewood, Oct 7, 1921, with a diagnosis of purulent infection of sphenoid and ethmoids Eyes pain, vision unsatisfactory, though 5/5 and 5/6 Nasal edge of discs blurred, otherwise normal eye grounds Marked contraction of fields and enlarged blind spot for red in the left Blind spot not included in the remaining field of the right eye Drainage of the sinuses was followed by widening of the fields, revealing enlargement of both blind spots for red

In 1924, an external operation was performed for right frontal sinusitis, and diplopia followed, which was relieved by a prism correcting a right hypertropia

In October, 1925, fields were normal, with no enlargement of the blind spots A prism was still needed to avoid diplopia

This case showed a mild optic neuritis, without special involvement of the papillo-macular bundle

Case 3 H C, aged 17, was seen Sept 14, 1926, for refraction He showed a small spot of old chorioidal atrophy in the upper nasal quadrant, with no impairment of central vision In December, 1926, he saw Dr Louis Greene, while in school near Washington, D C, because of sudden blurring of the left vision and pain behind this eye Dr Greene found an optic neuritis and referred him back to me The left disc was swollen about 2 D, with edema above and to the temporal side, extending along the superior temporal vein, which was extremely dilated Vision was 5/15 and the peripheral field was normal, except for green, which was not recognized The blind spot was much enlarged There were stumps of tonsils, and a few pus cells found in the urine The tonsils were removed Vision sank to 5/22, and the optic neuritis increased, while the scotoma enlarged, and the peripheral field contracted Dr Thomas E Hughes, at my suggestion, explored the sphenoid, although the sinuses were negative to all usual examinations A minute amount of shred-like mucus was found Repeated irrigation of the sphenoid always brought on the pain of which the patient had previously complained, and blurred his vision for a few moments Gradual improvement followed, in spite of one recrudescence, with return to 5/5 vision, subsidence of the swelling of the disc and

content generally to be low This is an interesting observation when one recalls the convulsions following the use of insulin where a hypoglycemia has been induced On the other hand, despite the apparently close relation between tetany and epilepsy, our investigations[4] have not revealed any deficiency in blood calcium—even in two rachitic epileptics included in our series

In a study[5] of the spinal fluid in a series of 50 epileptic individuals, the pressure, measured by a mercury manometer, was usually found at the upper borderline of the normal and was much influenced by external mechanical factors (conditions external to the central nervous system), rising as much as 100%, for example, in some cases of coughing The cell count, albumin, globulin, chloride and urea contents, were all within normal limits The absolute sugar value was low, as in the case of the blood sugar content In every instance except one the content of sugar in the fluid was lower than that in the blood and these two values were independent of each other

In testing 1,000 epileptics, by means of skin tests, for their hypersensibility to 60-70 different protein food stuffs, it was found (6, 7) that protein sensitization occurred in from 37 to 56 8% of the patients tested as compared with an incidence of 8% among non-epileptic controls tested with a number of the same protein extracts This would indicate that quite a number of epileptics are sensitized to one or more proteins The exact significance of the ratio of the percentage of positive reactions in epileptic and non-epileptic individuals remains to be determined but the greater incidence among the former suggests a possible defect of protein metabolism in these cases

Because of the close and persistent association of the two conditions in the lay mind this paper would seem incomplete without a reference to the relationship existing between syphilis and epilepsy The occurrence of syphilis among our patients as determined by the Wassermann (and also by clinical examination) is very low[8] In those cases admitted to the institution during the last eight years, its incidence has fallen under five per cent and this number includes the not infrequent number of cases, where the relationship is coincidental rather than etiological

Autopsy frequently fails to disclose any gross abnormality in the central nervous system When such abnormalities occur, however, the pathological defects most frequently encountered are microcephaly, hemiatrophy, chronic internal hydrocephalus, focal cerebral softening and brain tumors (often ostemata of the dura) But similar pathological conditions are also found in the feebleminded and the insane and are, therefore, not pathognomic of epilepsy

From this brief survey of some of the laboratory findings in epilepsy, it is obvious that in this condition, as perhaps in a number of others, while much has been done, much more still remains to be done before a solution of the problem can be achieved

HEMATURIA COMPLICATING ALKALINE THERAPY FOR HEARTBURN

By IRVING GRAY, M D., F A.C.P, BROOKLYN, N Y

GASTRO-INTESTINAL symptoms due to calculus in the genito-urinary tract is not uncommon and is well known to all The reflex viscero-motor, viscero-visceral, and viscero-sensory disturbance reflected in the gastro-intestinal tract by a disturbance in the genito-urinary apparatus may at times be so pronounced as to mislead one regarding the real source of the patient's complaints x-ray examination of the genito-urinary tract should be made routinely in any individual with gastric symptoms in order to exclude a renal calculus as a causative or contributing factor A great deal of stress and correctly so, is put upon the importance of gastro-intestinal symptoms either motor or secretory due to renal calculus

It appears important to point out at this time, that there can and do occur urinary symptoms that are primarily of gastric origin Hardt and Rivers, in 1913, first called attention to toxic manifestations following the Alkaline treatment of peptic ulcer The symptoms of toxemia were associated with urinary changes, increased blood urea, and normal or increased carbon dioxide combining power of

SOME LABORATORY FINDINGS IN EPILEPSY*

By HAROLD A. PATTERSON, M D, F A C P, SONYEA, N Y
Resident Pathologist, Craig Colony, Sonyea, N Y

AS the title implies this paper will be confined to a consideration of *some* of the laboratory findings in epilepsy and will, therefore, be restricted to the brief discussion of a number of the more salient features of laboratory procedures to which recourse is generally had in connection with this disorder, namely urinary findings, blood picture and biochemistry, spinal fluid changes, protein sensitization and post-mortem observations, prefacing the discussion with the admonition that these findings, while interesting and often significant, are not altogether peculiar to the condition we are describing

The occurrence of albumin and casts in the urine of epileptics after seizures has been well substantiated by the observations of Munson[1] and others The initial appearance of albumin may be at any time within the first two hours after the attack and it may not disappear until the fourth day The presence of albumin is almost invariably associated with the finding of casts, sometimes in great number and variety, although, as might be expected, cellular varieties are rare So extreme is the microscopical picture presented in some of these cases that, had the excretion been received at the laboratory without clinical data, it would naturally have been supposed that the urine was from a case of severe nephritis In fact, as the seizures continue, chronic changes in the kidney due to repeated congestion may be induced This condition of the appearance of albumin and casts in the urine is found in about 20% of epileptics and is known as post-epileptic albuminuria

The literature is somewhat controversial in regard to the blood pictures encountered in epilepsy Generally speaking, the older accounts characterize it as a moderate secondary anemia with constant eosinophilia and lymphocytosis, both of varying degree, and a rise of the leucocytes during the seizure with a subsequent gradual decline In our own observations, we have found the blood picture to be quite variable. Many patients exhibit a moderate to high[2] leucocytosis during the interparoxysmal period as well as during the attack without any discoverable foci of infection On the other hand, a relatively small number show a persistent leucopenia Lymphocytosis is generally present but the ratio between the large and small lymphocytes is disturbed, the former appearing in larger numbers than would normally be anticipated Eosinophilia is usually present in varying degrees A peculiar and interesting finding is the occurrence in considerable numbers of a degenerated form of white cell, which is infrequently found in the normal blood, so far as we have been able to determine Contrary to the apparently prevailing conception, in our observations we do not always find a secondary anemia Although anisocytosis or cell distortion is quite common, polycythemia or hyperchromemia, an increase in the number of cells or the amount of haemoglobin in the individual cell respectively, is often found The blood platelets seem to tend to disintegrate with unusual rapidity and (perhaps for this reason) the bleeding time is prolonged and the coagulation time delayed

In regard to the biochemistry of the blood, Wuth[3] says that the chemical constituents of the blood are altered during convulsions Non-protein nitrogen, uric acid, creatinin and serum protein show an increase of varying degree Often, especially in light attacks, they do not exceed, or at least not so much, the so-called normal limits, but they do exceed what he calls the normal individual limit, i e., the blood content value is higher during attacks than in the interim for a given individual With the higher values sometimes found, it is important to bear in mind that such high values may be produced by the convulsions alone to avoid mistaking such cases for uremia, however, in the latter condition, with nitrogen retention and insufficiency of the kidney, there would probably also exist hypertension in the intervals between convulsions Wuth believes that the high values which may be obtained for non-protein nitrogen, uric acid and creatinine during convulsions are due not only to retention but also to an increased disintegration of body material In this connection, it must be borne in mind, however, that the same blood changes take place in convulsions of totally different origin as, for example, cerebrospinal lues, arteriosclerosis, general paresis and cardio-vascular-renal disease.

In our own studies we found the blood sugar

*Read before the Quarterly Meeting of the Wyoming County Medical Society, at Warsaw, New York, October 25th, 1927

water, there followed gradual improvement in clinical symptoms and a return to normal

The procedure of the test was rigorously adhered to in order to definitely prove that a hematuria can be due to a marked phosphaturia Although in cases of alkalosis, irritation of the kidneys may cause appearance of red blood cells in the urine, in the three cases reported it was felt that the hematuria was caused by the passage of a concentrated alkaline urine through the urethra Beer reports several cases of phosphaturia in which clear normal urine, from the bladder, was voided in the typical milky appearance of a marked phosphaturia This author explains the instantaneous character of the change as a peripheral and a local one rather than due to any particular metabolic disturbance

The absence of cystoscopic examination, the fact that we did not catherterize the kidneys and did not do a pyleography can perhaps be correctly used as an argument for the presence of some other cause for the hematuria in the three cases reported It is felt, however, from the clinical course and the therapeutic results that the phosphaturia associated with some metabolic disturbance was aggravated by the alkaline therapy and caused the hematuria

It is my opinion that the hematuria was urethral in origin and was due to an irritation produced by the passage of a highly concentrated phosphatic urine

IN WHICH TYPES OF GOITER IS IODIN INDICATED?*

By J WILLIAM HINTON, M.D, F.A.C.S., NEW YORK, N Y

IN spite of the work which has been done by Marine, Plummer, Graham, Rienhoff and others, to clarify the indications for iodin administration in thyroid diseases, there still remains a lack of conception of the limitation of iodin therapy by a high percentage of physicians This is particularly noticeable in goiter clinics The classification of goiters, as most generally accepted, is divided into four groups First, Adolescent Goiter This is usually seen in children from eight to fifteen years of age In this type we are dealing with a diminution in the normal physiological response of the gland due to the lack of sufficient iodin in the system Second, Colloid Goiter, which is usually seen in patients from sixteen to twenty-five years of age These represent the same type of goiter and for that reason our remarks in the future will include the adolescent and colloid goiters Third, Adenomatous Goiter This is the nodular type which is generally encountered during the child-bearing period, or at other periods when excessive demand is thrown upon the reproductive system, namely, puberty and the menopause The secretion in this type is, as a rule, normal in the early stages of the disease, but after a period of years, or with repeated pregnancies, we have the adenomatous type of goiter with hyperthyroidism This is really a late manifestation of the original condition Fourth, *Exophthalmic Goiter or Graves' Disease* In this type we have a hypertrophy and hyperplasia of the entire gland The degree of each depends on the severity of the disease, and the duration before seeking medical aid

The Use of Iodin in Adolescent and Colloid Goiter In these types of thyroid disease one is justified in using iodin or thyroid medication as a curative measure One should try to rule out the possibility of an adenomatous or nodular mass It is inadvisable to use iodin in these types, unless the patient is constantly under a physician's care. Hartsock (7) in 1926 called attention to the indiscriminate use or iodin and states "During the last year, we have been impressed by a great increase in the incidence of hyperthyroidism and particularly by the appearance of an unusual type of thyroid hyperactivity in men We have therefore made a special study of these cases with particular reference to the possible etiologic factors involved, and have found that the accumulated evidence seems to point conclusively to the continued ingestion of small amounts of iodin in the insidious form of iodized salt as the primary exciting factor For this reason, we feel that it is important to call the attention of physicians, and through them of the public, to the misunderstanding that has gradually arisen regarding the use of iodin in endemic goiter, particularly in the form of iodized salt Without any precaution being given for its use, this salt is being vigorously promoted by the combined propaganda of health officials and of salt companies, who, through the agency of newspaper articles, civ-

* From the Goiter Clinic of St Mark's Hospital New York.

the blood plasma Further attention was called to the renal changes and the finding of red blood cells in the urine, by Rivers, who advocated the giving of small amounts of alkalies in cases of hyperacidity so as to avoid renal irritative phenomena

My interest in the problems of urology became acute some eighteen months ago, when a burning on urination for a period of forty-eight hours was followed by hematuria Examination of the urine when the burning sensation started showed a marked phosphaturia, alkaline urine with an occasional red blood cell in each microscopic field Repeated x-ray study of the genito-urinary tract failed to show any calculus Therapy was then instituted to reduce the marked amount of phosphates and render the urine less concentrated All fruits and vegetables were excluded from the diet, 10 grains of acid Sodium Phosphates were taken every three hours and two quarts of water were drunk daily Within a period of seventy-two hours the phosphates were markedly decreased, all red blood cells had disappeared from the urine and a normal or slightly acid reaction was present

In two other male adults, seen about one year ago, one aged 38, and the other 26, who were under treatment for duodenal ulcer, symptoms of dysuria were followed by an attack of hematuria Roentgen examination failed to show any calculus in the genito-urinary tract and examination of the fresh urine showed a large amount of calcium, magnesium and other phosphates in association with numerous red blood cells Dietetic and therapeutic therapy were instituted and brought about relief of symptoms and absence of red blood cells within four to seven days after treatment was started The sequence of events that took place in both these patients as well as myself may be summarized as follows because of frequent heartburn, alkalies, particularly Sodium Bicarbonate, were taken several times during the day in doses of one-half to one teaspoonful Very little water was consumed and there was a gradual increase in the turbidity of the urine, burning on urination and hematuria

Phosphaturia, in some individuals may be persistent and produce no symptoms It is known to occur particularly in patients with hyperchlorhydria and in neurotic individuals Two of the patients under my care had high acid gastric content in association with their duodenal ulcer and besides taking the small amounts of alkalies after their meals, because of business conditions would substitute a teaspoonful of bicarbonate of soda for relief of their distress several hours after meals, in place of the glass of milk prescribed Bladder irritability symptoms that arose were out of all proportions to the gastric complaints Baehr studied four patients with marked phosphaturia This author believes the condition to be due to a disturbance of the acid base regulating mechanism caused by the excessive loss of hydrochloric acid after meals, causing a corresponding decrease of the acidity of the urine This post prandial alkaline tide is greatly exaggerated in all cases of phosphaturia Vegetables, especially potatoes and most fruits were found to prolong the alkaline urinary tide

Baehr stated, "During the period of digestion, there is a temporary loss of acid in the stomach and in order to maintain its approximate neutrality the body must therefore compensate by excreting less acid in the urine, (and less CO_2 in the alveolar air) In the case of phosphaturia the persistent hypersecretion of acid in the stomach actually results in compensatory secretion of an alkaline urine The phosphates, which normally occur in the urine as acid salts are excreted under these conditions as alkaline salts in combination with sodium, potassium, calcium and magnesium, all of which, especially the latter two, being of relatively low solubility If the urine has become frankly alkaline phosphates have been precipitated, the subsequently reabsorbed acid is usually inadequate to redissolve them in the bladder"

During the past year, examination of fresh specimens have in many instances revealed a phosphaturia and in four patients the presence of occasional red blood cells could be accounted for by a marked hyperacidity associated with a neurotic state and the taking of moderate amounts of alkalies In none of these patients was there an alkalosis and the presence of the red blood cells could not be associated with any renal changes but were believed to be due to local factors

In order to prove that the hematuria was due to an increase in the amount of phosphates in a concentrated urine the writer underwent the following therapeutic test about three months ago A vegetable and fruit diet formed the only articles of food taken in association with one half teaspoonful of bicarbonate of soda every three hours Very little fluid was taken other than coffee for breakfast and tea for lunch and dinner Within five days a distinct increase in the amount of phosphates in the urine was noticed with an increasing alkalinity Ten days after the therapeutic test was instituted, bladder irritability with burning on urination was accompanied with the presence of numerous red blood cells With the cessation of the prescribed diet, abstinence of alkalies, the taking of acids by mouth and large amounts of

and in the toxic adenoma, the only difference noted being one of degree In the hyperplastic cases, the average fall of basal metabolism during the preoperative interval has been 50 per cent, while in the toxic adenoma it has been 40 per cent, as shown in the accompanying chart This slight variation may be explained by the more complete nervous relaxation of the exophthalmic patient It is realized that this response to iodin in the toxic adenoma is at variance with that reported by many observers in the Middle West The only explanation we can offer is that there may be some difference in the pathological physiology of the toxic adenoma in various regions Certain it is that the effect observed in this clinic has been of the same nature in the two types of hyperthyroidism"

Elliott (2) in 1927 in reporting one hundred cases of hyperthyroidism by thyroidectomy states "Iodin was used in 69 cases as a pre-operative measure and no essential difference was noted in the response of the exophthalmic and the adenomatous types Twelve cases, clinically of the adenomatous type, with the diagnosis confirmed by histologic sections, showed a drop in basal metabolism rate In ten it dropped more than 25 per cent, in six of these there was a decrease of more than 50 per cent.'

Rienhoff's (12) work appearing about the same time has given a definite reason for the iodin administration From his work one has to question the number of actual adenomata which are seen and wonder if a high percentage of the so-called cases of adenomatous goiter are not the hyperinvolutional changes which he has described in such detail He states "In the true sense of the word these areas were not adenomatous for the reason that the structure of the gland was maintained throughout, the general stimulus of hypertrophy and hyperplasia in the gland, as a whole, has been followed in these localized areas or lobules and there is no evidence of new tissue formation However these areas were interesting because they may well serve to explain the temporary beneficial effect or remission following the use of iodin and also why the patient, clinically, cannot be brought to the status of a normal individual by the use of iodin always being in a state of low grade hyperthyroidism It is also not felt that the areas of hyperinvolution or persistent colloid bodies are in any sense adenomatous and for the same reasons which are mentioned above, namely, because they maintain the normal histologic structure of the gland, there is no evidence of new tissue formation and the general stimulus to hypertrophy and hyperplasia of the gland, as a whole, is obeyed in these areas From the evidence at present, it would seem that most of these tumors palpable in the nodular goiters are nothing more than involutional bodies of the same type as have been described above, and with a great many, in fact nearly all of the cases of nodular goiter with or without hyperthyroidism which have been described as colloid adenomas, mixed fetal and colloid adenomas, colloid cysts, cystic adenomas and military adenomas are in no sense of the word adenomtaous but the result of an attempt on the part of the thyroid gland, following a hypertrophy, to reapproximate its normal histologic structure, namely, involutional bodies or areas of hyperinvolution and hypo-involution It is not to be gathered from this article that all nodular goiters are involutional bodies because this is undoubtedly not the case, there are, without question true parenchymatous adenomas that have been improperly described as fetal adenomas and there also are localized areas of persistent hypertrophy and hyperplasia which have been described as miliary and diffuse adenomas Whether or not these should be called adenomas is not certain"

From the evidence at present one is lead to believe that iodin has a definihe field of usefulness as a pre-operative medication in the adenomatous type of goiter with hyperthyroidism Although I did not at first hold this view, I have changed to Graham's teachings

The Use of Iodin in Exophthalmic Goiter or Graves' Disease "Marine and Williams (10) published in 1908 the results of a study of seventeen patients with exophthalmic goiter who had been treated with iodin, pre-operatively, and came to the conclusion that there was an increase in the colloid following iodinization It is generally accepted that iodin should be used as a pre-operative medication for exophthalmic goiter The improvement which it brings about is most striking and some members of the profession have openly declared it has a curative effect in this type of goiter Plummer applied this principle in 1922 in the pre-operative treatment of exophthalmic goiter and this has been generally accepted as the routine preparation of the exophthalmic type

Guthrie (6) states that it was but a few years ago that the administration of iodin to an acutely sick exophthalmic goiter patient was strongly warned against because it was thought that the disease was due to an excess of the normal product of the thyroid in the body, and it was known that this product contained iodin The use of iodin as a skin disinfectant and of iodized catgut was given up in many clinics

Graham and Cutlet (5) in 1926 state "Patients that have had iodin before coming to the surgeon show great variations in the deg-

ic meetings and attractive advertising, have gradually created the impression in the lay mind that iodin is a panacea for all goiter conditions and will ultimately solve the whole endemic goiter problem" From this report one sees the dangers encountered in the general administration of iodin This does not mean to imply that adolescent and colloid goiters cannot be benefited when proprly treated, but one should use every means to rule out the adenomatous goiter before instituting treatment in these types

Indications for Iodin in Adenomatous Goiter In the past several years we have been lead to believe, through the work at the Mayo Clinic, that the adenomatous goiter constituted a separate and distinct clinical entity Boothby (1) in quoting Plummer points out the difference in the clinical syndromes of the adenomatous goiter "Plummer expects to report in detail the theoretic considerations which led to his investigation of the effect of iodin in cases of exophthalmic goiter, I shall not, therefore, discuss this phase of the subject further than to point out that his explanation of the difference in the clinical syndromes of adenomatous goiter with hyperthyroidism and exophthalmic goiter rests on the conception that in the former the constitutional symptoms are due to an excess of normal thyroid secretion in the tissues and cells of the body, whereas in the latter, as a result of an intense and as yet unknown stimulation on the thyroid gland, the quantity of thyroid secretion in the cells of the body not only is increased, but that a certain amount of it is imperfect" But the recent work of Rienhoff and Graham has forced the most skeptical to reconsider this condition, and their work alters one's view on the use of iodin in adenomatous goiter

Adenomas with Normal Secretion It is generally recognized that iodin or thyroid extract is never indicated in this type of goiter Jackson (8) in 1927 stated that "Iodin is certainly very definitely contraindicated after the age of twenty-one years, in the presence of an adenomatous goiter Yet, there are now thousands of persons with this form of goiter who are taking iodin either by means of some patent medicine, or alas, under a physician's direction The newspapers and magazines are so full of articles on iodin and goiter that the laity has come to consider one a cure for the other Every patient who has a goiter comes to the physician with hopes of a cure by iodin In many cases the physician fails to distinguish between a colloid and an adenomatous goiter, or even between an adenamatous and an exophthalmic goiter If a slight reduction in the size of the neck through the effect of iodin on the colloid occurs, there is such gratification that the symptoms of developing hyperthyroidism are overlooked" The general concensus of opinion agrees with Jackson's statement, as applied to the adenomatous goiter without hyperthyroidism

Kimball (9) in 1925 stated "Our experience, however, in the service with which I am connected, leads us to believe that there must be considerable misinformation or misunderstanding regarding the proper use of iodin in the treatment of goiter, and that a brief statement of our experience with patients in whom hyperthyroidism has resulted from the use of iodin in cases of goiters of long standing may serve as a warning to those who first see these patients—In the series of 2,659 cases of hyperthyroidism treated by us during the four and one half years between March 5, 1921, and September 1, 1925, there were 306 —263 women and 43 men,—in which it appeared that the symptoms of hyperthyroidism had been precipitated or made worse by the use of iodin"

Adenomatous Goiter with Hyperthyroidism It was generally thought that this was a separate and distinct clinical entity The work of Plummer (1) at the Mayo Clinic leads one to believe that iodin should never be given in this type of goiter, as a pre-operative measure, as we are dealing with an excess of the normal thyroid secretion, but the work of Graham (4) has shown that the adenomatous goiter with hyperthyroidism can be temporaily improved by the administration of iodin He states "It is a matter of considerable importance to recognize that the quantity of iodin necessary to bring about the same or comparable clinical responst and decrease of basal metabolic rate is much less in cases of toxic adenoma than in cases of exophthalmic goiter This we attribute to the difference in degree of hypertrophy and hyperplasia of the thyroid in the two conditions We emphasize this fact in order that any one who might be interested in this subject may avoid the mistake of administering large quantities of iodin for long periods of time to patients with thyrotoxicosis and slight degrees of hypertrophy and hyperplasia of the thyroid Favorable response and unfavorable response are of the same character whether the thyroid is adenomatous or nonadenomatous The present indications are that the thyroid can utilize iodin to the point of saturation without harmful effects to the patient But beyond this point clinical experience shows that iodin may be harmful rather than beneficial, whatever may be the variety of toxic goiter treated" Later reports have borne out Graham's work, and Frasier and Mossner (3) in 1928 reported "As a preoperative adjunct, iodin is a most useful agent both in the hyperplastic toxic

POLIOMYELITIS IN SYRACUSE*

By A. CLEMENT SILVERMAN, M S, M D., SYRACUSE, N Y.

From the Syracuse Department of Health, and from the Department of Pediatrics, College of Medicine, Syracuse University

IN the past six years, Syracuse has experienced three outbreaks of poliomyelitis, one every other summer In view of the marked interest in this disease and the many unsolved problems in connection with it, it would seem worth while to present a brief report of our clinical and epidemiological observations

Incidence

In the 1916 epidemic of poliomyelitis in Eastern United States, Syracuse, with a population of 160,000, reported 229 cases and 64 deaths From then until 1921, only seven cases and two deaths were reported Table I shows the incidence of cases in Syracuse, both local and imported, from 1921 to 1927 The 1924 outbreak was, next to 1916, the largest that Syracuse has experienced

Relation to Upstate Incidence A spot map of poliomyelitis for New York State in 1916 shows the bulk of cases in the southeastern part of the state with another main focus upstate, centered in Onondaga and Oswego counties West of these counties, but few cases occurred The 1920 spot map for the state is practically clean In 1921, however, the largest focus occurred in Oneida and Herkimer counties with smaller foci in Onondaga, Oswego, Monroe and Erie counties The following year the larger foci upstate were in Onondaga, Oneida and Cayuga counties In 1923 Onondaga and Erie counties showed small foci outside the southeastern part of the state In 1924 on the other hand, the largest focus was in Onondaga County In fact, Onondaga and the four counties bordering it comprised 50 per cent of the total infantile paralysis incidence in the state. In 1925 Monroe and Erie counties showed the larger foci and Onondaga was comparatively clear, but in 1926 the largest focus was in Erie County and the next largest in Onondaga The Syracuse incidence comprised 11 per cent of the total state incidence both in 1922 and 1926 and 16 per cent in 1924

Age and Sex Distribution Table II shows the age and sex incidence It is seen that the age period up to 10 makes up 78 per cent of the total incidence in 1922, 76 per cent in 1924 and 62 per cent in 1926 In other words, in the third outbreak there was a tendency for older children to contract the disease

The ratio of males to females in 1924 was practically 2 to 1, where as it was 1 17 1 in 1922 and 1 75 1 in 1926 The youngest in these outbreaks were respectively 8 months, two months and 15 months, and the oldest 45, 43 and 43 years respectively

Only one colored child was affected in the three outbreaks The apparent immunity of the colored race was also noticed in recent outbreaks in Detroit and Fort Worth, Texas

The three outbreaks occurred in the usual season The earliest date for a report was on May 27 in 1924, and the latest onset was on November 27 in 1922

TABLE I

Poliomyelitis Cases Reported, Deaths and Fatality Rate per 100 Cases· Syracuse Health Department, 1921-1927

Year	Cases of Poliomyelitis			Deaths from Poliomyelitis			Fatality Rate per 100 Cases
	Total	Local	Imported	Total	Local	Imported	
1921	16	16		2	2		12 5
1922	50	49	1	11	10	1	22 0
1923	8	5	3	1	1		12 5
1924	152	137	15	12	10	2	7 9
1925	5	4	1	2	2		40 0
1926	66	63	3	18	11	2	19 7
1927	2	2					

Clinical Types

From the diagnostic and epidemiological standpoints it appears appropriate to divide the cases into three main types bulbo-spinal, spinal, and non-paralytic The latter are supposed to bear an important relation to the mode of spread, the bulbo-spinal practically account for all the deaths It is interesting to note that in 1922 the spinal cases comprise 62 per cent, in 1924, 59 per cent, and in 1926, 40 per cent

The bulbo-spinal group which is usually responsible for all the deaths comprised 32 per cent in 1922, 12 per cent in 1924 and 37 per

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y May 22 1928. A condensation of the original paper which will appear in full elsewhere.

ree of response to pre-operative iodin, and equally great variations in the quantity of iodin necessary to bring about a condition in which operation is safe Under such circumstances the surgeon may be deprived of practically all the immediate advantages of preoperative iodin and is confronted with the alternatives of performing a hazardous thyroidectomy, or resorting to procedures of lesser magnitude such as ligations or hemithyroidectomy, or of waiting for a period before re-instituting complete iodin therapy Fortunately such cases constitute only a small percentage of the total and are practically limited to those that have been taking iodin in large quantities or for a prolonged period of time immediately before admission to the surgical clinic"

Pemberton (II) in 1928 stated that "The administration of iodin (Lugol's solution) to patients with exophthalmic goiter under preparation for surgery, introduced by Plummer in 1922, has resulted in a tremendous step in the progress of surgery in this field The importance of this cannot be overemphasized, I believe history will record as the three greatest influences in the development of surgery of exophthalmic goiter, the discovery of aseptic surgery, the discovery of anesthesia, and the use of iodin in the pre-operative preparation of the patient. Often patients with mild symptoms and those with moderate or relatively high hyperthyroidism with a hard 'trained' goiter, usually of long duration, appear to improve only slightly after the administration of iodin Boothby reported that after the initial improvement due to iodin the patent's condition becomes stable and no further improvement occurs I have since been able to confirm this by the observation of many patients who took iodin continuously for a year or more, and I believe, therefore, that there is no rational basis for administering to patients with exophthalmic goiter with the expectation of curing the disease"

From the reports of the different clinics one must see that iodin as a curative measure in this type of goiter has no field of usefulness

Conclusions I Iodin or thyroid extract should be used as a cure for adolescent and colloid goiters 2 In the adenomatous type without hyperthyroidism, iodin is never indicated 3 In the adenomatous type with hyperthyroidism, iodin is indicated as a preoperative measure 4 Iodin is indicated as a pre-operative measure in exophthalmic goiter or Graves' disease but should never be used except when preparing the patient for surgery, or in combating the crisis of the disease

The important diagnostic clinical signs were found to be neck rigidity and resistance to anterior flexion of the spine Alteration of the reflexes, tremor, sweating, muscle tenderness and the peculiar, anxious, apprehensive, hunted look were the essential symptoms Cell counts as low as 25 were found in subsequently paralyzed cases One case with suggestive symptoms showed a negative spinal fluid shortly after the onset and later developed a one-sided facial paralysis, but a second lumbar puncture was not done

In the differential diagnosis, tuberculosus meningitis was encountered, rheumatic fever, hysterical paralysis, pseudo-paralysis of rickets and diphtheritic palsy

Treatment

In the 1922 outbreak some of the paralyzed cases were treated with immune serum and some with Rosenow's antistreptococcic serum It was soon obvious that with the great tendency of paralyzed muscles to improve, very little could be judged about the effect of treatment. Accordingly in the two following outbreaks, treatment with immune serum was given only to the early cases before any evidence of muscle weakness could be elicited

Table IV shows the number of pre-paralytic cases and the results It is seen that in a group of 32 patients in 1924, given convalescent serum intraspinally in the pre-paralytic stage, 27, or 84 per cent, escaped paralysis Under similar circumstances in 1926, only 13 out of 27, or 48 per cent escaped paralysis Unfortunately, there is no control series of cases similarly observed shortly after onset of symptoms with positive spinal fluid findings but without serum treatment In the 1924 outbreak, however, there were 14 cases diagnosed early in which treatment was carried out with normal horse serum intraspinally, of these, paralysis failed to develop in nine, or 64 per cent

While these results are not scientifically convincing, and the claim has been put forward that lumbar puncture alone may have a beneficial effect, it should be noted that only 12 per cent of the 1924 cases belonged to the bulbar group, whereas 37 per cent of the cases in the 1926 outbreak belonged to this type, and that the fatality rate, likewise, was roughly almost three times as great in 1926 as in 1924 When it is considered furthermore, that the bulk of the non-paralyzed cases occurred among the treated cases, and that very few cases were missed in these outbreaks it would seem justifiable to infer that some good was accomplished by the serum From the experimental side, there is convincing evidence that immune bodies are present in the blood of recovered cases In the present state of our knowledge, it would, therefore, seem that immune serum treatment is the logical one to use

TABLE IV

Syracuse Preparalytic Cases of Poliomyelitis Treated With Serum, and Results

Year	Kind of Serum	Cases of Poliomyelitis				
		Treated	Paralyzed	Showing Muscle Weakness	Not Paralyzed	
					Number	Per Cent of Total Given Serum
1922	Human Immune Horse Serum	3			3	[1]
1924	Human Immune	32	2[2]	3	27	84 4
	Horse Serum	14	5		9	64 3
	Human and Horse	2			2	[1]
1926	Human Immune	27	11[3]	3	13	48 1
	Horse Serum	1			1	[1]

[1] Cases too few for percentage computation
[2] One of these died from respiratory paralysis
[3] Five of these died from respiratory paralysis

Epidemiology

A study of possible sources of infection and observation of the geographical distribution of cases on spot maps appears strongly suggestive of contact infection In the 1924 outbreak, with the greatest incidence of mild cases there are a number of such instances Thus, there are several records of children in contact with positive cases coming down with the disease after an incubation period of eight to 13 days Of ten sets of two cases in a family, three look like secondary cases with an incubation period of 10 to 17 days, the other seven sets came down within one to four days of each other, and were more probably common source infections The spot maps appear to indicate grouping of cases in localities

cent in 1926 In other words the number of deaths appears to be in proportion to the number of bulbo-spinal cases

It is also significant that the non-paralytic group makes up but 6 per cent in 1922, 29 per cent in 1924, and 23 per cent in 1926 The actual number of abortive cases in an epidemic

the Health Department, physicians were made familiar with the development of the symptoms and the diagnostic criteria Consultation and convalescent serum were made available by the Health Department

Whenever a suspect was reported in the pre-paralytic stage, one or two diagnosticians

TABLE II

Poliomyelitis Cases Reported, By Age and Sex Syracuse Health Department, 1922, 1924 and 1926

AGE	Cases Reported 1922			Cases Reported 1924			Cases Reported 1926		
	Total	Male	Female	Total	Male	Female	Total	Male	Female

40 to 44 years				1	1		1	1	
45 to 49 years	1	1							

cannot be so easily determined Other things being equal, the milder and larger the outbreak the greater the relative number of non-paralytic and abortive cases From these figures, however, there appears no justification for the statement that the number of non-

saw the case promptly and when the clinical symptoms warranted, a lumbar puncture was done and the spinal fluid examined at the bedside for cell count and globulin If these were positive, poliomyelitis convalescent serum was injected intraspinally, when necessary the in-

TABLE III

Syracuse Poliomyelitis Cases and Deaths by Clinical Types

Clinical Types	1922		1924		1926	
	Cases	Deaths	Cases	Deaths	Cases	Deaths
All Types	50	11	152[1]	12	66	13
Spinal	31	11	87[2]	1[3]	26	13
Bulbospinal	16		21	11	24[4]	
Non-paralytic[5]	3		38[6]		15[7]	
Unclassified			6		1	

[1] With the added cases in [2] and [6] total cases for 1924 number 161

[2] Two cases with transient muscle weakness were not recorded during the epidemic and are not included in this figure. With these two added, spinal cases number 89

[3] Child died from broncho pneumonia three weeks after the onset of poliomyelitis

[4] One fatal case in this group was strongly suggestive of the cerebral or encephalic type.

[5] Includes treated as well as untreated cases.

[6] All these had been treated with serum Seven abortive cases were not reported during the epidemic. With these seven added, non-paralytic cases number 45

[7] One case had a lumbar puncture but no serum, remainder had serum intraspinally

paralytic cases in an epidemic is about five times the number of paralytic cases

Diagnosis

By means of newspaper publicity, the public was urged to watch for early symptoms of the disease By means of the weekly bulletin of

jection was repeated in 12 to 24 hours Subsequent examinations were made for evidence of muscle weakness or paralysis

Whereas only six per cent of the cases were reported in the pre-paralytic stage in 1922, 36 per cent more reported in the early stage in 1924, and 46 per cent in 1926

feel quite sure that the symptoms will not subside unless the operation is performed We have all seen cases which, when operated upon, were in a very bad way as regards the mastoid process, notwithstanding that nearly all the orthodox symptoms were conspicuous by *their absence* In several of our reported cases it will be noticed that the only symptom present in any marked degree was the absence of light transmission on transillumination of the affected side Our opinion is that the information obtained from transillumination in suspected mastoid infection is of much more value than that obtained from the radiograph, for the reason that in quite a number of cases where a double mastoiditis was present and the findings of the radiograph and transillumination did not agree as to the worst side subsequent operation showed the transillumination indications to be correct. In transillumination the markedly pneumatic mastoid shows more light than the one with less cells unless there is moisture present, in which case it looks darker The radiologist will say he can tell without fail the difference between the shadow caused by moisture in the cells and air without moisture, and will point out how close the lateral sinus is to the canal, but the distinctions shown often look very hazy to one who operates There is one advantage, however, which the radiograph has over transillumination that is of great importance, which is that the radiograph makes a *permanent record* of what it does show; while in the other case we have only the judgment of the observer which cannot be verified except when the patient is present This, of course, is an item of considerable importance

About twenty-five years ago when "McBurney" came back from Europe and told us that every case of appendicitis should be operated upon as soon as a diagnosis was made we all thought that he was advocating a very radical procedure in the practice of surgery Today we all agree that if one is sure of his diagnosis in appendicitis it is near criminal not to advise operation at once The *laity* quite generally recognize appendicitis as a surgical rather than a medical disease, thus showing how far we differ from our former most firmly held opinions Formerly we told our patients when they suffered from an attack of appendicitis that the proper procedure was to treat them expectantly until the attack subsided or the case became desperate, in which case it might become necessary to operate as a sort of last resort to save his life We all remember how often the last resort operation failed to save the patient's life, and what a high death rate we had in those days as compared with that of the present time

From our observation it would seem that the majority of otologists are taking the same position in regard to surgical interference in mastoiditis as we took twenty or more years ago in regard to appendicitis, advising against operative interference as long as there is hope that the symptoms will subside It also seems to us that there is even more reason for us to change our point of view than there was at the earlier period for many of the cases of appendicitis *subsided* under the expectant treatment whether they entirely recovered or not. The same is true of mild cases of mastoiditis, only the consequence of a return of the trouble in the latter is likely to be even more serious than in the fromer There are the brain complications which are always a possibility in a case if neglected Many obscure cases of illness that we see are undoubtedly suffering from some focal infection They have had their teeth and tonsils removed, their sinuses overhauled more or less thoroughly and still are no better Investigating the ears we find in many cases there is an involvement of a mastoid dating back to an attack of O M A P, which occurred in childhood In a great number of cases there has been a mastoiditis without any marked ear symptoms, probably due to the free drainage through a large eustachian tube We see no reason why this condition could not as well be the source of a chronic foci of infection as some of the ones we have been so prone to look upon as the more probable causes of these remote and vague symptoms

In the past, there were two very great deterrents against recommending a mastoidectomy except in the most grave cases First, mastoidectomy, an operation requiring some considerable amount of skill, has great possibilities in the way of disfigurement, as an end result both in the unsightly scar behind the ear and possible facial paralysis, due to injury of the seventh nerve because of its close proximity to field of operation Secondly, there was a long period of convalescence to which the patient was obliged to submit

In regards to the second part of the first deterrent and also the second one as a whole, we have a modification or addition to the Schwartz operation to suggest, which we think largely removes them both, but, of course, one cannot get rid of the dangers of injury to the facial nerve in any mastoid operation which we may devise Eternal vigilance is one's only salvation in dealing with this difficulty

The modification or addition which we recommend is to take down the posterior wall of the ear canal, after having done a very thorough orthodox operation, just as though we were going to do a radical operation except that we leave the so-called bridge intact Thus we let the ear fall back into the hole made and

very much as in other contact diseases Very frequently, though no direct contact can be elicited, indirect contact seems very likely It will be admitted, however, that at best this is but circumstantial evidence

The Epidemiological Problem in Poliomyelitis

The theory of the spread of poliomyelitis by direct and indirect contact appears attractive until one considers the apparent relative insusceptibility encountered There is the inconsistency between the high incidence in the early age groups, as in measles with its extremely high susceptibility, and the low attack rate as shown in the rarity of secondary cases and the general difficulty of tracing contact It is, therefore, postulated that during an outbreak there are a great many abortive cases which provide an opportunity for subclinical immunization

The presence of many more abortive cases than actual paralytic cases is, however, without clinical proof When in an outbreak nearly half the cases are reported in the preparalytic stage in the first 12 to 24 hours and not later than 48 hours, and the public is alert to the disease, one is not likely to miss several times the number of cases proved The possibility that cases have not reached the neurological phase and, therefore, cannot be diagnosed does not square, either, with the field experience in the presence of an outbreak How then explain the apparently low susceptibility?

Recent studies in tropical countries have shown a very high immunity to scarlet fever and diphtheria despite the fact of very low incidence

There is, however, another phase in reference to poliomyelitis that needs to be brought out It is generally assumed that poliomyelitis begins as a systemic disease that may or may not invade the central nervous system, and this view presumes to explain unrecognizable abortive cases This view, however, is not yet established It has not been proved that the visceral lesions outside the nervous system are caused directly by the virus The pathological changes are nowhere so striking as in the central nervous system Experimentally it is almost impossible to infect monkeys by the intravenous injection of the virus, and the virus has not been found in the blood of human cases It is indeed more likely that the poliomyelitis virus enters the central nervous system by way of the nasopharynx Normally the nasal secretions, in the absence of upper respiratory infection, contain some neutralizing substance This forms the first line of defense The intact nasal mucosa acts as a second line of defense The third line of defense is the intact meningeal choroidal system Once the virus gets by these mechanisms of defense the neurological symptoms ensue The determining factor in susceptibility to poliomyelitis may therefore be the differential between the amount and virulence of the virus entering the body on the one hand and the resistantive condition of the various defense mechanisms on the other This differential may offer an explanation of the epidemiological problem in poliomyelitis

---

SUGGESTED CHANGES IN THE ACCEPTED VIEW OF MASTOIDITIS AND ITS TREATMENT SURGICALLY

Results of Observation on a Series of Cases

By W J CRANSTON, M D, AND F H VOSS, M D, KINGSTON, N Y

In approaching this subject, it seems necessary to briefly review the generally accepted view of the subject under discussion The present accepted indications for the performance of a mastoidectomy seem to be the following, if operation is to be performed early (There are variations caused by the surgeon's point of view)

(1) A history of an acute otitis media,

(2) A discharging ear which has continued for some days or weeks,

(3) A bacterial infection of a virulent type,

(4) Bulging of the posterior wall of the canal, with redness,

(5) Severe pain back of the ear with three points of tenderness,

(6) For the ultra-conservative, redness over the mastoid process,

(7) An increase in temperature of at least 2-4 degrees F, for several days,

(8) A high blood count,

(9) A very sick patient likely to die,

(10) An X-ray picture which shows a marked difference on the two sides,

(11) And lastly, for those who use it, a considerably less light showing through on the affected side on transillumination

The last, in our opinion, is by far the most important in determining necessity for operation

There seems to be a large number of very good men who hesitate to operate until they

DIABETIC COMA

A Review of a Method of Treatment

By JOHN RUSSELL TWISS, A B, M D., NEW YORK, N Y

TREATMENT of diabetic coma with small doses of Insulin, frequently repeated, has been in use at the New York Post Graduate Medical School and Hospital for a period of years This method, utilized by the Department of Medicine, has been so satisfactory that a review of the procedure seems merited Three cases have been selected for purposes of illustration, with ages of the patients ranging from eight to sixty-six years

An analysis of the condition of diabetic coma shows that there are three factors in the situation and each must receive separate consideration and treatment The first of these is acidosis, which is controlled by the digestion of sugar and the consequent elimination of the ketone bodies For this purpose Insulin and later glucose are used Desiccation, the second factor of importance because of its frequently being neglected, demands the maintenance of body fluids Fluids are therefore forced by all possible routes, fluid retention is aided by the use of salt and bicarbonate of soda, diuresis is controlled by the elimination of glycosuria The third factor is poor heart action, the weak and rapid pulse, pulmonary stasis and the consequent frequent occurrence of pneumonia Digitalis is here the drug of choice

Acidosis is treated by the use of Insulin in maximum doses of 20 units Upon admission of the patient in coma, urine and chemical blood examinations are done on the basis of urinary findings, treatment is begun at once In most cases 20 units of Insulin are given subcutaneously, accompanied by 20 units given intravenously for immediate effect In this way a supplementary action is obtained, the intravenous medication being largely consumed before the subcutaneous injection exerts its maximum effect For the control of following Insulin injection dosages urine examinations are made at intervals of one to two hours, depending on the severity of the case

Subsequent subcutaneous doses of Insulin are usually of 20 units, given after the urine examinations, until the urine is nearly sugar-free and the ketonuria under control The interval is then gradually lengthened, as indicated by the urinary findings, the blood sugar and CO_2 combining power determinations, and the improvement in the condition of the patient All urine voided by the patient is saved, after a few days a single 24-hour specimen is examined in the mornings Chemical blood examinations are made at least once in 24 hours on admission, later this period is lengthened

Glucose is used with the Insulin to aid in the digestion of the ketone bodies and for the prevention of Insulin shock Acidosis is therefore considered an indication for the use of glucose in the presence of a low or absent urine sugar One unit of Insulin will utilize 1½ to 2 grams of glucose With a marked glycosuria Insulin is used with little or no glucose with a small degree of glycosuria and a large excretion of ketone bodies, relatively more glucose is used with the Insulin Best results are obtained by maintaining a trace of sugar in the urine, without the presence of ketone bodies

With cases where there is no vomiting, glucose can be given in solution or as orange juice, by stomach tube or nasal gavage When the patient is vomiting glucose can be given by rectum, infusion, or hypodermoclysis Saline can also be given by the latter routes, for this purpose we use a 5 or 10 percent solution of glucose in saline When glucose is not indicated, saline may be used alone Bicarbonate of soda is usually given by mouth or by rectum, occasionally an infusion is used Digitalis is given in hypodermic form at first, later it can be taken by mouth Other stimulants are used if necessary, with the application of external heat

This method of treatment has proved satisfactory in a large number of cases Insulin dosage is always under control, the danger of Insulin shock is at a minimum The condition of the patient almost invariably shows a prompt improvement, the acute symptoms are quickly relieved and the tissues assume a normal tone and color Chemical blood findings indicate a progressive improvement in the condition of acidosis, a CO_2 combining power of over 40 usually resulting within a period of 24 hours

Case No 1

P O, female, age 6 years admitted April 29, 1926 A known diabetic for 3 years, the patient had been on a diabetic diet with 15 units of Insulin twice a day, before breakfast and supper Several previous admissions, one in coma, followed dietary indiscretions and the probable omission of Insulin At this time coma had gradually developed following a severe cold of a week's duration, when we suspected the Insulin had not been given

Physical examination showed a fairly well-developed and well-nourished girl of 6 years, comatose, cyanosed, a hot dry skin, deep sigh-

close the wound the whole length with metal clips, except at the lower angle where a small guttapercha drain is placed extending up into the antrum The metal clips and the drain are removed on the fourth day The dressings are changed daily up to this time, and daily thereafter until healing is complete, always being careful to get even pressure over the wound and ear The method of dressing is of great importance in obtaining a good scar and a short healing time

If this method is used, we do not think it is sufficient to remove the cells only in the tip but the *whole posterior part of tip* should be removed The cells at the root of the zigoma should be removed and the antrum when granulations are present must be thoroughly cleaned out with a dull ring curet, which is the instrument of choice with us In fact, a very thorough mastoidectomy should be done, including the removal of the posterior wall of the ear canal down about one-half of the way before the wound is closed If this is done we think the scar back of the ear will be negligible, and the period of healing will be reduced to an average of about ten days, which was the average healing time of twenty-eight cases by above described method as they occurred in our practice during fifteen months at the Benedictine Hospital, Kingston, New York, and are cited to substantiate our claim The average healing time of a second group of 119 cases was less than seven days, operated by the same method, and two of these were neglected cases taking twenty-one days each to heal Hospital morbidity was ten days in this latter series

In the separate series of twenty-eight cases, there were two patients who had double mastidectomies, making a total of thirty operations In this series there were also many complications and obstacles to be overcome before operation could be performed Four cases showed marked chronic nephritis with endocarditis and hypertension There were two cases of diabetes mellitus, with blood sugar over 240 mg 100 cc of blood, and one case of pulmonary tuberculosis The ages of the cases ranged from minimum of two infants, six and eight months respectively, and the maximum of seventy-seven years Seventeen were females and eleven were males

Summarizing as to the negative findings for the usually looked for signs and symptoms we found

(1) Three cases had no tenderness over the tip of mastoid,

(2) Sixteen cases showed no signs of canal bulging,

(3) Twelve cases showed very slight detectible drum pathology

(4) Temperature averaged from 97°F to 105½° F,

(5) Only fourteen cases had a total W B C of over 9,000 (Minimum count was 4,600 and the maximum 24,300),

(6) *Absence of transillumination in all cases and confirmed by operative findings*

The anesthetics used were Straight ether 16, Nitrous oxide and oxygen 10, N_2O oxygen and ether 1, Vienna mixture 1 The minimum days drainage was four and the maximum thirteen The average number of days in hospital was a minimum of four days (infant) and the adult average fifteen days The complicated cases averaged thirty days

Summarizing from the combined averages of one hundred forty-nine mastoidectomies with a mortality rate of none, we conclude that the old-time theory of mastoid operations and its complications can be dispelled, for in this group we have encountered most of the ordinary obstacles and feel justified in making the statement that mastoidectomy should be performed in all cases of a sick patient without other discernible cause, giving a past history of an old chronic otitis media, together with positive findings of lack of transillumination, in spite of the lack of all other clinical and laboratory data usually supposed to indicate the need of surgical interference

We see no reason why every case in which the diagnosis of mastoiditis has been made should not be operated whether we think there is likely to be a fatal termination or not We are strongly inclined to the opinion that it is very doubtful if many cases of mastoditis really entirely recover without operation It is true they may live for years with no symptoms and die of an entirely different disease, but there is still a question if the focus of infection did not persist and may have been the underlying cause of their terminal disease

These statements seem very broad, but our records prove that in cases of all negative findings, even including low leukocyte count but with positive lack of transillumination, the mastoid cells were found to contain pus or necrotic tissue The presence of this infected material has as far-reaching an influence on the general well-being of the body as a chronically infected tooth, antrum, tonsil or sinus, and we feel should be removed for the same reasons

Abdomen, extremities, and neurological examination were negative.

Following catheterization a chemical blood specimen was taken. Ten units of Insulin were given intravenously, at the same time ten units subcutaneously. An enema was given, a Murphy Drip of four percent bicarbonate of soda begun Digitalis was given by hypodermic, as shown in Chart No I External heat was applied Blood sugar was found to be 572 gm per 100 c c, CO_2 combining power 13 6 vol per cent The admission urine showed 3 3 per cent sugar, with 4-plus acetone and diacetic acid reactions

During the first six hours urine specimens were secured at 2-hour intervals, each being followed by the subcutaneous injection of 10 units of Insulin At the end of this period the blood sugar had fallen to 167 gms per 100 cc, the CO_2 combining power had risen to 21 1 vol per cent The clinical condition of the patient was then much improved, cyanosis had disappeared, respirations were of a more normal character, the skin had lost its excessive dryness During the next 11 hours urine examinations showed only traces of sugar and acetone bodies, no Insulin was given during this period Urine examinations were made at approximately 3-hour intervals during the following day

With the continuation of the 10-unit doses of Insulin, as indicated by the chart, the blood chemistry findings became normal the second morning after admission Additional treatments included giving several hypodermoclyses of five per cent glucose and saline, the first was given five hours after admission. The Murphy Drip of glucose and bicarbonate of soda was used almost continuously A persistent abdominal distention was treated with pituitrin, turpentine stupes, and colonic irrigations Digitalis was continued until the pulse had become normal in rate and quality

Dietary management of this case consisted in giving 4 ounces of orange juice with the Insulin as soon as the patient was able to swallow and retain fluids by mouth Milk was added later On the second day of feedings by mouth Dr Mosenthal's "Diabetic 2" diet was given * The fourth day this was increased to the "Diabetic 3" diet, the maintenance diet used before admission, which consists of carbohydrate 60 grams, protein 45 grams, fat 105 grams The interval between Insulin injections was gradually increased until the original 15-unit doses were given twice daily, with no glycosuria and no loss of weight.

Case No 2

B K, female, age 44 years, admitted October 15, 1926 This patient had been known to be a diabetic for two years, she was on a prescribed diet but took no Insulin Periodic examinations of the urine had shown only traces of sugar, no previous chemical examinations of the blood had been done A gradual onset of weakness for two years was accompanied by failing vision and a loss of weight of 30 pounds During the six months prior to admission dyspnea and fatigue resulted from any exertion, thirst increased, and polyuria developed Anorexia had been present several weeks For 24 hours before admission severe epigastric distress and vomiting followed taking anything by mouth, dizziness and a drowsy sensation gradually gave way to a comatose condition

Physical examination showed a small woman, very emaciated, with extreme dehydration Respirations were of a deep sighing character, rate 24, breath was acetone in odor Tongue and lips were dry and bright red There was generalized flaccidity, no apparent paralyses, pupils were equal and reacted to light Heart was negative except for a rate of about 130, lungs, abdomen, and extremities were negative.

Examination of the urine showed two per cent sugar, with strong acetone and diacetic acid reactions Insulin was given immediately, 20 units intravenously and 20 units subcutaneously Chemical blood analysis showed a sugar of 410 gm per 100 cc, a CO_2 combining power of 12 4 vol per cent Five subsequent injections of Insulin, each of 20 units, were given at hourly intervals following examinations of the urine An infusion of 600 cc five per cent glucose and saline was given with the Insulin on admission, four hours later an infusion of 300 cc five per cent bicarbonate of soda was given A Murphy Drip was begun on admission, a hypodermoclysis given with Insulin 12 hours later, as shown in Chart No 2

The patient was first seen at four o'clock in the afternoon, four hours later she was able to take water by mouth The following day her condition was much improved, only occasional vomiting followed feedings of orange juice or milk. Urine examinations were made at this time every 3 hours, followed by injections of 20 units of Insulin Blood chemistry determinations done 24 hours after admission showed a blood sugar of .208 gm per 100 cc, a CO_2 combining power of 48 vol per cent. The following day the Insulin dosage was reduced to 10 units every three hours, with which the CO_2 combining power rose to 57 vol per cent in 24 hours

After the second day the Murphy Drip was discontinued, fluids were then forced by mouth Bicarbonate of soda, 20 grains, was given by mouth three times a day On the third day

* Tice System of Medicine, Vol. 9, page 120

ing respirations, rate 24, with a frequent cough There was a marked acetone odor to the breath, tongue was beef red, the throat congested Examination of the chest showed the heart to be negative, rate about 160, the lungs had only scattered moist rales at the bases

Case No 3

A H, female, age 66 years, admitted in coma, March 3, 1927 A known diabetic for many years, she had neglected the prescribed diet and Insulin, had voluntarily taken periods of fasting, and had lost about 35 pounds in weight in the past year There had been a severe non-productive cough for a week, with fever and continuous vomiting for four days before admission Respirations had been labored 24 hours, with Cheyne-Stokes breathing An attack of acute cardiac decompensation occurred four hours before admission, when

sumption an exciting matter, but it is nevertheless an important one

Somewhat as the painter told the art student to 'mix his paints with brains," so the physician will seek to inspire the nurse or the mother to use intelligent thoughtfulness in securing and maintaining the liberal consumption of milk which is so important to the best development of the child

The milk need not all be taken as such, much of it may be used in the preparation of the child's other foods, and used too, if desired, in dried or other concentrated form to save bulk But a liberal intake of fluid with meals is now-a-days considered desirable, and if even a fourth of the milk is used in other forms, only one full cup of milk at each meal need be consumed in fluid form, and if this is not gulped down rapidly but rather sipped throughout the meal, it will not prevent the child from eating with good appetite all the other foods which should also enter into the diet This should regularly include some hard food such as dried or toasted bread to exercise the teeth and gums, and fruits and vegetables partly among other things for additional exercise in chewing and partly for their vitamin C and iron contents, together with an occasional egg-yolk or entire egg and such meat foods as the physician may deem wise in each case

Important as are vegetables for other reasons, it has been found unwise to rely upon them to furnish any large share of the calcium needed by growing children Very careful efforts could not satisfactorily substitute vegetables for even one-half of the daily quart of milk [3]

Space need not be taken here to set forth actual dietaries and meal plans for children of different ages, especially when this has been so excellently done by Professor Mary S Rose in her very practical and readable book entitled *Feeding the Family* (Revised Edition, The Macmillan Company, New York, 1926)

That milk should continue to be an extremely important factor in the feeding of children for such a long time after weaning may at first seem surprising but becomes plainly logical as soon as one reflects upon the fact that the baby is born much more helpless than other young mammals and, with the milk of domestic animals as well as of its mother to rely on, has in the course of ages come to indulge in an extraordinarily long period of development In making milk the mainstay of the diet until the child is at least fairly well grown, we are only treating the child as well as nature treats the young mammals of other species, for these latter suckle until they are sufficiently developed to shift for themselves in competition with adults In this connection it is also of interest to note that among more primitive peoples, and in countries where the milk of domestic animals is less abundant, the ordinary duration of nursing is much longer than in America and Western Europe In parts of the Orient and of Russia, for instance, two years or more is very common, and one eminent Japanese physician told me that he had his mother s milk until he was five years old

inability of the kidneys to excrete either sugar or urine at times After this finding the Insulin was again given at more frequent intervals, with reduction in the blood sugar Administration of glucose for acidosis and for its diuretic effect was another factor in causing the blood sugar to remain high Control of the acidosis was in this case difficult, the results nevertheless positive The CO_2 combining power after 48 hours was 43 8 vol per cent, after 72 hours, 54 1 vol per cent

Clinically the patient showed improvement for several days Respirations became more normal within a few hours, dehydration was much improved, the patient was brighter and wanted to sit up Vomiting ceased 12 hours after admission, coughing was less On the third day there was a rise in temperature with signs of broncho-pneumonia in the right base, on the following day the process spread to the opposite side Dyspnea and cyanosis intervened notwithstanding repeated stimulation Pulmonary edema developed on the fifth day in the hospital, with a fatal termination

Conclusions

A satisfactory method of treating diabetic coma has been developed based on the following principles

1 The use of small doses of Insulin, usually of 20 units, frequently repeated The initial subcutaneous injection is accompanied by a similar dose intravenously, for immediate effect.

2 Urine examinations for sugar, acetone, and diacetic acid on admission and at intervals of one to two hours thereafter, preceding the Insulin injections, for the control of dosage and the determination of the interval between injections Intervals are lengthened with improvement in findings

3 Blood sugar and CO_2 combining power determinations on admission and at intervals of not more than 24 hours, during the acute stages

4 The use of glucose with Insulin in the treatment of acidosis and for the prevention of Insulin shock

5 Aiding fluid retention by forcing fluids, eliminating diuresis, and the use of saline and bicarbonate of soda

6 Treatment of cardiac insufficiency and shock by the use of digitalis, stimulants, and external heat

The author is indebted to the Attending Physicians of the New York Post Graduate Hospital for the use of the above cases, and to Drs H O Mosenthal and Milton A Bridges for suggestions in regard to the text

CALCIUM REQUIREMENT AND DIET DURING GROWTH

By H C SHERMAN, COLUMBIA UNIVERSITY, NEW YORK CITY

BY a long series of careful experiments with children from 3 years to 13 years of age, it was found that, throughout the entire range of age studied, the development of the child as indicated by the storage of calcium and phosphorus in the growing body was improved with increasing intake of milk up to one quart per day for each child A day's dietary containing a quart of milk together with such other foods as are normally fed will furnish about one gram of calcium, and it is largely (though by no means exclusively) for the purpose of ensuring this liberal intake of calcium to meet the growth requirement that most authorities now very properly emphasize the importance of a quart of milk per day for every child[1] throughout the years of its rapid growth

Although children may appear to do well with a lower allowance, it is only by maintaining the standard just mentioned that an optimum storage of calcium and phosphorus and an optimum development of bones and teeth can be ensured

The discovery of the antirachitic vitamin D, of its abundant occurrence in codliver oil, and of its influence upon the "mobilization" of calcium and phosphorus in the body, naturally suggested the question whether the feeding of codliver oil would permit the growing body to effect an optimum storage of calcium upon a lesser calcium intake This was tested by comparative experiments upon growing animals (rats) which were killed and analyzed for calcium at the conclusion of the experimental period[2] It was found that with a dietary which may be roughly compared with the feeding of a pint of milk per day to a child of from 3 to 13 years of age, development was to all appearances normal but the calcium content of the body remained below the optimal, it was not appreciably increased when codliver oil was fed, but did increase to the optimal when the calcium intake was increased by doubling the milk supply or by adding calcium in the form of an easily assimilable calcium salt In normal feeding of children the carefully regulated use of calcium salts is, of course, not practicable, but the liberal feeding of milk is feasible, even though it is sometimes necessary for the physician to educate the mother and for the mother to patiently train the child The so-called natural appetite of the child is a far less serviceable guide than is the scientific evidence now available Children often require training in food habits, as in others The "melancholy mildness" of milk does not make its con-

CONFERENCE ON THE CARE OF CRIPPLED CHILDREN

The Committee on Public Relations of the Medical Society of the State of New York accomplished a progressive piece of work on January sixteenth when it formed tentative agreements regarding the relations of the medical profession to the leading state agencies which are engaged in giving medical service to the people

Last year the Committee solved the vexing problem of the relation of physicians to the lay health organizations, and the allocation of spheres of work and influence to each group The Committee has now completed a series of tentative agreements with the official health agencies by which physicians will perform services for the State on a basis similar to that of physicians in private practice

The occasion for the present agreements was a conference on the administration of the new law for the relief of crippled children, which authorizes the State to provide the means for correcting the defects of every child that is physically handicapped The State Department of Education and the State Department of Health are charged with the administration of the law, but the leaders of these two departments recognize the fact that the greater part of the actual relief must be given by practicing physicians The public health nurses and social health workers of the two departments will discover the cases and persuade them to submit themselves to treatment They will furnish transportation to the examining offices and laboratories and maintenance in the hospitals But the law goes a step further than any previous one, for it provides for the payment of the physicians treating those persons who cannot pay for the treatment without imposing an undue sacrifice on other members of the family The law provides for the payment of the doctors by the counties on the certification of the County Judges or the Judges of the Children's Courts These Judges have already asked the State Department of Health to suggest a scale of fees for the various operations and treatment, in order that they might have the means for estimating the value of the medical services

The members of the Public Relations Committee first discussed the proposition from every angle, as was their duty Entering into agreements with the State officials might open the door for the dominance of the State over the private affairs of doctors and their patients and might be a step toward the employment of doctors to treat all forms of sickness in all persons—in other words, it might lead directly to socialized, or state medicine

The members of the Committee also recognized the need of the State to provide the means of relief and correction for those individuals who otherwise might be a burden on the State The members of the Committee did not question the duty of physicians to supply the medical services, but they recognized the probability that the correction of crippling defects would not be accomplished unless the State assumed the leadership of the work Nor did the physicians seek special remuneration for their services, but pay was offered to them by the State authorities, just as it is offered to law makers, and school teachers, and anyone else who works for the State The physicians were absolved from all suspicion of self-seeking in entering upon a conference regarding their fees

However, it seemed wise that the Committee should make a clear statement of the economic principles on which the regular agreements with the State should be founded These principles, which are printed on page 170, rank in importance with those on the relation of physicians to voluntary health organizations, which were adopted last spring (See page 1433 of this Journal of December 1, 1928) These principles were accepted by the State Department of Health and Education, thereby removing the implication of State Medicine in the administration of the new law

The further agreement was reached unofficially, that the Committee on Public Relations should always be ready to give advice to any department of State Government regarding plans and methods of supplying any form of medical service which the State may need to adopt The agreement went so far as to assert the principles that the State should consult the Committee on Public Relations while developing their medical plans thereby avoiding the ancient friction which has arisen when the State makes plans by itself, and then tells physicians to abide by them The importance of these agreements cannot be overestimated

Having adopted the principles of action there remained only the question of the proper remuneration of physicians who give their medical services on the authority of the State Here the natural modesty of the profession asserted itself, and the State authorities evaluated medical services higher than the doctors themselves had assessed them The tentative fee list that was suggested is printed on page 171

There was considerable discussion over the wisdom of the plan that the State Medical Society should suggest the fee list, some members of the Committee thinking that each County Society should make its own scale, and others that the price should be left to the individual doctors, but the view prevailed that it would be unfair to the county

EDITING AND REPORTING

The duties of an editorial office include reporting, or the collection of news from the field The officers and committeemen of the Medical Society of the State of New York and the constituent county societies constitute the reporting staff of the New York State Journal of Medicine, and their descriptions of activities are found in the news department of every issue of the Journal

The editorials consist principally of comments on the news items and emphasize the art of practising the principles and methods evolved by medical leaders and described in the news section They are closely linked with the news department of this Journal, and each one has been submitted to the officer who is especially concerned with the news item on which it is based

MEDICAL PROGRESS

Chemotherapy in Surgery—W Krech, of the Breslau Surgical Clinic enumerates a great variety of internal remedies which are used in purely surgical conditions It may suffice to mention the indications which these substances are supposed to fill Locally acting disinfectants may be passed over in this connection Under internal disinfectants we have a great variety, beginning with various metal colloids, into nearly all of which silver enters Next are mentioned drugs of the urotropin type. The next group mentioned comprises the intravascular hemostatics, the free use of which is believed by some to favor the development of thrombosis and embolism following surgical intervention The third group is employed essentially for circulatory failure, although some of the members are of value for other indications Thus suprarenin is both styptic and stimulant Some drugs nominally rated as internal antiseptics are also placed here as members of the hexamethyls Several others are of the camphor type In a fourth group are placed such substances as diminish coagulability and possibly tend to prevent thrombosis Here belong quinine derivatives, camphor-like substances, menthol and eucalyptol, urethan, etc A fifth group is devoted to offsetting the bad results from removal of the thyroid and especially the prevention of tetany A sixth group is intended for the treatment of varices, blood-vascular tumors, etc, while the seventh is made up of the intravenous remedies for inoperable malignant disease The eighth group is made up of antidiabetic remedies, and the ninth of substances used in connection with orthopedic operations Finally a last or tenth group is devoted to substances which favorably influence the healing of fractures—*Deutsche medizinische Wochenschrift*, Nov 23, 1928

Relation of Internist and Practitioner to the Cancer Problem—David P Barr calls attention to the heavy responsibility which rests upon the internist and the practitioner both as to the correct diagnosis in most early cases of cancer and as to the proper prognosis and advice concerning treatment To meet this responsibility great knowledge is necessary, while the opportunity open to the internist and practitioner is far too limited With the increase of the relative importance of cancer and the awakening of the public it is more necessary than ever before that all our knowledge concerning early diagnosis and efficient treatment shall be readily available to the public and shall be supplied by the practitioner Other reasons for increasing interest are the development of methods of tissue culture and contributions to the knowledge of the chemistry of tumor cells, which constitute an enormous advance These chemical and biological studies may well occupy the interest of the practitioner The practical management of cancer has undergone a fundamental change through the developments in the use of the *x*-ray and radium Lip cancer is now seldom operated upon, and the opinion is quite generally held that radical surgery is never desirable at any stage in cancer of the cervix. The latest statistics seem to indicate that the results with radiation in these forms of cancer are quite as good as the best of the previous surgical records Unfortunately, this important knowledge is not as widely diffused as it should be With the developments in irradiation, the relation of the internist and practitioner to cancer has changed materially The question, "Is the patient operable?" is no longer sufficient One must ask, "Should there be an operation, or should the treatment be by radiation? Should they be combined? How may radiation be best applied?" For the correct answer most careful and extensive study and a large and varied experience are necessary The question of cancer control has also an important public health aspect It is high time that the internist and the practitioner participate in the preventive work to conquer this disease—*Southern Medical Journal*, Dec, 1928, xxi, 12

Undulant Fever Caused by Bang's Bacillus Abortus—N Sjoerslev of Copenhagen refers to the dubious relationship of the two disease processes in the actual clinic—for each affection seems to maintain an autonomy—and cites various figures of the incidence and relationship of the two in various parts of the world with bacteriological studies, seroreactions, etc His personal experience with undulant fever is limited to 7 cases treated in Professor Faber's University Medical Clinic Three of these are quoted in detail The first patient was a previously sound man who seemed to have been attacked by a typhoid or paratyphoid fever, but when agglutination tests were applied the reaction to these diseases was negative, while it was positive to Bang's bacillus It appeared that he had drunk milk from a sick cow In the two other cases the diagnosis of undulant fever was made entirely from the positive agglutination test with Bang's bacillus and the fact that both patients had drunk raw milk from infected sources In summing up, the author states, without any reference to the classical Malta fever, that the *Bacillus abortus* Bang, known to cause infectious abortion in cattle, is at the same time able to cause a disease in man sufficiently like Malta fever In regard to

Judges if they were compelled to fix medical fees without the sanction of the doctors themselves Morover, it was considered that since the administration of the law would be Statewide, and by the State, the fee should also be uniform throughout the State and therefore should be suggested by the State Medical Society

The conference was a demonstration of what a consultation should be when considering a case involving the practice of public health and civic medicine The conferees devoted six hours of hard work to the discussion of the diagnosis and treatment of the condition which was presented to them They weighed the difficult diagnoses carefully and considered the various ultimate results of treatment, varying from the expectant to a radical operation The results will doubtless be satisfactory to the medical profession, the State officials and the public

This conference in the opinion of every medical man present was one of the most valuable that has been held It reflected the experiences of many men, and brought to the surface special information not known professionally to all of the groups It aroused free discussion and brought together the common points of agreement It did more to advance co-operation between governmental agencies and the medical profession than anything hitherto undertaken The Public Relations Committee believes that this conference should remove some of the still existing fear of State Medicine It believes also that the medical profession has taken another step toward establishing a proper professional attitude toward public welfare

EDITING ADVERTISEMENTS

The editorial Board and the Publication Committee of the NEW YORK STATE JOURNAL OF MEDICINE are gratified with the numerous requests which they have received for advertising space They have adopted the policy of editing the advertisements as they edit the scientific articles and news items They believe that manufacturers of drugs and therapeutic appliances are actuated by motives which are honorable and commendable, and that the ethical medium for reaching the public is the medical journals, rather than the lay press

The most frequent editorial change that advertising copy needs is that regarding extravagant claims, which, however, are often based on printed statements made by prominent physicians in accepted text-books and reputable medical journals The editors of the NEW YORK STATE JOURNAL OF MEDICINE are expected to guard against extravagant statements in the body of the JOURNAL, and they will perform that same editorial duty with advertising copy

Advertisers are invited to submit their copy to the editors a week or two in advance of its intended appearance, in order that the editing may be mutually satisfactory It is rare that a writer of a scientific paper objects to editorial criticism It is equally rare that an advertiser objects to editorial suggestions

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Ergot in Drug Habits—This JOURNAL of February, 1904, contains a brief account of a meeting of the New York State Medical Association, at which Dr Alfred T Livingston, of Jamestown, N Y, gave a paper on ergot in alcoholism and morphinism The following abstract of the paper is taken from the JOURNAL

"One of the papers covering considerable original work was presented by Dr Alfred T Livingston, of Jamestown, N Y, entitled 'Ergot in Alcoholism and Morphinism, and the General Class of Drug Habit Cases' The doctor stated at the outset that he did not consider morphinism and alcoholism as diseases *per se*, but that the continued use of these drugs is followed by a dilatation of the arterioles, particularly after the discontinuance of the drug, and it is in this condition that ergot comes in to counteract the effects of this indulgence He does not believe in 'tapering off,' but stops the drug at once, teaches the patient that he can do without it—for moral effect—gives ergot, and the patient is often surprised to find the statement of his attendant true

"To quiet the nervous system and induce sleep, he finds the cold bath, galvanizing the spinal and cervical region, using ten to fifteen milliamperes of current for fifteen minutes, of great service He also finds the static spray for one-half hour, dry-cupping the spine and the neck, also massage, to be of greatest relief to the troublesome insomnia accompanying these cases In addition to the use of ergot he advises free feeding with liquid beef and the whites of eggs at frequent intervals

"His method of administration of ergot is to make a solution of the extract, one dram to the ounce Of this injects one-half dram three to ten times per day, depending upon the requirements of the case"

bring about or favor the development of cardiovascular-renal mischief Although the present author does not commit himself to any final conclusions, he seems very skeptical about deficiency symptoms, for the great majority of the hysterectomized patients seem to be satisfied with the results of the operation and the few who are not seem a special group with a certain preoperative makeup Study of the author's material shows that increased weight and blood pressure affected only a minority and not in a marked degree—*Schweizerische medizinische Wochenschrift*, November 17, 1928

Relations of the Status Thymicolymphaticus to the Endocrine System—Professor Ad Oswald of Zürich writes what ought to be a timely article on this subject The enlarged thymus apparently forms a connecting link between endocrine disorder and hyperplasia of the lymphatic system The clinical earmarks of the status lymphaticus do not coincide with those of a polyglandular incretory affection, nor do the dreaded sudden deaths attributed to the first-named condition find any decided parallel in the latter (although some subjects with Graves's disease succumb readily to operative shock) Experience of the late war seems to have confirmed the old belief that there is a notable relationship between this status lymphaticus and unexplained death In such cases good nutrition is often emphasized as present, while conversely in the average death in hospitals, asylums, and the like, where previous emaciation figures, the thymus shares in the general reduction in size Other puzzling finds are reported, such as those of Wiesel and Hedinger, in which the so-called thymus death occurred in patients with a hypoplasia of the endocrine system Apparently the more we delve into the ramifications of the relationship in question the more atypical are the findings It is very obvious that the earlier observations were quite lacking in proper control material, while a fallacy is doubtless involved—in the author's opinion in ranking the thymus as a true incretory gland with over- and under-function possibilities It will probably be necessary to begin a new superstructure Thus a large thymus and an overdeveloped lymphatic system are constantly found in agenitalism—in castrates eunuchoids, and the subjects of dystrophia adiposogenitalis The same is encountered in Addison's disease, but only at times, and we know the close relationship between the adrenals and gonads So-called thymus death is a special, hardly related problem—*Schweizerische medizinische Wochenschrift*, December 1, 1928

The Relation of Arthritis of the Sacroiliac Joint to Sciatica—W Yocman observes that the many views on the causation of sciatica have one item in common, a recognition of a lesion in the lumbar and sacral region, indicating a tendency to regard sciatica as a symptom and not a clinical entity, with attention focussed on the roots of the nerve rather than on the trunk He presents an analysis of 100 cases with a diagnosis of sciatica, in all of which roentgenograms of the sacroiliac and lumbosacral joints were taken In 36 per cent of these arthritis of the sacroiliac joint was demonstrated The symptoms are due to a periarthritis involving the sacroiliac ligament, the pyriformis muscle, and the adjacent radicals of the sciatic nerve, chiefly the first and second sacral nerves The diagnosis can be made with a reasonable degree of certainty on the wasting and loss of tone in the glutei, Kernig's sign, and hypertension of the hip The x-rays confirm the diagnosis in many cases by showing spur formation, indistinct outline, or fusion of the sacroiliac joint There is always a loss of tone in the glutei if a lesion of the sacroiliac joint can be demonstrated by the x-rays Rectal and vaginal examination is important, as by this procedure it is possible to palpate the sciatic nerves and the lower margins of the sacroiliac joints, and to eliminate carcinoma of the prostate or any gross intrapelvic lesion Treatment should follow the course indicated in arthritis or periarthritis of other joints of the body The author has found the sulphur bath with subaqueous douche most valuable This may be followed by the Scotch douche or a massage douche bath when the acute pain has subsided, in the acute or subacute stage massage aggravates the condition In conjunction with this, sulphur water by mouth insures a complete daily evacuation of the bowels, and in suitable cases colon lavage with sulphur water is employed For the acute cases nothing is so beneficial as intravenous non-specific protein, preferably typhoid-paratyphoid vaccine, with which the results have been even more encouraging than in generalized infective arthritis Strain of the sacroiliac joint may be a predisposing factor in the condition, but in the writer's experience is not a common sole cause of sciatica—*The Lancet*, December 1, 1928, ccxv, 5492

The Importance of Sleep in the Treatment of Acute Disease—J Wayne Carr cites the case of a woman, aged 65, with advanced general bronchitis, who was exhausted and in a wellnigh hopeless condition She was given 1/6 of a grain of morphine and 1/100 of a grain of atropine and while she slept was kept alive by oxygen given through a tube passed directly into the nostril He believes that had rest not been secured in this way she would inevitably have died The rule that one should not give morphine to an elderly patient with advanced general bronchitis is no doubt excellent, but, like all others in medicine, must not be adhered to blindly The morphine

differential diagnosis the general good condition is in striking contrast with the temperature and the continued or recurrent fever Despite the tediousness of the disease, the prognosis remains good Diagnosis is made through the agglutination test and the cultivation of the bacillus from the blood If we fully comprehend the purpose of the paper it is to show that while classical undulant fever is not recognized in Denmark, the pseudotyphoid which has followed the drinking of raw milk and which has been unmasked by serological tests is none other than the so-called "Mediterranean fever" of milder climes, which has been traced to the *Micrococcus melitensis*—*Deutsche Medizinische Wochenschrift,* November 16, 1928

The Conception of "Dysfunction" in Endocrinology—Professor A Oswald of Zurich states that the introduction of this term goes back to Moebius while the word itself is the result of a dilemma If symptoms associated with the removal or disease of an incretory gland represented neither an excess nor diminution of hormonal activity one could perhaps speak of a perversion of function This point of view receives some support from the behavior of certain glands of external secretion Thus sometimes the pyloric glands in place of too much or too little pepsin, have been known to secrete trypsin Numerous examples of this type have been assembled, but, in some cases at least, another explanation than that of dysfunction is possible In the pyloric glands for example there may be a sort of metaplasia of enteric glands into the cavity of the stomach In any case corresponding phenomena have not been seen in incretory glands although this does not mean that they cannot occur In the case of the thyroid the author expresses the opinion that all known disease phenomena may be explained on a quantitative basis alone Whatever might be said of other incretory glands the author is certain that there is no known dysfunction of the thyroid Even the most complicated conditions associated with thyroid trouble, as cretinism, do not need this hypothesis The second gland of importance in this connection is the pituitary, and here the word dysfunction is often heard, but several active principles are concerned and the pituitary is seldom involved alone The author can find no basic fact or theory for pituitary dysfunction It is also impossible to fasten a dysfunction upon the thymus, for we know nothing of its hormone and any endocrinic disturbances are due to involvement of some of the other incretory glands—*Muenchener medizinische Wochenschrift,* Nov 9, 1928

Relationship of the Endocrine System to Oto-Rhino-Laryngology—Dr Leicher of the Frankfurt University Clinic enumerates many points of contact It is known for example that diphtheria (its toxin) exerts a deleterious effect on the adrenals and hypophysis This is expressed clinically, in part at least, by the cardiac failure, low blood pressure, etc Injections of both adrenalin and pituitrin are of value at this stage of the disease It should not be understood that there is anything actually specific about this action for other bacteriotoxins may exert the same effect. Both acute and chronic tonsillitis and suppuration in the nasal sinuses may give rise to changes in the thyroid and thymus which are not necessarily deleterious, for sometimes a cure of thyroid struma has followed the removal of these throat and nose lesions Only in passing may be mentioned that carcinoma of the larynx and esophagus may invade the thyroid, just as infection and neoplasms in the sphenoidal sinuses may sometimes attack the hypophysis The relationship between the olfactory area and the gonads seems deep-seated and it is agreed that cocainization of the nasal mucosa may affect favorably the menstrual function, when it is disorganized In this connection may be mentioned the effect of puberty on the development of the larynx, and many patients with otosclerosis trace this disorder to the period of puberty Pregnancy and even menstruation exert certain effects on the upper passages too numerous to detail, as does also the climacteric —*Klinische Wochenschrift,* November 18, 1928

Deficiency Symptoms After Removal of the Uterus With Ovaries Retained—P Jung, gynecologist of the Cantonal Hospital of St Gallen, has investigated this subject by following up all of his patients who had been submitted to total hysterectomy, supravaginal amputation, and enucleation, his theory being that deprivation of all or most of the menstrual area might give rise to a definite symptom picture He could investigate personally only some 73 of these women, which number makes up 20 per cent of the whole The remainder filled out a blank devised and submitted by him Just one-third had no complaint to make and were satisfied with the operation Some 60 per cent complained of the ordinary vasomotor and nervous symptoms of a mild degree but were satisfied, and 7 per cent only showed a high degree of unpleasant symptoms The age of the women was no measure of the consequences The number of women to present evidence of deficiency symptoms was 25 In a majority of this number there was evidence of psychopathy before the operation Those who have written most recently and extensively on this subject, as Aschner and Erdmann, have reasoned that ablation of the menstrual area can result in the retention and cumulation of some toxic substance, probably the menotoxin of Schick, or that the disturbance of the hormonal balance tends to

Counsel, Medical Society of the State of New York

THE SUBPOENA AS APPLIED TO THE DOCTORS OR NURSES OF A CHARITABLE HOSPITAL

We have received so many inquiries as to the law concerning the subpoena as applied to physicians and nurses of charitable institutions, that we have deemed it proper to set forth our views for the benefit of the entire profession

Thirty-six years ago, by virtue of Chapter 295 of the Laws of 1893, the following provision was added to Section 836 of the Code of Civil Procedure, which now forms a part of Section 354 of the New York Civil Practice Act "In an action for the recovery of damages for a personal injury the testimony of a physician or surgeon, or of a professional or registered nurse attached to any hospital, dispensary or other charitable institution, shall be taken before a referee appointed by a judge of the court in which such action is pending, provided, however, that any judge of such court at any time in his discretion, notwithstanding such deposition, may order that a subpoena issue for the attendance and examination of such physician or surgeon or professional or registered nurse, upon the trial of the action In such case a copy of the order shall be served together with the subpoena"

This section is of peculiar interest to the profession, especially to the physicians and surgeons or registered nurses attached to charitable hospitals In substance, it provides that physicians and nurses in this category shall have their testimony taken before a referee instead of in open court The law, however, provides that a judge may at any time in his discretion, even though such deposition has been taken, order that a subpoena be issued for the attendance and examination of such physician, surgeon or registered nurse, in which case, however, a copy of the order must be served with the subpoena

To what kind of actions does this section apply? The law is specific upon this subject, it says "In an action for the recovery of damages for a personal injury" The words "personal injury" have been defined by Section 37-a of the General Construction Law as follows "'Personal injury' includes libel, slander, criminal conversation, seduction and malicious prosecution, also an assault, battery, false imprisonment, or *other actionable injury to the person either of the plaintiff, or of another*" Although not specifically enumerated, in our opinion actions for malpractice would fall within this category

Having examined this section, and having determined what it means, the question arises as to what, if any, practical advantage it holds out to the members of the medical profession or nursing profession embraced within its terms The statute was undoubtedly designed to alleviate the inconvenience constantly suffered by physicians who attend injured patients in charitable hospitals, and who thereafter are subpoenaed to testify concerning those injuries in court. To us, however, frankly the provisions of the statute seem to offer little practical advantage to the medical profession The expenditure of time and effort in appearing to give testimony before a referee appointed by a judge, is little if any less onerous than that involved in appearing at the trial Still, perhaps depositions taken in this way might be taken at a time more convenient to the physician than would be the attendance in the courtroom, as such matters can usually be worked out by arrangement between counsel and the referee

There might, however, even be a disadvantage in this provision, for despite the fact that a deposition has been taken, a judge may still order a subpoena to be issued for the attendance and examination of the physician "upon the trial of the action" Thus, it may happen that a physician could be first required to appear before a referee and there give his testimony, and might thereafter still be ordered to appear and testify in court, thereby necessitating two appearances instead of one The likelihood of this, however, is not great, for no doubt in the majority of cases where the physician has given his testimony before a referee, the additional order requiring him to appear and testify in open court would not be made

The question has been asked as to whether or not a physician or registered nurse attached to a charitable hospital, if subpoenaed in an action for personal injuries, could refuse to obey an ordinary subpoena unless such subpoena is accompanied by an order of a judge, which order is likewise served with a subpoena In our judgment, a physician or registered nurse "attached to any hospital, dispensary, or other charitable institution," would be justified under the law in refusing to obey a subpoena in a personal injury action directing him to testify as to any information which he acquired in attending a patient in a professional capacity in such hospital dispensary

was given by mouth because it seemed likely that its action would be more gradual and therefore safer than if it were administered hypodermically In many forms of heart disease morphine as a narcotic is still more generally helpful Its value in advanced cases of aortic diseases is generally recognized More hesitation is felt in giving it to patients with mitral disease, but it need not be feared Sound sleep is as valuable a tonic to a fibrillating heart as is digitalis, and at times probably even more valuable, for the action of digitalis or any other heart tonic is more effective and more lasting if the patient can enjoy at the same time the beneficial effect of restful sleep The early stage of acute pneumonia affords another example of the beneficial effect of morphine or opium In the later stages the use of an opiate in elderly persons is undoubtedly attended by considerable danger of respiratory failure, but during the first two or three days it will greatly diminish the strain on the patient's strength and conserve his vitality None of the milder synthetic hypnotics is so reliable or so lasting as an adequate dose of morphine or opium There is also a real danger of patients acutely ill being overfed by the modern trained nurse She is not taught sufficiently to realize that while the patient needs food by day, quiet and sleep are the essential factors to aim at by night It is a mistake to try to feed a patient on a fluid diet every two hours both by day and by night —*The Lancet*, December 8, 1928, ccxv, 5493

The Etiological Relationship of Chronic Appendicitis and the Small Cystic Ovary —Having observed some years ago that chronic appendicitis was often associated with tender and enlarged ovaries of the small cystic or hyperplastic type, and that apparently the right ovary alone was affected oftener than the left, Kelley Hale had his pathologist inspect and record the gross appearance of ovaries at the operating table Of 256 cases of chronic appendicitis 76 per cent were associated with the small cystic ovary, on one or both sides, and 24 per cent were unassociated with this condition In 28 per cent of these cases the right ovary alone was affected, in 6 per cent the left ovary alone, and in 66 per cent both ovaries were affected When both ovaries were involved, the right was usually larger than the left—a striking and significant observation Hale feels that an enlarged and tender right ovary, nonspecific, means chronic appendicitis, even though the appendix is not tender, and that operation is indicated In many cases removal of the appendix as the source of toxic and infective irritation of the ovary is all that is required, however, in patients with tender ovaries, dysmenorrhea, nervous and exaggerated gastric and reflex symptoms, some type of surgery is needed—puncture if only a few cysts are found, plastic for large prolapsed organs, and where there are many cysts either subresection or removal of the ovary While it is generally known that acute appendicitis can produce ovaritis by contiguity or by infection being carried through the lymph channels in Clado's ligament, the possibility that chronic appendicitis has any action deleterious to the ovary is scarcely mentioned in the literature Hale states that he has demonstrated to his own satisfaction the existence of Clado's ligament, which has been denied by some He presents microscopical studies demonstrating the effect of the diseased appendix upon the peritoneum and shows that the ovaries react by a more or less thick tough white cortex which is the cause of the failure of the graafian follicle to rupture at maturity, and a retention cyst results —*Annals of Surgery*, December, 1928, lxxxviii, 6

Pathogenesis of Sudden Death —Prof R. Jaffe discusses this interesting but unsatisfactory subject from the standpoint of a pathologist who has made autopsies on 73 patients during the past two years when death was not only sudden but could not be associated at once with a casual factor Autopsy sufficed to eliminate a certain number of cases in which the mechanism of death was perfectly obvious—thrombosis, embolism, etc There was but a single case of so-called thymus death In 56 cases which remained it must not be understood that severe lesions were not present, but the mechanism of death nevertheless remained obscure Hypertonia, coronary sclerosis, valvular lesion, and fatty heart, may of course have been set down as causes of death, but the fact remains that no mechanism was obvious Patients with these lesions usually go on living as invalids, perhaps for years Why then in certain cases do these hearts give out prematurely and suddenly? There is in such cases no history of an act of overstrain precipitating a crisis In an advanced myofibrosis we might understand that such a heart is incompatible with continued survival, yet these hearts often carry on In sudden death in the hypertonic we may assume that the effort of the heart to overcome peripheral resistance must reach a breaking point in which the organ quits The same sudden failure also happens in coronary sclerosis although a functional factor must be invoked here as well There is a possibility that an organic lesion of the stem artery is responsible for a functional spasm of the branches beyond it If anatomical change cannot explain the sudden death it is clear that we must invoke physiological change as well It is obvious that sudden death occurs in the midst of a variety of alterations and of functional possibilities and that it is doubtless not a simple but a highly complicated affair in a large proportion of cases —*Deutsche medizinische Wochenschrift* November 30, 1928

the patient, who was living with her husband in a cellar in filthy surroundings, he found that the plaintiff was going into labor The patient had ruptured the membranes about five days previous Her temperature was 102 3 by mouth When the doctor arrived he found the patient s husband drunk The husband admitted to the doctor that he had intercourse with his wife after the membranes had ruptured The husband also told the doctor that his wife had been working around the premises not realizing that she was in labor and that they did not expect the child for a few weeks yet The doctor immediately returned to his office and obtained the necessary equipment with which to deliver the plaintiff and returned immediately to the plaintiff's home Upon his return the plaintiff's labor pains were not as severe as they were on his first visit and as the cervix was fully dilated, the defendant felt that a hypodermic of pituitrin was necessary The husband refused to permit the doctor to administer this stating that upon the birth of a previous child the plaintiff wife had had pains following the administration of this drug The doctor then called in another physician, and after both physicians had scrubbed up and put on sterile gloves, the defendant proceeded, with the aid of the other physician, to deliver the plaintiff The doctors delivered the plaintiff of twins The placentas were expelled in a normal way During the delivery the husband objected to the doctor's method of delivery and constantly interfered with their work No instruments were used during the delivery and there was only one vaginal examination prior to the delivery by the defendant, and before this was done the defendant placed a sterile glove on his hand A neighbor of the plaintiff was present and said she would take care of the patient and the children The doctor gave instructions to have an ice bag applied to the lower abdomen and to raise the head of the bed and also to have fluid extract of ergot administered to the plaintiff wife. The doctor left about three o'clock in the morning stating that he would return the following day

The doctor returned about eight o'clock the next morning and found the woman running a slight temperature He also found that instead of an ice bag a hot water bag had been applied to the abdomen of the plaintiff He remonstrated with the plaintiff and her husband and they stated that the ice bag was too cold and they wanted a hot water bag The husband also stated that he had given his wife argyrol instead of ergot The defendant returned in the afternoon of the same day and arranged to have a settlement nurse come and take care of the wife and children The next morning upon the doctor's return he found the wife with a temperature of 103 and that his instructions had again been disobeyed in that the hot water bag was again applied to the plaintiff's abdomen instead of the ice bag The surroundings were so filthy and the doctor finding that his instructions would not be obeyed sent the plaintiff and her children to a hospital and did not thereafter render any treatment to them

Subsequently an action was begun against the doctor by the husband and wife charging that the doctor so negligently and unskillfully treated the plaintiff wife that she became infected and developed blood poison Upon the trial and at the close of the plaintiff's case, the court, upon motion of the defendant's counsel, dismissed the actions

---

CLAIMED CONSPIRACY TO COMMIT TO INSANE ASYLUM

In this case a young married woman brought suit against her mother and the defendant physician, and several other persons, claiming that the defendants had conspired to commit her to an insane asylum The specific charge against the defendant physician was that he had aided and assisted the other defendants by forcibly injecting morphine into the plaintiff's body so as to render her incapable of resisting the efforts of the other defendants to place her in a Sanitarium or Asylum

When the defendant doctor was first called to see the plaintiff he found her in bed in a state of intoxication He was given a history that the plaintiff for a long period of time had been accustomed to the excessive use of alcohol The doctor prescribed bromide and chloral by mouth and gave the patient a hyperdermic of 1/10 grain of apomorphine Despite the doctor's instructions the patient persisted in the use of alcohol, and on some occasions she became so boisterous that it was necessary to give her a hypodermic of morphine The doctor saw the patient daily for about a month and a half At the end of this time the doctor discontinued his visits but about two weeks later he was again called to see the patient by her mother He found her in a very

or other charitable institution We find no judicial interpretation supporting this opinion, but we believe the language of the statute is clear It is mandatory in form, it says that the testimony of such a physician "*shall* be taken before a referee," etc We feel, however, that there would be little practical advantage for a physician in declining to obey a subpoena in cases of this kind as, were he to refuse to obey it, the judge could, and undoubtedly would, issue an order requiring him to appear and testify in open court

This, we believe, is a plain statement of what the law is on this subject, and it will answer many inquiries which have been directed to us

CLAIMED NEGLIGENCE IN INJECTION FOR SYPHILIS

In this case the plaintiff, a man about 47 years of age, called upon the defendant, giving a history of suffering from angina pectoris and said that he had had a chancre when he was twenty years of age The doctor diagnosed his heart condition as due to syphilis A blood test was made showing a four plus Wassermann The defendant doctor also had electrocardiographic examination, polygraphic and X-ray studies made of the plaintiff's heart After this had been done the doctor recommended to the patient a course of twelve injections of neosalvarsan and salvarsan in graded doses, followed by twelve injections of mercury The plaintiff agreed to this form of treatment and on January 2nd the defendant gave him an intravenous injection of 45 grams of neosalvarsan On January 4th, 9 grams of neosalvarsan, on January 7th, 10th and 14th 4 grams of salvarsan were administered and on January 17th, 9 grams of neosalvarsan During the administration of these injections the plaintiff told the doctor that he felt greatly benefited by this treatment and that he was beginning to feel well after three years of intense suffering

On January 21st the patient returned to the doctor's office telling the doctor that he had been suffering from a sore throat for the last few days The doctor examined his throat and found that it was sore and consequently gave him an injection of 1 c c of oxycyanate of mercury and advised the plaintiff to return home and go to bed, the defendant at the same time suggesting suitable treatment for the plaintiff's throat condition The following day the family telephoned the doctor that the plaintiff's neck was considerably swollen The doctor promptly went to the plaintiff's home and found him suffering from a severe sore throat He immediately took a throat culture and forwarded it to the Department of Health for examination They reported the culture negative for diphtheria bacilli The doctor diagnosed the condition as a severe streptococcus sore throat and advised consultation with a throat specialist, and the defendant requested the family to procure the services of a competent throat specialist The defendant saw the plaintiff that night in consultation with the throat specialist and it was agreed that the plaintiff was suffering from a severe sore throat with odema, probably syphilitic in origin The defendant also procured a nurse to take care of the plaintiff and as the plaintiff resided at a considerable distance from the defendant's office, the defendant arranged with the plaintiff's family doctor to take care of the plaintiff until after his throat condition cleared up, when the defendant intended to continue with the antiluetic treatment The defendant doctor kept in touch with the family and the family physician and after a time was advised that the patient was improving

Some time later the plaintiff's daughter called to see the defendant and demanded that the doctor refund the money which her father had paid to him for his treatment This the defendant very properly refused to do, whereupon the daughter became abusive and stated that the doctor's treatment was responsible for her father's throat condition, and that if the money was not refunded the plaintiff would sue the doctor The defendant promptly asked her to leave his office and she did

Shortly thereafter an action was begun in which it was claimed that the defendant improperly injected a serum into the plaintiff's arm and that by reason of such injection the plaintiff became ill The case came on to be tried and at the close of the plaintiff's case the court, upon motion of defendant's counsel, dismissed the complaint upon the merits, thereby terminating the action in the doctor's favor

CLAIMED NEGLIGENCE IN DELIVERY

This case illustrates the hazards encountered by physicians in obstetrical cases where the patient has had no prenatal care and where the doctor is not called in until labor has commenced

Upon the doctor's arrival at the home of

NEWS NOTES

PUBLIC RELATIONS COMMITTEE

The Committee on Public Relations of the Medical Society of the State of New York met at the Albany office of the Society at ten o'clock on January fifteenth There were present Dr Sadlier, Chairman, and Drs Ross, Mitchell, Johnson, and Hambrook, and also Dr Trick, President; Dr Vander Veer, President-elect, and Dr Lawrence, Executive Officer

Dr Sadlier reported on the survey of crippled children being made in Oneida county by the State Department of Education and of Health, and read several communications about it, particularly one regarding misunderstandings which had arisen, but which had been settled satisfactorily

Dr Sadlier also reported on a similar survey that has been made by the Saratoga County Medical Society under the direction of Dr John R MacElroy, whose report on the physical defects of the school children of the County was printed on page 104 of the January 15 issue of this Journal

Dr Johnson said that the Committee should do the best that it could to present good medical opposition to activities leading to socialistic or State Medicine

Dr Trick recognized that the State had certain rights and was under obligation to aid in conserving the health of its citizens

Dr Mitchell said that the State had a right to make the survey The Committee on Public Relations is not opposing the survey in Oneida County, but is only taking exception to one phase of the method employed

Dr Vander Veer said that the co-operation of the Medical Society of the State of New York is desired by Dr Matthias Nicoll, Jr, State Commissioner of Health, and by Dr Lewis A Wilson, D Sc, Assistant for Vocational and Extension Education, both of whom are charged with the administration of the law for the relief of crippled children

It was decided to leave the matter of the survey of Oneida County to Dr Farrell, Chairman of its Public Relations Committee of the county, who is an excellent representative of organized medicine. It was further decided to advise that the departments of the government should consult the State Medical Society through its Public Relations Committee before undertaking any medical activity, and that the Public Relations Committee should try to activate the various county societies

It was brought out that both Dr Nicoll and Dr Wilson were anxious to find a practical way for conferring with the State Medical Society, and it was decided to tell them that the Public Relations Committee was the proper committee to consult. Dr Ross, Secretary of the Committee, was instructed to send a formal communication to Dr Nicoll of the State Department of Health, Dr Wilson of the Department of Education, the Chairman of the Legislative Committees on Public Health of the Assembly and the Senate, and the Governor of the State of New York, stating that the Medical Society of the State of New York has a Committee on Public Relations, and that through this Committee the State Society offers to co-operate with the officers in public health matters and in all other medical matters so far as they relate to other agencies concerned in rendering services of a medical nature. This communication should further state that the State Medical Society has members who are willing to give service in an advisory capacity to any department of the State government or any agency concerned with public health or welfare activity

There was a long discussion as to a schedule of fees for the guidance of the Judges of the County and Children's Courts, who are charged by law with the responsibility of fixing the fees for medical services to be paid by the counties to physicians for their services to the crippled children The schedule adopted by the State of Ohio for similar services was presented as a tentative fee list for discussion This schedule fixed minimum fees for physicians who treat crippled children under State auspices, especially for services involving surgery, casts, braces, physical therapy, and X-ray photographs

Dr Trick doubted that the Committee could commit the State Society to a schedule of fees Dr Johnson questioned the advisability of adopting any fee bill Dr Hambrook thought that we should adopt a suggestive schedule for every county of the State, and that every county should settle the matter independently through its County Society's Public Relations Committee. Dr Mitchell thought that the Committee could fix a schedule of fees as a guidance to the County Judges of the State

Dr Ross presented a communication from the State Department of Health, and the State Department of Education, stating that the County Judges wanted the advice of the Medical Society of the State as a guide to them in

intoxicated condition, and in view of the history of the case and the fact that the patient refused absolutely to refrain from the use of alcohol, he recommended to her that she go to a Sanitarium The plaintiff evidenced a desire to comply with the doctor's recommendation and was received into a private sanitarium as a voluntary patient The defendant did not treat her while in the Sanitarium and about three weeks after she had entered the Sanitarium the patient's mother again called the doctor who went to the mother's home and found the patient in an intoxicated condition He administered chloral bromide and also paraldehyde The patient was under the doctor's observation from time to time for the next eight months She refused to follow the doctor's orders and was during this period in a constant state of intoxication At the end of this period she entered another Sanitarium, and the defendant doctor never saw or treated her after that

After the case had been noticed for trial plaintiff voluntarily discontinued the action as against the defendant doctor, thus terminating the action in his favor

CLAIMED PUNCTURE OF THE UTERUS DURING CURETTAGE

In this case companion actions were brought by husband and wife The complaint contained two counts, in the first of which it was charged that the plaintiff wife had engaged the defendant to treat her and that he diagnosed her illness as a miscarriage and informed the plaintiff that it would be necessary to perform an operation upon her, and that during this operation the defendant punctured the plaintiff's uterus and injured her intestinal and abdominal organs The second count charged a wrong diagnosis in that plaintiff claimed that she was not suffering from a miscarriage She also claimed that the defendant told her that she was suffering from appendicitis which she alleges was not the fact Damages were prayed for in the sum of $20,000

From the facts it appeared that the defendant was called to the home of the plaintiff The wife gave a history of flowing for two or three weeks accompanied by pains in the abdomen, and that the flow contained clots She also stated that she missed two of her periods and further that a physician whom she had previously consulted told her that she was suffering from a cold in her ovaries On this occasion the defendant made a general examination of the plaintiff and found her temperature and pulse normal The abdominal examination was negative, except for a slight enlargement of the uterus The defendant at this time made a diagnosis of incomplete abortion He prescribed for the plaintiff fluid extract of ergot and an emmenagog preparation and told the plaintiff to remain in bed and that if she continued to flow more than another twenty-four hours to notify him

The doctor did not hear from the plaintiff until about four days later when he was called to her home On this occasion he made a vaginal examination which confirmed his previous diagnosis The uterus was dilated and the upper segment of the cervis was softened, her temperature and pulse were normal The defendant told the plaintiff wife that a curettage was necessary to remove what was left of the pregnancy The operation was consented to by both husband and wife and the defendant told the plaintiffs that this operation should be done in a hospital, but the plaintiff wife refused to go to the hospital and pleaded with the doctor to perform the operation at her home The operation was performed in the patient's home, the doctor procuring the services of a competent anaesthetist and he proceeded to operate under a general anesthesia He curetted the uterus and found products of pregnancy remaining, adherent to the wall of the uterus The operation lasted about fifteen minutes The patient was returned to bed and the defendant remained with her until she came out of the ether The doctor gave the nurse in attendance instructions to keep the patient in bed and to give her no nourishment, only a little ice if she needed it and a little water About five or six hours after the operation the doctor returned to see the patient Her temperature and pulse were normal and he gave instructions to the nurse to keep her on a liquid diet The doctor saw the patient every day for five days after the operation She flowed for about two days and on the third day the flowing stopped entirely The patient was out of bed on the fifth day and on the seventh day the defendant discharged her

About a week thereafter the patient sent for the doctor He went to her home and she complained of pain in the lower right side of the abdomen The defendant requested that they call in a physician in consultation and suggested to the patient that she go to a hospital for examination This she refused to do and the doctor never saw her thereafter

When the case came on to be tried the plaintiff failing to produce any proof showing negligence on the part of the defendant doctor, the court granted the motion of the defendant's counsel to dismiss the action

that if there was a schedule of fees, doctors would profit by it

Dr Wilson of the State Department of Education said that his Department wanted a schedule of reasonable prices that the medical profession would approve, as a guide to the County and Children's Court Judges of the State.

There was a long discussion as to the means of providing for care after operations, and it was decided that in clean surgical cases, the after-care should be included with the surgeon's fee, and that in chronic cases or long-drawn-out cases, repeated casts, physical-therapy, or any special manipulation of prolonged dressings should be paid for as extras

The Public Relations Committee, through its Secretary, Dr Ross, suggested the following fee list, which it had prepared

January 15, 1929

Free List Suggested by the Committee on Public Relations of the Medical Society of the State of New York for Medical Services Rendered by Physicians Under the Administration of the Law for the Relief of Crippled Children

T B or Osteomyelitis of foot—Incision and drainage	$35 00
Tenotomy of Tendo Achilles—Closed operation	25 00
Open operation	30 00
Plantar Fasciotomy—including cast	35 00
Arthrodesis of foot—"reshaping the foot'	35 00
Club-foot, congenital and plaster cast	35 00
Open operation	70 00
Astragalectomy	50 00
Tentomy and tendon transplantation	75 00
Bowlegs (Osteoclasis)—single	35 00
Knock Knee (Osteotomy)	50 00
Knock Knee (Osteoclasis)—single	35 00
Bowlegs (Osteotomy)	50 00
Osteomyelitis Tibia and Fibula—drainage and curettage	75 00
T B of knee joint with plaster or brace	75 00
T B of knee with resection of knee joint	150 00
Tendon transplantation anywhere	75 00
Osteomyelitis of femur	75 00
Tenotomy of hamstrings	35 00
Ununited fracture of femur	150 00
Ununited fracture of tibia	100 00
T B hip without operation—cast or brace	75 00
T B hip with operation	100 00
Congentital dislocation of hip	75 00
Each subsequent manipulation and cast	50 00
Sutter fasciotomy	125 00
Arthroplasty or Arthrodesis of hip	100 00
Subtrochanteric Osteotomy	75 00
Tenotomy of adductors	50 00
Other plastic operation at hip—100 00 to	125 00
Major operation of spine	150 00
T B spine without operation—For each cast or brace fitting	35 00
Aspiration of spinal abscess	35 00
Scoliosis—per cast	25 00
Shoulder resection or arthrodesis	100 00
Shoulder muscle transplantation	100 00
Elbow resection or arthrodesis	75 00
Elbow arthoplasty	100 00
Osteotomy of humerus	50 00
Resection of wrist or arthrodesis	50 00
Plastic operation of wrist to muscle or tendon	50 00
Tenotomy of tendon of wrist	35 00
Osteomyelitis of upper extremities	75 00
Torticollis operation—open operation	75 00
T B shoulder without operation—per cast	35 00
T B elbow without operation—per cast	25 00
Arthrodesis of knee	100 00
T B wrist without operation—per cast	25 00
Anesthetic fee minimum—simple ether	10 00
X-Ray taken—single	10 00

It was brought out that the number of cases in the State operated on last year was only one hundred and fifty, but that the number would be largely increased as a result of the survey now being made

The conclusion reached was that the fee list submitted by the Public Relations Committee of the Medical Society of the State was a fair one

Dr Wilson of the State Department of Education then discussed the Oneida County situation, and said that he and his colleagues thought that they had done the proper thing in consulting the local profession there, for they had consulted the Public Health Committee of the Oneida Medical Society and the District Health Officer, but that he now saw that they might have done more He said in the future his department would take the medical profession into full co-operation He then asked if there was any committee of the Society that he could regularly consult, and the Chairman of the Public Relations Committee replied that this committee existed for that very purpose Dr Nicoll and Dr Wilson both expressed delight with this statement and said that it removed a load from their shoulders to know just how they could go to the medical profession of the State for information at any time regarding any health activity

Dr Wilson said that the Education Law compelled the Department of Education to make a survey of the physically handicapped children of the State It was undertaking a simple census to be taken by social workers The

fixing fees, since they did not know the rates usually charged for medical services The State Department of Health further felt that the Society should suggest a schedule of fees for those cases receiving State Aid, believing that every doctor should be paid for his services The acceptance of State aid did not make the patients technically indigent Surgeons in the large medical centers are now treating these cases without charge, but a fair fee would be paid by the State if the Medical Society of the State would give advice regarding it While the older surgeons might be indifferent to the subject, it was a matter of real interest to the younger surgeons of the State.

Dr Johnson suggested that, if the Committee make a fee list, it might be committing the State Society to State medicine, so that the medical profession would be run by the Department of Education and the Department of Health Dr Mitchell thought that this Committee on Public Relations could act in an advisory way if it did not formally endorse a schedule of fees

Dr Vander Veer, at this point, suggested that the Committee formulate a statement of principles as a preamble to devising a suggestive list of fees A sub-committee then drew up the following principles which were adopted by the full committee

"Inasmuch as an invitation has been extended to the Medical Society of the State of New York, through its Public Health Relations Committee, to meet with and advise relative to the care of the physically handicapped child as outlined in Article 47 of the Education Law, the Public Relations Committee, therefore, desires to make the following statements

"Section 6 of Chapter 10 of the Constitution and By-Laws of the Medical Society of the State of New York states—'The Committee on Public Relations shall consist of five members, including the Chairman It shall be the function of this Committee to deliberate with other agencies both official and unofficial, concerning the plans, purposes and objectives of their organizations insofar as they have a relation to the medical profession No findings of this Committee shall be binding upon the Medical Society of the State of New York until ratified by the House of Delegates or by a two-thirds vote of the Council sitting ad interim' It, therefore must be understood that whatsoever may take place within conferences is strictly of a deliberative character, and for ratification it must be passed upon by the House of Delegates of the State Medical Society, or by two-thirds vote of the Council

"Pursuant thereto, the Public Relations Committee of the Medical Society of the State of New York thanks your Committee on the Care of Crippled Children for the privilege of advising with it concerning the questions now under consideration, and draws attention to the following principles governing the practice of medicine as enunciated by vote of the Medical Society of the State of New York

"First That it recognizes the principle that the State should adequately recompense physicians for the professional care of the *indigent* poor of the State,

"Second That it is the duty of the State to determine who are permitted to avail themselves of this State aid, and not place upon the individual physician the economic burden of attending those who are financially able to pay, but who seek State Aid to the relief of their financial responsibility,

"Third That it is recognized that economic principles enter into the practice of medicine on the part of the individual physician, and that whatever may be advised in expenditures of money on the part of the State in the questions under consideration, can only so be done on a minimum basis,

"Fourth It is a recognized principle that no two cases of sickness or injury are exactly alike Therefore, whatsoever may be advised can only be for the immediate remedying of a condition Future attendance must be based upon the time and effort expended by the physician, and the responsibility of the physician does not cease until the case is discharged by him

"Fifth That through its proper committees, the Medical Society of the State of New York will be glad to advise with various committees of the State government in public welfare work designated for the care of the physically handicapped child, as to those who are considered competent to do such work who may be solicited in the helping out of the State in its program of betterment"

The meeting of the Committee on Public Relations was continued during a luncheon in the University Club

The afternoon session At two o'clock the Committee on Public Relations, together with Drs Trick, Vander Veer, and Lawrence met in the office of the State Department of Health in conference with the representatives of the State Board of Charities, and of the State Departments of Education and of Health for the purpose of discussing uniform fees for performing operations paid for by funds from the County and State

Commissioner Nicoll said that there was no reason why physicians should do operations free, and that most of the cases under discussion were located in parts of the State not having free hospital service He stated that the order of the Judge was binding in the Board of Supervisors in the payment of fees of doctors and

It has been found in the work through the County that the condition of the children's teeth, not only in the pre-school group but also in the school, although somewhat improved than in former years, is still a serious situation handicapped by lack of facilities for correction It is recommended that the Society take the matter up with the local Dental Society and see if some plan cannot be worked out by which certain clinics might be given to the country children A few individual dentists help out occasionally, but a County-wide plan of cooperation would help materially

It is recommended that the Educational Campaign of Early Diagnosis against Tuberculosis be continued Also that the chest examination clinics be held again this year in more of the towns and, if possible, regularly every three or four months in certain districts of the County so that active cases may have regular medical supervision and all contacts be examined

It is recommended that the Society discuss, particularly this year, the increasing emphasis being placed on tuberculosis in children, and work out some plan in the near future for intensive examination including X-rays of high school groups because it is in this group that the mortality rate of tuberculosis has not declined

We recommend, further, that the pre-natal clinics be continued and increased in number, but this must have the continued backing not only of the Society as a whole but each physician individually in order that progress may be made to bring pre-natal care to every mother in the County This can be done if each physician would take particular pains to explain pre-natal service, including the nursing care, to each patient and refer his cases for nursing care as well as medical supervision

It is recommended, also, that the Society approve a survey of the crippled children in the County A little over a year ago, a "Tiny Tim Club" was organized in Poughkeepsie and has done considerable good work in bringing about corrections of deformities resulting from paralysis, etc, to some of the children But a complete survey of the situation of this County at this time is pertinent in view of the message of Governor Franklin D Roosevelt to the Legislature, a quotation of which is hereby given.

"While we have made and are making splendid progress in caring for the general health of our citizens, there are two specific matters in which we can lay the foundations for great public benefit

"The first of these is the care of adults and children who, through accident or disease, are so crippled in body that they are unable to lead useful and happy lives It is estimated that at least 50,000 men, women and children in the State of New York are thus seriously handicapped, and many of them require constant attendance on the part of some able bodied person As a matter of good business, it would pay the state to help in restoring these cripples to useful citizenship, and the great majority of them can, with the aid of modern medical science, be so restored Most of them are, however, not today receiving adequate care or treatment for the very good reason that such treatment costs more time and money than the average family can afford

"But there is an added reason I conceive it to be the duty of the state to give the same care to removing the physical handicaps of its citizens as it now gives to their mental development Universal education of the mind is, after all, a modern conception We have reached the time now when we must recognize the same obligation of the state to restore to useful activity those children and adults who have the misfortune to be crippled"

At this time, it is the desire of your Committee to extend to the Dutchess County Health Association and other agencies, and especially to Miss Dorothy Carter, the Executive Secretary of the Association, the heartfelt thanks of the Committee for her warm and fervent cooperation during the past year We feel that without her assistance, this Committee would have failed in its efforts to promote the public health of the community Your Committee could not do better in offering this report than to quote from the Editorial Page of the STATE JOURNAL of September 1st, 1928

"The great obstacle in the way of practice of public health and civic medicine by physicians is that the practice of these specialties requires self-secrifice with little direct returns in money or honor While the future may develop a people who will pay for advice in preventive medicine, the fact remains that at present most persons expect to obtain that advice free and to follow it only in the presence of immediate danger It is greatly to the honor of physicians that they are rapidly expanding the sphere of their public health work from a conscientious sense of duty rather than from any hope of obtaining financial reward

"The first essential in the performance of public health work by a county society is a survey of the field Nearly every county society in New York already has a committee on public health, and many societies have expanded its duties to include the relations of the medical society to lay health organizations This committee needs to know which health organizations are active in the county, the names of their officers and the work that they are trying to do The members of the committee also form an intimate acquaintance of the leaders in the lay health organizations, and ascertain their medical point of view Furthermore, the committee needs to instruct the lay leaders in the point of view of the medical profession, and inform them of the amount of public work which is already being done by family physi

Department at present is interested in these cases only to the extent of getting their name, age and disability, and of finding out if they were receiving treatment If any were not receiving treatment, the County Judge would issue an order for their care

Dr Wilson further said that this whole matter of crippled children is apparently stimulated into increased activity because of the interest of Governor Roosevelt in those physically handicapped He wondered if under these circumstances and the demands of the law, the medical profession would object He further added that, if the Department of Education had made any errors in dealing with the physicians, he apologized to the medical profession of New York State and would not knowingly make the mistakes again

The conference adjourned at four o'clock, with its participants feeling that a very great advance had been made in securing a unity of purpose and action among all those engaged in rendering medical service on a community basis

PUBLIC RELATIONS COUNTY SURVEY, No 2—DUTCHESS-PUTNAM

The Committee on Public Health and Public Relations begs leave to offer the following report of its activities for the past year

An effort was made at the beginning of the year to put into effect the five functions set forth by the State Committee on Public Relations, and this has been accomplished with very little effort on the part of the Committee as every health agency in Dutchess County has been very willing to cooperate with the Committee The Committee feels that the year just past has not been devoid of results, and although it is the first year that anything has been attempted and the Committee had no precedent to follow, it feels that at the close of the year the Society can be assured that the future will bring about the results expected by the State Society A brief summary of the activities during the year are given at this time

The Committee took an active interest in the Toxin-Antitoxin Campaign against Diptheria in the City of Poughkeepsie in May 1928, and was instrumental, in part at least, in securing from the Common Council an appropriation of $2,000 00 to pay the expenses of this campaign, which included an honorarium of $50 00 to each doctor that participated Through the efforts of the Committee, the Board of Supervisors appropriated the sum of $500 00 so that the doctors practicing in the various Clinics throughout the County could be somewhat reimbursed for their time spent, and the assurance is given that more may be obtained this year

Diphtheria Toxin-Antitoxin Clinics were held also throughout the County during the past year and over 2,500 children have been immunized, bringing a total for the County up to about 12,000

Twelve infant and pre-school clinics have been held outside of the Cities of Beacon, Rhinebeck and Poughkeepsie which have regular monthly or weekly clinics

An "Early Diagnosis Campaign against Tuberculosis" has been conducted through the entire year with general meetings in Early Diagnosis held at Poughkeepsie, Rhinebeck, Hyde Park and Hopewell Junction which have been addressed by experts outside of the members of the County Society Regular weekly and monthly clinics are held in Poughkeepsie and Beacon, and six clinics have been held in various towns throughout the County

At the request of this Committee, the Dutchess County Health Association secured the service of an extra nurse to care for pre-natal work and two monthly clinics have already been started in the County

This is in brief a summary of the activities that your Committee has been interested in, and all of these activities have been directed by this Committee on Public Health and Public Relations

Your Committee would make the following recommendation Continued drive against Diphtheria, especially with the pre-school children, as out of the approximate 12,000 children so immunized only about one-fifth were under five years of age We would especially recommend that intensive drives be held in those towns which did not have any in 1928 and that the other towns continue this year in order to get the stragglers and new babies

It is recommended that the infant and pre-school clinics be held frequently so that the mothers may bring their babies regularly to be weighed and for examination, and there is no reason why clinics should not be held at least once a month in some of the larger towns such as Red Hook, Pine Plains, Hyde Park, Rhinebeck, Amenia, and Dover, and in the smaller places twice a year, if possible spring and fall

We feel that the plan used last year of having the local physician or health officer conduct the clinics in his territory worked very well, and we suggest that the same plan be used this year, or that the physicians exchange with each other

We would call the attention of the Society to the fact that next to defective tonsils the largest number of defects were found to be in the poor health habit and faulty nutrition class which, taken all together, amount to about 33-1/3% of all defects The need of intensive educational campaign regarding the importance of nutrition in pre-natal, infant and pre-school periods is also recommended Over 10% of the defects are dental and they are important in so young a group

MEDICAL WARES

LANTERN SLIDES

Every doctor is interested in lantern slides If he does not use them himself, he looks at them in nearly every medical society meeting

They consist of photographs, drawings, diagrams and tables and even of actual specimens which can be laid flat on a glass slide One can write or draw upon a glass slide and show it upon the screen immediately The medical lecturer needs lantern slides as much as he needs a blackboard A common fault with lantern slides is that their individual details are too small This is especially true of tables Statistics are dry reading, and their exhibition on a lantern slide is a visual aid to the voice of the lecturer However, that aid becomes a hindrance when the figures and letters are too small to be read easily All the conscious effort devoted to spelling out a slide is a detraction from the thought conveyed by the table

A test of the legibility of the figures and letters on a lantern slide is that of reading them as one would read an ordinary book, for an observer will see the projection picture about as he sees the slide held at the distance of ordinary reading This may be demonstrated arithmetically

The visible part of an ordinary lantern slide measures 3 by 2 inches Suppose it is held 1.25 feet from the eye and is easily read at that distance Suppose further it is thrown upon a screen twenty times as far away or twenty-five feet. If the picture on the screen is twenty times as large, or is 60 by 40 inches, the image of the letters and figures formed on the retina will be exactly the same size as before, while to observers sitting fifty feet from the screen, they will be only half that size, and practically illegible

The inexperienced lecturer takes a table or diagram covering a page 4 by 6 inches, and photographs it on a slide reducing it to half its original size He then throws it upon a screen, and from his position as speaker he can read it easily, but to those forty feet away, it appears as the smallest possible type looks when read at arm's length

A good working rule in making a lantern slide is that the letters and figures on it shall appear of the size of ordinary type. An application of this rule will put a drastic limit to the amount of reading matter which can be printed on a slide. The letters of an ordinary typewriter are of a standard size to be easily legible on a screen, half that size is the lowest limit of easy legibility

It is not always possible to compress a table to the size of a lantern slide and preserve its legibility, but doctors who lecture will promote that ideal if they will give the slide makers instructions regarding the size of the type to use

Another point that is usually neglected is that regarding glare from the screen The letters of the captions shown at moving picture theatres always consist of a bright light on a black background—the reverse of black letters on a white background Letters of light cover less than a quarter of the surface of a slide or page of text, and a diagram covers a proportion still smaller When black lines appear in a lighted field, there is a glare and a diffusion of the light over the letters Both of these undesirable conditions are largely eliminated when the lines are drawn in light upon a black field

Letters in lower case form are more legible than those printed in capitals, because readers are accustomed to lower case type A book or newspaper is not printed in capitals, but in lower case Movie houses use lower case type for their captions, and so should a medical lecturer who desires to secure legibility

The making of lantern slides is something of a mystery to the average doctor, and he looks at a developing picture with wonder when he sees a slide made for the first time. The very name "Lantern" slides is a hold-over from the days when they were "slid" into a magic lantern for showing them on the wall Transparences is a more scientific name for the slides As a matter of fact, a slide is only a photograph printed on glass instead of paper A doctor can make his own slides as easily as he can print his snapshots on velox paper

Lantern slides are made rather by direct contact with a negative as a paper print is made or by photographing a negative with a camera. A camera has the advantage of permitting enlargements or reductions to be made One can make a lantern slide from a paper print by making a negative and then printing the slide from it

After a slide is printed and dried, it is mounted beneath a paper mat in such a way that only the part to be shown may be seen The use of a mat simplifies the process of making a lantern slide, for an undesirable part need not be omitted, but only covered

cians When physicians and lay leaders have each acquired the other's point of view, the way is open for physicians to advise the laymen, and ultimately to assume the direction of all public health activities in the county"

Your Committee attacked this problem of public health and public relations with fear and trembling insofar as it felt that it was a well-nigh impossible task, but as the year has seen the cooperation given, we quote from the article of Linsly R Williams, M D, in the STATE JOURNAL of April 15th, 1928,

"The problem then consists of how society can continue to increase the practice of curative medicine and to improve its quality, and second, how society can provide for the care of those individuals who need both preventive and curative medicine but do not now receive it because they are either indigent or unwilling to pay the price perhaps justly demanded by physicians The answer to this second question demands the thought and action of all medical bodies, and if organized medicine does not point the way to a solution of these problems, the much feared State Medicine may become a reality, in the establishment of compulsory health insurance for the larger part of our industrial population"

Concluding its report, the Committee feels that the question of Public Relations in this County has been definitely established and commends to your consideration a quotation from the address of Dr James E Sadlier, then President of the Medical Society of the State of New York, given at the meeting of the Second District Branch, in December, 1927.

"The practice of medicine is changing, and no doctor can now afford to limit his practice to the cure of established diseases—he must be active in seeking to prevent sickness and disease Physiological processes pass insidiously into the pathological and health fades into sickness just as the green leaves change into the livid hues of autumn It is the function of the physician to note the change from the normal to the pathological—to guard the people against designing alarmists, and yet promote all measures for detecting approaching sickness and warding off disease"

JOHN, A CARD, *Chairman*

THREE GENERATIONS OF PHYSICIANS IN THE ROSSMAN FAMILY

My grandfather, John I Rossman, of Columbia County, N Y, reared a family of fourteen children—eight sons and six daughters Four of the sons were educated as physicians Two of them, Walter and Washington, who were twins, were born in the year 1814 After due preparation, they moved to Mississippi and practiced medicine till some time during the Civil War

Their brother, John Rossman, located in Albany and practiced many years His son, Walter B Rossman, graduated at the Albany Medical College in 1892, and is in practice in Albany, N Y

My father, Peter P Rossman, was born in 1801, graduated at the Berkshire Medical Department of Williams College, Mass, in 1825, and practiced medicine until about 1850 His son George W Rossman, myself, was born in 1841, graduated at Hamilton College as an A.B in 1863, and at the Albany Medical College in 1866, retired from active practice in 1916, but yet retains his membership in the Columbia County Medical Society My son, Dr Clark Green Rossman was born in 1871, graduated at Cornell University in 1893 as a Civil Engineer, and at the College of Physicians and Surgeons in 1896 He has since been engaged in the practice of Medicine at Hudson, N Y

GEORGE W ROSSMAN

THE STIMULATION OF FATIGUE

The *New York Times* of December 28 has a sensible editorial entitled "The shame of being tired" in which it says

"If all the fathers and mothers who worked hard to make Christmas merry for their children now confess that they are worn out, they will receive sympathy and praise from their friends To be tired in a good cause usually is commended But a psychologist, Mr H M Johnson, who has had charge of searching investigations of fatigue at the Mellon Institute of Industrial Research of the University of Pittsburgh, sharply challenges the idea that to work till one is tired is praiseworthy In *Harper's* for January he compares fatigue, both in its causes and results, with intoxication and with asphyxiation It may be as dangerous as the latter and as reprehensible as the former

"If one drink sets a man up and makes him feel better, so does a little work As fatigue increases, the field of attention decreases, but that attention directed at a single object or purpose is intensified Eventually it becomes difficult to divert the tired individual Every one must have noticed that this is true of tired children and of intoxicated persons The latter may no longer derive pleasure from drinking, but they resent any hint that they desist An overtired child almost always refuses to be put to bed

"Mr Johnson points out numerous other resemblances between drunkenness and fatigue Stammering, seeing double, irritability and reversion to childish tendencies are some of them If what he says is true, we must feel ashamed when we are tired, and creep away to repair the damage as inconspicuously as possible"

SUPERANNUATED INFANTS

Scientists know that thyroid extract fed to tadpoles causes them to run through the stages of development with increased rapidity so that the tadpole quickly becomes a fully formed frog, but a dwarf in size The effect is to make the animal prematuredly aged An excess of thyroid may be the explanation of the phenomenon described in the following editorial from the *New York Herald Tribune* of December 3

"The name of a once world-wide celebrity of the screen, mentioned in a London lawsuit, is a reminder that in some instances thirteen years can be a ripe old age and eighteen can constitute a 'lean and slippered pantaloon' Perhaps the 'movie' star of eight does not feel that each birthday is a tragedy, but certainly his managers and often his parents do Too often he develops into just an ordinary grown-up whose fate must be to hang about the 'lot' for a chance to be taken on as an extra In Shakespeare's definition, old age was 'sans everything' But too often in the motion picture world a child star who has passed his thirteenth birthday has become superannuated"

RADIUM POISONING

The newspapers last summer carried news of deaths of workmen who applied luminous paint to the faces of watches The cause of the deaths was poisoning with radium in small doses, frequently repeated The paint consisted of sulphide of zinc mixed with traces of radium whose emanation causes the oxide to glow faintly Those who were most seriously affected had been in the habit of touching the paint brushes to their lips in order to moisten them

The *New York Herald Tribune* of December 21 has an account of a conference called by Dr Hugh Cumming, Surgeon General of the U S Public Health Service, after Dr Ethelbert Steward's Commissioner of Labor Statistics had urged that the use of radium paint be discontinued The confrères seemed to agree that most of the deaths had been among those who moistened their brushes with their lips, but others contended that any use of radium was a health hazard The article says

"Dr A B Moore, dean of science at Purdue University, contended that "if we shut down all the industries involving a health hazard we should shut down every metal mine in the country" He argued, moreover, that there was doubt as to the real cause of some deaths attributed to commercial uses of radium in former years, when less was known of radium

"P E Stringer, of Elgin, Ill, director of manufacturing for the Elgin National Watch Company, told the conference his company would be "happy" to discontinue the manufacture of radium dial watches if it were protected from competition of imported watches with luminous dials"

The *New York Herald Tribune* of December 25 says editorially

"It would be a mistake to end a useful industry in an excess of alarm over supposed hazards which at best are doubtful, and at worst avoidable"

THE DAILY PRESS

DURABILITY OF DOLLAR BILLS

Physicians generally will agree with what James J Montague says about the durability of paper money Writing on December 21 in the department of "More Truth Than Poetry," which is a daily feature of the *New York Herald Tribune,* the versifier says

I'm told that fifty-dollar bills
Are brittle when they're new
And should be laid away in tills
A year, or maybe two—
That when this trifling time has passed,
Their fibers will grow strong,
And one will find that they will last
A hundredfold as long

This statement may be true or false,
But I shall never know,
For I have neither tills nor vaults
In which my bills to stow
And be they frail or be they strong,
All those I ever see,
Assuredly will last as long
As they abide with me

Though old and worn or crisp and new,
With backs of gold or green,
They tarry briefly in my view,
Then vanish from the scene
They have to go for this or that,
Bright butterflies are they
Which touch my hand to leave me flat
And flutter on their way

And if they crack or tear across
As on their flight they fare,
Some other man must stand the loss
And little do I care
So let them brittle be, or tough,
The few I ever see
Will certainly last long enough
To take away from me!

THE PULMOTOR CONDEMNED

The *New York Times* of December 10 contains an article on the discontinuance of the pulmotor, and in its place the use of an inhalator which supplies a mixture of 95 per cent oxygen and 5 per cent carbon dioxide The *Times* said

"The pulmotor was simply a pump which forced pure oxygen into and out of the lungs of a patient suffering from partial asphyxiation It was disapproved on the ground that this artificial application of pressure within the lungs was likely to damage the air passages and cells, while it was discovered that the normal effect of the pure oxygen was to depress natural breathing Scientific study showed that the lungs were naturally stimulated by a certain amount of CO^2, or carbon dioxide This is because the automatic breathing of each individual depends upon the presence of carbon dioxide in the lungs

"In ordinary air there is only about 20 per cent oxygen Five per cent of carbon dioxide will cause heavy breathing It was discovered, however, that if the 5 per cent carbon dioxide is mixed with 95 per cent oxygen, the lungs will be stimulated to breathe deeply, and so will take in a great deal more than the normal supply of oxygen

"It is further explained that the inhalators now in use are merely containers for this mixture with the necessary valves and tubes for supplying it to the patient When it is found that the carbon dioxide is not sufficient in itself to start the lungs working, artificial respiration is resorted to as an aid to the natural process

"The Brooklyn Edison Company now has ten inhalators which have been used prominently in twenty-nine emergency calls since the latter part of June, according to the company's announcement The company has already instructed more than 100 employes in the use of the instrument and others are continually being trained"

The pulmotor has been advertised in the past so widely, and spectacular accounts of its use have appeared in the newspapers so frequently that even doctors are not always familiar with its danger or the advantages of the prone-pressure method of artificial despiration It is fortunate that the method of doing artificial respiration is now a part of the standard instruction given to Boy Scouts, and to all employees of gas and electric companies

THE NATURE OF DISEASE. By J E R McDONAGH, F.R.C.S. Part II. Octavo of 434 pages. London, William Heinemann, Ltd., 1927. Cloth, 21 shillings.

This is the second of two volumes in which the author expounds his theory of the nature of disease and its rational treatment. His theory may be summarized as follows. The proteins of the blood and tissues are in the form of colloid particles. In their finely divided state they possess a vast surface area which has great surface energy. This energy is electronic. He reduces all pathological processes to a few fundamental changes in the colloid and electronic state of the proteins of the body. Normally, they show a certain state of dispersion and are negatively charged. Bacteria, toxins and all other disease producing agents rob the proteins of electrons, this leads to changes in the colloid state, either true solution, condensation, dehydration, hydration or coagulation. All symptoms and pathological findings are explainable on the basis of these changes. The object of treatment is to restore lost electrons and so cause the changed proteins to revert to their normal state. Drugs act by virtue of their electric charge. The author is intimately acquainted with chemistry, his theory is based upon physico-chemical studies of the blood and upon treatment of many cases according to his theory.

In the first 200 pages, the author discusses the way in which the various constituents of the blood and tissues, water, salts, carbohydrates, fat and amino compounds, are affected by changes in the protein particles. He then discusses the effects of such changes upon the vascular system and the important viscera. There are many brief case reports and some animal experiments to illustrate his statements. One chapter each are devoted to the mechanism of cancer and of the toxemias of pregnancy. Then comes a chapter on chemo-therapy. The author reveals an unusual chemical knowledge and seeks to show that drugs act through their electrons. The average reader will find this chapter considerably over his head. The initiated will find it full of fascinating ideas.

One is impressed by the author's remarkable knowledge and great industry. He has applied the electronic theory of matter to pathology and therapeutics, building up a working hypothesis which seems logical, contains many interesting observations and provides much food for thought. If this theory is correct, its importance to medicine can hardly be exaggerated, for it goes beyond Virchow's cellular theory of pathology to the reactions of the molecules and electrons which compose the cell and provides a scientific basis for therapeutics by explaining the mechanism of drug action. It would, indeed, introduce a new era in medicine. The reviewer lacks the knowledge to pass judgment. However, this contribution should be read, discussed and subjected to experiment by those scientifically equipped.

E. B. SMITH.

TOBACCO AND PHYSICAL EFFICIENCY. A Digest of Clinical Data [with annotated bibliography]. Preface by HENRI VAQUEZ, M.D. Published under the Auspices of the Committee to Study the Tobacco Problem, with a foreword by Alexander Lambert, M.D. Octavo of 134 pages. New York, Paul B. Hoeber, Inc., 1927. Price, $1.85.

This is a small but valuable reference book, for therein are given succinctly the known facts regarding the influence of tobacco on the body, and free discussions of matters still *sub judice*. Published under the auspices of the Committee to Study the Tobacco Problem, and with a foreword by Alexander Lambert, the book carries an unusual authority.

Schrumpf-Pierron has reviewed the foreign literature, and Eugene L. Fisk has added notes of the American studies. The foreign editor is a talented clinician, now professor in the University of Cairo.

There are chapters on the chemistry of tobacco, its pharmacologic action and, more interesting, studies of the action of tobacco on the nervous, circulatory, respiratory, digestive and genito-urinary systems. Then follow chapters on further phases of tobacco action.

All this information is given within the compass of 55 pages. The bibliography of 7 pages is annotated. The reviewer freely commends the book to the attention of all clinicians.

FRANK BETHEL CROSS.

TRAITÉ D'ÉLECTROCARDIOGRAPHIE CLINIQUE. By PAUL VEIL and JUAN CODINA-ALTÈS. Octavo of 447 pages, illustrated. Paris, Gaston Doin et Cie, 1928. Paper, 95 francs.

This work is of great value not only because it is a scholarly presentation of the subject of electrocardiography, but because it brings to American readers the French point of view concerning many of the unsolved problems in this field. The authors are not narrow in their view-point, however, and show unusual familiarity with the best work in this country and in England.

The chapter on the origin of the electric current registered on the electrocardiogram contains a careful discussion of all the accepted theories of physiologists upon this point.

When the authors take up the various abnormalities of the electrocardiogram, they systematically define the disturbance, then discuss the experimental and pathological data available and then proceed to the clinical and electrocardiographic studies. This plan gives one the feeling of careful, dependable work.

The chapter on nodal rhythm is especially noteworthy as it clearly defines this condition following the interpretation of Gallavardin. In pure nodal rhythm, the P waves must be frankly negative, the heart rate slow, between 40 and 55, and slightly irregular. Clinically, one rarely sees pure nodal rhythm.

The authors do not agree with the work of Oppenheimer and Rothschild in describing an entity, arborization block. They feel that the evidence so far adduced only warrants the localization of the lesion in the myocardium in general.

A very long and involved chapter is devoted to the subject of extrasystole, the length of the chapter being somewhat out of proportion to the importance of the arrhythmia studies. In the chapter on electrocardiography in the cardiopathies, the authors correlate the electrocardiogram with the diseases of the heart. In this they pay special tribute to the work of American authors and, in fact, draw a good part of their data from this source.

This book is a complete treatise upon the subject of electrocardiography and should be very valuable as an authoritative presentation of French opinion.

E. P. MAYNARD, JR.

BRAIN AND MIND OR THE NERVOUS SYSTEM OF MAN. By R. J. A. BERRY, M.D. Octavo of 608 pages, illustrated. New York, The Macmillan Company, 1928. Cloth, $8.00.

A neurological work of careful thoroughness, the principles of which have been applied in tests on some 15,000 individuals. Dr. Berry describes minutely the evolution, development, structure and function of the components of the human nervous system. Without venturing to dogmatically explain all human behavior mechanistically, he proves his basis—no neuron, no mind—and shows that intelligence depends on the number and nature of the neurons, and the number and nature of the incoming receptor impulses. Psychology is shown as a pseudoscience unless approached as a department of brain physiology and accompanied by a thorough knowledge of brain physiology, anatomy, histology, and pathology. This book is well bound, profusely illustrated, and has an extensive bibliography.

E.

BOOK REVIEWS

THE HEART IN MODERN PRACTICE. Diagnosis and Treatment. By WILLIAM DUNCAN REID, A.B., M.D. Second Edition, revised. Octavo of 466 pages, illustrated. Philadelphia and London, J. B. Lippincott Company, 1928. *Cloth, $6.00*

The second edition of this book presents many modifications, including the addition of nine new chapters. In its present form, it should take high rank among the many recent books on the heart.

It is not exhaustive in scope but the literature has been judiciously utilized, few important contributions being overlooked. Contraversial points are sketched in with fairness to each viewpoint. The book is very well balanced. The natural history of pathologic states is presented with the eye of a real clinician, and yet the graphic methods of study are treated in an interesting and competent manner. The illustrative tracing are unusually clean cut. If the author has any hobby it is the circus movement which, by the way, he describes with remarkable brevity and clearness. He is inclined to depend upon it as the explanation for more of the arrythmias than most authors, although he is quite open minded on the subject.

The book may be highly recommended as a text book covering the essentials of modern cardiology.

T. H.

THE SENSORY AND MOTOR DISORDERS OF THE HEART. Their Nature and Treatment. By ALEXANDER BLACKHALL-MORISON, M.D. Second Edition. Octavo of 362 pages, illustrated. New York, William Wood and Company, 1928. Cloth, $6.00

Sir John Rose Bradford contributes a graceful foreword to this posthumous edition of his friend, Dr. Blackhall-Morison's last work, "The Sensory and Motor Disorders of the Heart," paying tribute to his friend's enthusiasm and industry. The book will be of interest to the cardiologist chiefly in its emphasis on the importance of the nervous mechanism of the heart, as opposed to the heart muscle. It may be that certain currently accepted conclusions should be rechecked, even though the author of this challenge seems to be unfamiliar with the grounds upon which they rest.

T. H.

RECENT ADVANCES IN CHEMISTRY IN RELATION TO MEDICAL PRACTICE. By W. McKIM MARRIOTT, B.S., M.D. Octavo of 141 pages, illustrated. St. Louis, C. V. Mosby Company, 1928. Cloth, $2.50

A very simple and lucid description of the application of modern chemical science progress to medicine. Marriott has undertaken to explain the pathogenesis and therapeutics of cardio-renal and metabolic diseases on a chemical basis. There is much of practical value to the physician. His discussion of acidosis and alkalosis, blood chemistry, and metabolism is clear and readable. He calls attention to fundamental chemical principles employed in the treatment of alkalosis, acidosis, nephritis, diabetes, obesity and the vitamine-deficient diseases. The book is highly recommended.

WILLIAM S. COLLENS

DIABETIC MANUAL FOR PATIENTS. By HENRY J. JOHN, M.A., M.D. 12mo of 202 pages, illustrated. St. Louis, C. V. Mosby Company, 1928. Cloth, $2.00

Another addition to the large number of manuals for diabetic patients. It happens to be a good one. It is written in simple, non-technical language, is fairly well illustrated, and has a large selection of diabetic recipes.

WILLIAM S. COLLENS

A PRACTICAL MEDICAL DICTIONARY. By THOMAS LATHROP STEDMAN, A.M., M.D. Tenth revised Edition. Octavo of 1194 pages, illustrated. New York, William Wood and Company, 1928. Flexible leather, $7.50

The tenth revised edition of Stedman's Medical Dictionary includes about five hundred new medical terms and changes have been made in about the same number of old ones. In order not to enlarge the volume, the editor has omitted the trade names of discontinued pharmaceutical preparations and the entire list of mineral springs.

By its constant revision, it continues to hold its place among our standard dictionaries of medicine.

FREDERIC DAMRAU

NURSES, PATIENTS, AND POCKETBOOKS. Report of a Study of the Economics of Nursing Conducted by the Committee on the Grading of Nursing Schools. MAY AYRES BURGESS, Director. Octavo of 618 pages. New York City (Committee on the Grading of Nursing Schools), 1928. Cloth, $2.00

The economic factors affecting nursing education are dealt with in this report, which purports to tell, largely on the basis of a study of questionnaires, all about the nursing situation. Therefore the report should prove interesting to doctors as well as nurses. Subjects covered include the development of nursing, unemployment, the personality, ambitions and psychology of nurses, how nursing service is distributed, matters pertaining to hospital nursing and rural nursing, and all sorts of testimony throwing light upon nursing problems.

A. C. J.

METHODS AND PROBLEMS OF MEDICAL EDUCATION (Ninth Series.) Quarto of 386 pages, illustrated. New York, Division of Medical Education, The Rockefeller Foundation, 1928.

The Ninth Series of the Rockefeller brochures on Medical Education is devoted to legal and forensic medicine, Institutes of Legal Medicine in Austria, Hungary, Canada, Cuba, Czechoslovakia, Egypt, Germany, Italy, Poland, Portugal, Roumania, Scotland, Sweden, Denmark and France are described. An excellent article by Dr. Charles Norris of New York on the Responsibility of the Chief Medical Examiner is included. As usual the book is profusely illustrated.

C. A. G.

THE ANATOMY OF THE NERVOUS SYSTEM. *From the Standpoint of Development and System.* By STEPHEN WALTER RANSON, M.D. 3rd Edition, revised. Octavo of 425 pages, with 284 illustrations. *Philadelphia and London, W. B. Saunders Company, 1927.* Cloth, $6.50

Since the publication of the first edition in 1920, this book has become a recognized text in many of the leading medical schools in this country. This type of a book has long been needed and desired by both physicians and medical schools. There have been several changes in the third edition, as well as a few additions. It has been the desire of the author to keep this book small and to avoid having details obscure the more important points. The purpose of the third edition is to bring the book completely up to date and to correct certain inaccurate and misleading statements.

O. C. P.

DRYCO

"COW'S MILK AT ITS BEST"

AN unrivalled record of results over a period of many years, has definitely established the fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases.

It is significant that this milk has long maintained steadily increasing prestige with the medical profession and is prescribed by leading pediatrists all over the world.

LET US SEND SAMPLES, SUGGESTED FEEDING TABLES AND CLINICAL DATA!

For convenience, pin this to your Rx. blank or letterhead and mail.

THE DRY MILK CO., 15 PARK ROW, NEW YORK, N Y.

OUR NEIGHBORS

THE KENTUCKY HOUSE OF DELEGATES

The proceedings of the House of Delegates of the Kentucky State Medical Association, held September 10-13, 1928, are printed in the December issue of the Kentucky Medical Journal, filling forty pages The following extracts will be of interest to New York physicians —Editor's Note

Trachoma Hospital "This institution was given to the Kentucky State Medical Association by the granddaughter of Ephraim McDowell as a memorial to him It was loaned by the State Medical Association to the State Board of Health for a trachoma hospital which is being officered and conducted by the United States Public Health Service Dr Sory is the officer in charge"

"I want to call the attention of the ladies to the curtains in Dr Sory's office They are lace curtains that were brought from Paris many years before the Civil War When we took over the building, they looked like brown cobwebs Under the skillful manipulation of the nurses, they have been entirely restored These beautiful works of art are worthy of your attention and admiration

"It is one of the few institutions in the world where cases of trachoma are being received and diagnosed and operated and discharged cured, right along, day by day At one time in Kentucky we had, you will remember, between 50,000 and 60,000 cases of this disease We now have less than 3,000 cases We propose to get rid of all of them within the next few years That is one of the most monumental pieces of work that has been done.

"This disease has increased in every other geographic section of the world where it ever existed It is the major disease in Egypt, in Brazil, in China, in Armenia, and in many other sections where it has been studied and where science has been directed upon it, but in Kentucky it has been almost eradicated, in many of our counties entirely eradicated It will be harder to get the few remaining cases than it was to get cases in the beginning when there were so many, but we propose to continue the campaign until the disease is eradicated"

Malpractice defense The medico-legal committee reported as follows

"'Number of suits on hand, still pending 15
Number of suits threatened 4
Number of cases dismissed 16
Number of cases judgment obtained by plaintiff none this year
Number of cases compromised none this year
Verdicts given the doctor 1

"'Seven suits have been filed since January, 1928, leaving eight cases still pending that are listed among the old ones'"

The Journal The officers made a perfunctory report on the JOURNAL, but Dr V E Simpson of Louisville made the following criticisms of the JOURNAL

"If a paper is presented for publication, containing tables, those tables should appear in smaller type than the reading matter of the paper as a whole In the first place, it will make them stand out, in the second place, it will conserve space, it will emphasize the fact that they are tables, and it is the common custom in well edited journals for this sort of procedure to obtain That is not the custom in our Journal So far is it from our custom that if one presents a paper to the publisher and wants reprints with tables in smaller type so as to present a better appearance, he has to pay for that exception That should not be the case The printers have small type, they put other material in small type, and there is no reason in the world why they should not put tables and matter of that sort in small type"

"I also want to say, in connection with the number of pages that we have devoted to scientific matter, that I am persuaded that the greatest help which this Journal is to the profession as a whole comes through its scientific material That should be made the first consideration. I think we devote too much space each year, particularly following the legislative session, to telling what is to be done and what has been done in Frankfort That could be very materially condensed Most of the profession is already acquainted with it We certainly get enough of it in the House of Delegates There is no necessity that I can see for devoting as many pages a year as are devoted in the recapitulation of the events, however interesting they may be to all of us, that takes place at Frankfort"

(One great difficulty with tables is that they are printed in a type too small to be read

Regarding medical news, the New York State Journal of Medicine seeks more news regarding the activities of the Committee on Legislation and the other committees of the State Society—Editor's Note)

Eight pages were devoted to the report of the Committee on Medical Education, of which Dr W A Jenkins of Louisville is Chairman Regarding the education of the people the report said

"The most telling and effective part of the

(*Continued from page 180*)

work must be done by the individual doctor in his individual community, man to man, if you please We should also employ freely popular talks, addresses and public health work in general We should elect full-time county health officers wherever possible The work of an efficient county health officer is of boundless importance to the community as a whole Every county in our state should have a county health officer, either full or part-time, according to the needs of the case. The Kentucky State Medical Association should have this as its goal"

Concerning the education of medical students, the report says

"Second, concerning the education of the doctors, in certain quarters we doctors have been flatly denied the right or the privilege of a directing hand in the education of medical students Our capacity to do this work intelligently has even been questioned However, all of this is now being changed rapidly The crying need of the times is for good general practitioners The medical profession is trending too much toward specialization Some adequate constructive plan must be worked out whereby we can supply our rural communities with good general practitioners Who shall take the lead in this work? The organized profession, of course, the doctors themselves Good roads, the automobile, county health centers, county hospitals, county health officers, public health work, the State Board of Health, etc, will all do a great deal The work should be continued The Kentucky State Medical Association should make an intensive study of this matter by the appointment of a special permanent committee, and said committee shall act with similar bodies all over the country"

The report has the following suggestions regarding post graduate education

"Summer Post Graduate Course The Kentucky State Medical Association should establish a summer post graduate course as a permanent feature The session should last two weeks, and it should be held in Louisville at a definite, fixed time It should be conducted by the State Board of Health and the Medical School of the University of Louisville jointly Both of these institutions in a certain sense are the children of the doctors of Kentucky The City Hospital and the other hospitals of Louisville would furnish an abundance of clinical material of every type It is very desirable for every doctor who practices any branch of medicine to get away from home at least once every year or two and see some new work In fact, this is the only way for a doctor who practices in an isolated locality to keep up on all of the new points, to keep in fact fully abreast of the times"

(*Continued on page 184—adv xvi*)

(Continued from page 184—adv xvi)

scientist or some man who is a Ph D and has never practiced medicine."

Dr Wathen said

"Our school is nearly half full now with all time or, better still, part time professors, as they call themselves, and they are drawing large salaries They are stressing the importance of laboratory work Laboratory work constitutes about two-thirds of it They will teach them how to make metabolic tests, how to run the electrocardiograph, all sorts of blood urea, blood chemistry, blood sugar tests, things that the average general practitioner can't do, never will do, and should not be expected to do He should be expected to send those to laboratories, that is a special line Why should we waste so much valuable time there and neglect physical diagnosis and the like, which we can teach at the bedside?

"What we wish to do is to change, if possible, our method, our curriculum, at the University of Louisville in such a way as to have more clinical teaching, make more of a practical surgeon or doctor and have not quite so much laboratory work, and have the work taught by men who have experience."

In regard to locating in rural districts, Dr Holbrook said

"One of the worst things for a young man who is thinking about place to locate is that you scare him to death of the country When I was thinking of going out to Shepherdsville I went around and asked some of my friends in Louisville, and not one advised me to go, not one thought I could make a living If you will encourage these younger men and find a location for them, there are many of them who would like it

"I have talked to many of my friends who are graduating and are interns and they say, 'Do you know of any place in Kentucky where I might get a location?' They are all wanting some place to go, and they hear the doctors saying they can't get the men to the country

"One of the chief things is that you scare the young doctor to death of the country talking about it

"Any young man who will go to a small community, a little town of 500 population or a little larger, and will really do the work that we are taught to do and are able to do, can make a living, if he doesn't do anything but take out tonsils"

Continuing the subject, Secretary McCormack said

"At the present time there are more than 1 000 vacant practices in Kentucky that will pay a man from $4,000 to $10,000 a year, far more than the average physician in Lexington and Newport and Covington is making I don't think there is a doubt about that

(Continued on page 187—adv xix)

The Chemist and the Fisherman Get Together

In Massachusetts the codfish is a state emblem symbolic of the great fishing industry It was logical, therefore, that the Patch laboratory located in Massachusetts, should be a leader in research on American cod liver oil

As a result of this research and the co operation of fishermen who furnish the fresh cod livers there was developed that pioneer American product—Patch s Flavored Cod Liver Oil

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch s Flavored Cod Liver Oil with its high Vitamin A content, is particularly valuable.

The guarantee of vitamin potency both A and D appears on every bottle. Another great feature—the taste—is a triumph over the oils of former days

Have you tasted Patch s Flavored Cod Liver Oil yet? You should You will be surprised at the pleasant taste —and the clinical results are all that can be desired

This coupon brings you the whole story and a sample bottle of

(*Continued from page* 182—*adv* xiv)

The report has the following suggestions regarding post graduate education

"This permanent post graduate course could be made the most remarkable and most effective thing for this society, if it were properly worked, that we ever had If the men will let us know what they want we can give it to them We don't have to give them an eloquent polysyllabic dissertation

"One man said, 'I should like to have some fellow get up and tell me the real lowdown on blood pressure'

"Another said, 'Yes, and then include the treatment, not what Professor So-and-so in Germany says, but what the best doctors in the world have finally agreed is the best plan to pursue and all that can be done in that condition'"

Discussing practical instruction in the art of medical practice, President Estill said

"All this super-scientific work which is being given at the present time does not at all make them better doctors, it makes them feel that they are too big to leave Louisville and go to the country, it makes them feel when they get through with a course of this kind that they can go back home and be worth something to their own people

"The object might come at once that we would lose our reciprocity with other states Personally, that is what we want We don't want to educate a lot of doctors to leave us, we want to educate men who will practice medicine in Kentucky"

Dr J W Kincaid said

"One of the arguments that was used for the consolidation of medical schools years ago was that a group of doctors would get together and establish a commercial school in order that the graduates thereof when they would get out in the country or get in practice for themselves would send the difficult cases to their professors I suppose that was all right, the professors were competent to take care of them, the young men were not I don't see any reason why that should not obtain It obtains even today We are asked to send our patients to the various clinics and large hospitals over the country Where is the difference?

"There should be clinical teaching, but it should be by men who are clinicians"

Dr Applehaus said

"The medical students and the people all look to the medical profession for doctors to teach the students This is simply a plea for representation, to have medicine taught by doctors, so that the students and the people on whom they are going to practice can have the benefit of the clinical experience that these men have had in practicing medicine and not from some laboratory

(*Continued on page* 185—*adv* xvii)

(*Continued from page 184—adv xvi*)

"There is plenty of financial opportunity for physicians to locate in the country Our system, though, has not been directed along that line I fully agree with Dr Smith that there not only should be no lowering of the standard of medical education, but that the standard of medical education should, and always should, increase."

The moral character of the medical students came up in the following remarks by the Secretary

"We have been confronted with another side of the situation Last year we suddenly had to get twenty-eight all-time health officers We naturally wanted so far as possible to get our own men in these positions The first three to seven men who came in to us had graduated from our own University of Louisville within two years, nice looking young fellows They had taken the State Board examination and passed creditably We sent them off for the post-graduate training school in public health, and received a letter in reply after six weeks of the post-graduate course that neither of these men had either the mental aptitude, the medical knowledge or the personal character that could make them health officers I don't know what is wrong about it, but something is wrong about an educational system that graduates three libertines and drunkards from a medical school and puts them out to practice medicine in a commonwealth I don't know where the error is It may be hyper-science, but it is surely lack of common sense and common honestly to be graduating men of that type"

At the end of the discussion the following resolution was passed

"'That the Kentucky State Medical Association has been considering the problem of medical education during the past several pears and views with apprehension the development of a system which is subordinating training in the practice of medicine to the purely scientific subjects of the pre-medical courses, that we urge the State Board of Health and the trustees and faculty of the University of Louisville to study this problem and that we urge that the Executive Committee of the Medical Department of the University of Louisville shall consist of physicians who have had at least five years experience in private practice of medicine, and that the dean of the school shall have had a similar experience'"

The House of Delegates next listened to the reports of the Councillor Districts and the county societies Reports were given from six of the eleven Councillar Districts and eight of the 104 county medical societies The report from Carlisle County was as follows

"We started out this year, and we have had eight members of our County Society, that includes two inactive physicians Every man in

The colloidal ability of KNOX SPARKLING GELATINE *is valuable in infant feeding*

Drs Alexander, Bogue, Downey and others have established the colloid-chemical power of gelatine. It has been proved that gelatinated milk is more readily digested and absorbed Many physicians and institutions have adopted it for certain specialized diets of infants. It increases the available nourishment of the milk mixture By reducing the formation of large curds, it helps overcome regurgitation and vomiting It is indicated where infants have colic or excessive gas formation, curdy stools, diarrhea or constipation

Knox Sparkling Gelatine is an important adjuvant in many special diets In diabetic cases, it imparts satiety to the patient's appetite, and adds valuable protein content to the menu. In the regimen of invalids and convalescents, Knox Sparkling Gelatine varies the monotony of the diet with dozens of dainty appetizing dishes Knox Sparkling Gelatine is a pure protein, unbleached, unflavored, unsweetened

QUALITY WITH ECONOMY

Knox Sparkling Gelatine is the highest quality for health It is a protein in its purest form, particularly suitable where carbohydrates and acids must be avoided When you purchase Knox Gelatine you not only get quality but economy, for each package makes four different desserts or salads of six generous servings each

Send for valuable booklets on dietetics

Leading dietitians have prepared the booklets listed below They contain much additional information on the medical value of Knox Sparkling Gelatine, together with tempting recipes for the various prescribed diets Surgeons, doctors, dietitians and members of hospital staffs will find them useful for reference Check those which interest you and mail us the coupon

What will your X-Ray equipment be like in 1939?

The following comments are typical of a large number received concerning the condition and operation of Snook X-Ray Machines purchased in 1917 and 1918, over ten years ago We quote from responses to our inquiries.

"Am perfectly satisfied and you can use my name whenever you wish.

"No piece of electrical equipment which I have ever purchased has given such real service with as little trouble"

"Machine in just as good working order as the day when installed."

"Do not believe that a new machine could be any better"

"Working satisfactorily every day in the year"

"Doing the finest work in the city"

The more you inquire into records of service, into high quality of work, into day-in and day-out, trouble free dependability, the more you will be convinced, we feel sure, that Victor offers you the greatest dollar-for-dollar value of any equipment you can buy

our county is a member of our County Society and we hold quarterly meetings During the past year every man has been present except two, every man has had his paper at the society meeting I think we have one of the best small county societies in the state Every man has paid his dues and every man has attended every meeting we have had except two men who were kept away from one of our meetings"

At the other extreme was the following report from Hopkins County

"I think we have the most active inactive society in the state We haven't had a meeting in so long I can't remember I don't think we have lost any membership, and we are paid up pretty well, but so far as meetings are concerned we don't have any"

The report of the Committee on Crippled Children covered two pages The care of those children is maintained under the state appropriation of $200,000, with the cooperation of the State Medical Association, and the Kentucky Society for Crippled Children, composed largely of civic clubs The report goes into considerable details, and shows an activity that is highly creditable to the physicians of Kentucky

BUILDING FUND FOR THE WEST VIRGINIA STATE MEDICAL ASSOCIATION

The following editorial from the January *West Virginia Medical Journal* describes a unique plan for establishing a building fund —*Editor's note*

The West Virginia State Medical Association has just learned that the McDowell County Medical Society has created a building fund to be presented to the state association when the latter organization is ready to purchase or erect a permanent state home in Charleston, W Va The treasurer of the McDowell society was directed to deposit the sum of $50 on savings account, and at the end of each calendar year beginning 1929, ten per cent of the net surplus of the society is to be deposited to the credit of this account The principal and the accrued interest thereon is to be applied to the purchase or erection of a building to be known as the Home of the West Virginia State Medical Association, the same to be located in the city of Charleston

Here is something new, and something highly commendable It is, so far as we know, the first definite and concrete step ever made in West Virginia for the sole purpose of creating a state home This admirable objective has been talked of for several years, and now comes the news of an actual fund set aside for no other purpose than the purchase or erection of a building The action of the McDowell society was purely voluntary We do not bring this matter to the attention of the association members with the idea of influencing other county societies to take similar action We simply wish to congratulate the West Virginia State Medical Association upon the thoughtful initiative of one of its component groups

FEE LISTS OF PHYSICIANS

The Massachusetts Commission on Necessaries of Life has received complaints that the Physicians of Lexington are forming combinations for fixing the prices for medical services While the Commission did not formally classify medical advice as a necessary "Commodity," yet it did start an investigation and aroused the ire of the editor of the New England Journal of Medicine The December 13 issue of that Journal quotes the Commission

"If the doctors in various municipalities are organizing for a purpose of controlling fees, the commission believes that the complete facts should be presented to the public It further believes that public opinion will prevent situations which might be a reflection on the medical profession generally"

The editor comments as follows

"In our opinion the commission has gone off at half-cock The chairman shows a lamentable ignorance of the fundamentals of medical practice when he implies that the establishment of a fee schedule is an attempt to hold up the public He should realize that whether or not such a schedule has been officially endorsed, there has always been a tendency among the physicians of a community to charge approximately the same fee for similar services The element of competitive bidding for practice by means of cutting prices has had no place in the economics of medicine, nor would it be desirable for this to be a factor in influencing the public in the choice of a physician Such competition would lead to consequences almost as bad as those of fee-splitting

"We can see no possible objection to the establishment by the local profession of a schedule of fees, such a schedule exists tacitly, anyway, and the adoption of a definite schedule simply means that representative medical men have discussed the matter and agreed upon a charge which seems to them just. Anyone who knows the type of man who is practicing medicine in Arlington, Lexington and Haverhill can believe nothing else."

Here's the Office

designed and built for you *in the best location*

IF you contemplate moving, or seek larger offices, or desire a location that is accessible and sufficiently exclusive, or want the service, including nurses, so important to the smooth conduct of your business the Medical Arts Building of New York City will *interest you.* It is one of the most modern and complete buildings in the world for physicians, surgeons, and dentists IT IS NOW OWNED AS AN INVESTMENT AND UNDER NEW OWNERSHIP-MANAGEMENT This means a great deal to every tenant.

Although the rental of space is reasonable, the service is beyond criticism It includes

24-hour nursing service. Nurses in any number, available by the hour Emergency phone service controlled by the Doctors' Telephone Service Bureau that keeps you in touch with your patients day and night Also telautographic service clearing through a central office Day and night elevator service Complete open hospital, including operating rooms, laboratories, private and semi-private rooms

For information concerning the space now available, call Regent 9932 or write the Medical Arts Building Or see your own broker

ANNUAL REGISTRATION OF PHYSICIANS IN MASSACHUSETTS

The proposed annual registration of physicians in Massachusetts does not seem to be popular with the physicians of the State if one may judge by a vote taken in the Middlesex East District Medical Society when the proposition received only one vote, and with fifty-five against it. The New England Journal of Medicine of *December 13 prints* a letter which gives the following reasons for the opposition—Editor's note

In addition to the nuisance to physicians which is probably only the least objectionable feature of the bill, sentiment seemed to be that no physician who has honestly obtained his license to practice medicine should be liable to its suspension for so trivial a matter as failure to re-register It is also felt that annual registration would furnish little information additional to what the Board already has We do not understand why lists and supplementary lists cannot be published as proposed from records which the Board has already has Doubtless the physicians of the State would be quite willing to be assessed $12,000 if they felt that either they or the public would receive commensurate benefit, but in the judgment of those who attended these meetings there is nothing in the proposed bill to convince them that any benefit will result.

THE STUDY OF ANTRUM DISEASE WITH THE AID OF INJECTION OF IODIZED OIL*

By GEORGE D WOLF, M D, NEW YORK, N Y

CHRONIC Sinusitis rarely terminates fatally and death cannot very often be attributed or traced directly to this condition This is the probable explanation of the comparative indifference to this disease displayed on the part of the majority of the profession

Tonsillectomy has grown into such popularity that it has become almost a "panacea" for all ailments, especially for frequent colds and all sorts of nasal disorders While one may not deny its usefulness for repeated attacks of Tonsillitis (not sore throats) and in selected cases where they are the seat of infection, the promiscuous removal of tonsils certainly is a great disappointment in those cases where the sinuses are at fault This cannot be stated too forcibly because the physician frequently refers the patient to the Rhinologist with a request to remove the tonsils, where, as a matter of fact, if more freedom for study and observation be given the Otolaryngologist, the real cause of the patient's complaint could be traced to the paranasal sinuses

When a patient suffers from some abdominal condition for instance, it is not infrequent to submit him to early painstaking observation Most elaborate laboratory tests are made before any definite procedure, either surgical or medical, is decided upon Both the surgeon and internist collaborate Is there any wonder that results are gratifying in a large percentage of cases?

Unfortunately, this does not hold true with patients suffering from rhinological conditions We must bear in mind that while the physiology of the nose and paranasal sinuses is specific and different from that in any other region of the body, the general principles of pathology are applicable just the same as in abdominal or gynecological organs Diagnosis in this region is at times as difficult as elsewhere It is true that though the nose lends itself to inspection readily and many pathological conditions are self-evident, we must not forget that the paranasal sinuses are out of reach of our visual field Unless these difficulties in diagnosis are always borne in mind, many useless treatments and nasal operations will be performed

Rhinological diagnosis bears a very close analogy to diagnosis elsewhere in the body When one has seen a patient once or twice with, let us say, acute pain in the right upper abdominal quadrant, radiating to shoulder, necessitating a hypodermic injection of Morphine Sulphate for relief, and if in addition to this the patient develops jaundice during an attack, one can be reasonably certain that the patient suffers from Cholelithiasis It may then not be necessary to X-ray the gall bladder region or examine the stomach contents, etc But not all our patients present such clear typical "text book" pictures

Precisely similar situations exist with patients suffering from pathological conditions in the upper respiratory tract To illustrate A patient presents himself with a history of recent grippe followed by very severe frontal unilateral headaches, worse on arising and gradually subsiding in the afternoon only to reappear the following morning Examination reveals the patient to be tender over Ewing's point or over the ethmoid region, and rhinoscopy shows obstruction from a high deviated septum to same side, possibly hypertrophied middle turbinate on same side and some creamy purulent material coming under pressure from the middle meatus We know we are dealing with an acute frontal or ethmoidal sinusitis, or most often both Another patient will give a similar history, but the pain is over the cheek region The patient has already consulted a dentist for toothache who has pronounced the teeth negative Patient is very tender over the antrum region and may have some oedema there Transillumination shows a markedly obscured antrum Irrigation yields a great deal of pus Here, of course, the diagnosis of acute empyema is very simple and very evident

THE DEAN, 302 East Twentieth Street, NEW YORK CITY

Iodized oil in the series of cases demonstrated here was used in those cases where the radiographic report was "diminished illumination" due to pus, granulations or thickened mucous membrane Upon puncturing the sinus no free pus was obtained Iodized oil was used for the purpose of determining to what degree the mucous membrane was involved and whether polypi were present This work is rather recent. Not enough has been

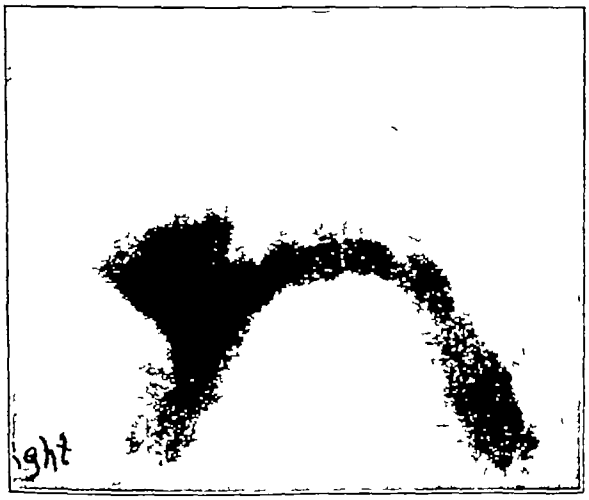

FIG 2, CASE II
Nose-chin position, right side filled with iodized oil Note marked thickening of mucous membrane

done to warrant definite conclusion There is reason to believe that with greater interest displayed by more Rhinogolists and Radiologists, by improvement in technique and better interpretation, this procedure will become a routine measure in selected cases of sinus disease In my own limited experience, it has been of great help in a moderate number of cases The following is a fair representation of this class

Mrs R B, Case No 11 (Fig 2), 26 years of age, mother of two healthy children, presented herself in February, 1926 Her general appearance was that of perfect health, of good color and well nourished Menstrual history negative Past history negative for any constitutional disease Chief complaints were nasal obstruction, discharge and generalized headaches These latter were not localized in any particular place but were more pronounced in temporal regions, were without definite relation to time of day but were present, as she expressed it, all the time and were dull in character Rhinoscopic examination showed the mucous membrane to be generally congested and hypertrophied X-ray report was "Mild involvement of Right Antrum There is a circular shadow on the floor of this antrum which is either a large polyp or a dentigerous cyst. Left Antrum Normal" Puncture of both antri brought forth some shreds This patient would not stand for repeated irrigation The anterior tips of the middle turbinates and the lower border and posterior tips of both inferior turbinates were then removed While there was temporary relief to the breathing, the discharge and headaches persisted In October, 1927, patient was resubmitted to X-ray with and without Iodized oil Here, marked thickening of both antri was revealed, more so on the right side A Caulwell-Luc operation was performed and X-ray findings confirmed Her headaches have disappeared and to date she has been free of them Breathing is satisfactory and the nasal discharge is gradually clearing up

Case No III Miss M McI, aged 25, single, School Teacher, presented herself in January, 1925, complaining of repeated head colds and discharge into her throat, especially when lying down A clinical diagnosis of deviated septum and left ethmoiditis was made and patient was operated on She called on me several times afterward stating that the relief was but slight In October, 1927, she was submitted to thorough investigation, including Iodized oil Both antri showed considerable involvement, worse on the left Irrigation showed the right to contain a small amount of pus After repeated irrigations without improvement in symptoms, a Radical Double Antrum operation was performed The mucous membrane of the antri was found to have undergone marked polypoid degeneration To date she has been very much relieved by the operation and has gained some weight, something she could not accomplish before

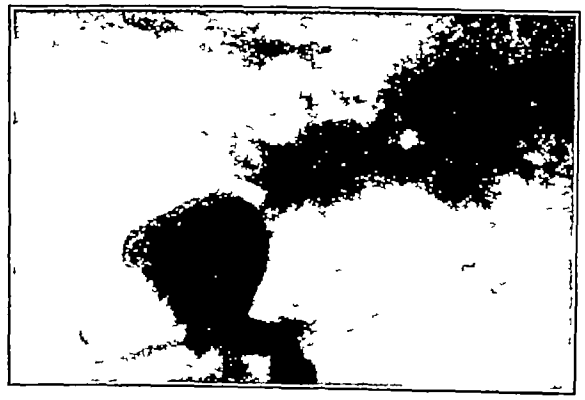

FIG 3, CASE IV
Antrum normal, left one filled with iodized oil, lateral position

Figs 3, 4, Case IV, illustrate what one may expect to see when Iodized oil is used in a normal sinus The following are to be noticed

1 Depth of shadow
2 Edges are very even

Most often, however, the situation is quite different We obtain a history of long standing nasal obstruction and headaches, but without definite localization and without consistent relation to the time of day, together with intermittent sneezing, frequent "cold in the head," general asthenia and loss of appetite On examination, we see hypertrophied tonsils, a deviated septum or hypertrophied middle or inferior turbinates, or a combination of any of the above The nose is filled with mucoid or muco-purulent material One of the above pathological conditions or a combination of all is giving the trouble The presence of polypi in the nose only serves to complicate matters because their origin must be determined A history of indigestion and obstipation adds to our confusion If these symptoms, moreover, are seasonable and occur periodically it adds to the difficulty in diagnosis, especially if patient admits sensitization to any food or inhalant

In some exceptional cases the history and symptomatology point definitely to one condition, and after painstaking investigation something else entirely unsuspected is found Occasionally the patient vehemently denies luetic infection He may have a healthy family and there is no particular reason to suspect venereal disease and in spite of this yield a 4 plus Wassermann, and his nasal condition show improvement under specific treatment. Occasionally a disturbance in the internal secretory apparatus plays some role in the upper respiratory mechanism

It is in these puzzling cases where the laboratory is frequently of great help The most frequent agent to which we resort is the Roentgen Ray While some writers claim that even a negative X-ray examination of the antri does not exclude disease it is safe to say, however, that this is rather rare, and for working purposes one may assume that there is no involvement, providing the technique and interpretation are reliable In one instance the Radiographer reported a particular individual negative for sinus disease My own interpretation convinced me that the antri were involved Subsequently, I washed both antri in the presence of the Radiographer and obtained pus

The cases I am interested in are those where the X-ray report is "diminished illumination" of one or both antri, and on puncture only shreds of various quantity are obtained Here further study with Iodized oil has been of great assistance

While the findings in the study of antrum disease hold good for other sinuses, the antrum was selected for study because

1 It is more commonly involved than any of the others
2 Antrum disease causes a variety of symptoms which can be easily attributed to any of the other paranasal sinuses
3 In spite of the fact that it can be easily reached both for diagnostic as well as surgical purposes, it is very frequently overlooked

Case No 1 (Fig 1) is illustrative of the point and is selected from a fairly large number of similar cases L W, 34 years of age, U A, Insurance Broker, has been suffering for the past five or six years with clogged feeling in nose, post-nasal dropping especially in the morning, also has had Bronchial Asthma for past five years Has been subjected, within the past five years, to five nasal operations, one for submucous resection and the others for removal of nasal polypi and

FIG. 1 CASE I

Forehead-nose position Right antrum filled with iodised oil Note haziness of shadow and irregularities of its edges

probably an ethmoidectomy, and one for removal of right inferior turbinate X-ray showed very shallow frontal sinuses, ethmoids diminished in illumination, both antri markedly involved, more on the right side At operation, the right antrum was literally filled with gelatinous polypoid masses The left one was involved to a lesser degree Two small yellowish masses were removed, and because of their suspicious macroscopic appearance were sent to the laboratory and reported as Choleosteoma

Iodized oil is omitted when the X-ray is negative beyond doubt or when involvement is marked and puncture reveals pus or muco-pus In the latter, the diagnosis is definite and treatment depends more or less upon the judgment of the attending Rhinologist and the faithfulness in attendance on the part of the patient

Case No VIII (Fig 7, 8), A A, 21 years of age, married, Italian, Shoemaker by occupation Chief complaints were frequent

FIG 6, CASE VII
Child, age 8, both antra involved, left morcso

colds, difficulty in breathing and pain above the left eye He had nasal operation by one Rhinologist three years ago and a second operation by another Rhinologist one year ago At the second operation a piece of ivory was inserted for correction of the nasal deformity

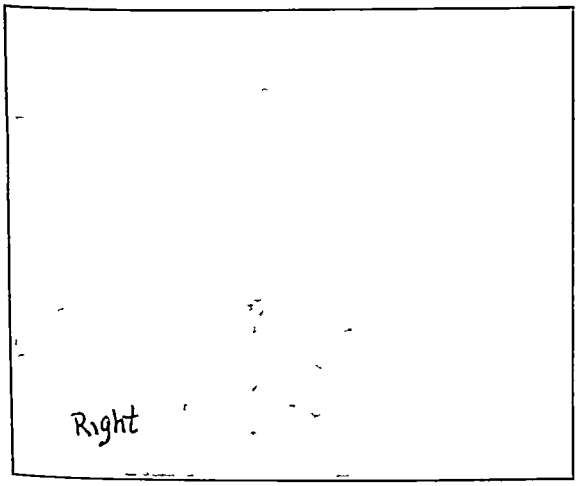

FIG 7, CASE VIII
Left antrum, with iodized oil, shadow very irregular

but without symptomatic improvement He had never been X-rayed before Roentgen ray this time showed a Pan Sinusitis on the left side Iodized oil injection revealed a uniform round mass concaved above (the Iodized oil gives a dumb-bell shape of a shadow) Wassermann was negative This patient would not submit to operation It is therefore impossible to say whether the mass is a large polyp, cyst or neoplasm, but that there is a mass the Iodized oil definitely demonstrated In this instance, the value of Iodized oil cannot be questioned even by the most skeptic

COMMENTS AND CONCLUSIONS

It is very difficult to touch upon the subject of additional aids in diagnosis of Antrumitis without raising the question of classification

FIG 8, CASE VIII
Lateral position The iodized oil casts a dumbbell shadow showing a mass bulging up from the bottom of the antrum

of pathology of nasal disease, indication for operation, choice of type of operation and other moot subjects The scope of this paper naturally does not permit us to touch upon the salient points adequately I hope to be able to discuss the subject in greater detail in another paper, at some future time

Iodized oil in diagnosis of sinus disease has been used recently by a number of men I believe it has not met with the enthusiasm it merits on the part of both Rhinologists and Radiologists Not enough of this work has been done by one individual to warrant any positive statements It would behoove any of our large institutions to institute this method as a routine procedure so that the profession at large may become more interested in this subject

From my own limited experience I can only

3 No filling defects The oil reaches all the normal landmarks of the antrum

If the above is taken as a standard, assuming the technique to be good, any deviation from it may be considered as abnormal providing the clinical symptoms and history warrant such a conclusion

Case V (Fig 5) shows appearance of mucous membrane in acute polyposis Dr K. complained of severe right-sided head colds and obstructed nasal breathing on same side Clinically, the picture suggested antrum disease Puncture yielded a clear serous fluid under pressure During subsequent irrigation a large polyp appeared in the middle meatus which was removed There is little doubt that this polyp came from the antrum through the ostium Here the Iodized oil was used in the hope that it may prove of later clinical value in judging whether this process is progressing or subinvoluting

Case VI was a case of acute purulent antrum disease or possibly an exacerbation of an old process P. C was operated by me about six months previously Chief complaint was obstructed breathing No X-ray was taken and a submucous resection was done on him at that

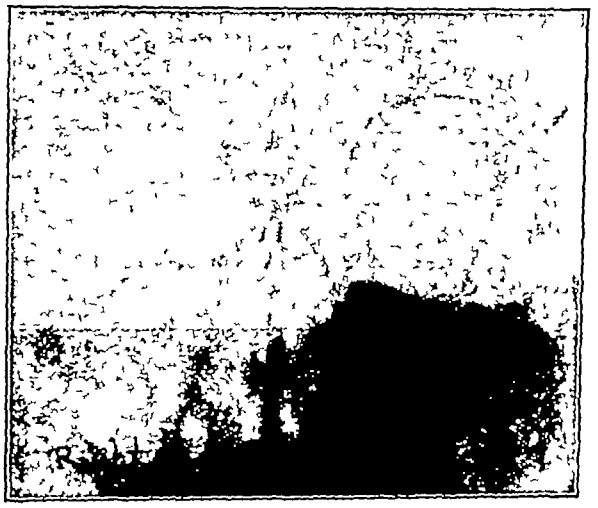

FIG 4—CASE IV

Antrum normal, left one filled with iodized oil, anterior-posterior position

time He returned complaining of a severe cold in the right side of the nose X-ray showed marked clouding of right antrum and puncture brought forth pure gas I used the oil on him for precisely the same reason as in previous case

Case VII (Fig 6) S G, is that of a child aged 8 years It is quoted here for two reasons Because it illustrates that in properly selected cases, even in young children, this procedure is feasible, and also that in spite of the fact that two previous X-rays at various times, as well as recent one (without oil), pointed to marked pathology in the left antrum and mild pathology in the right, Iodized oil reversed the decision and quite justly so

This little patient was brought to me in March, 1926, aged 6 years then, with the object of having her tonsils and adenoids removed She had almost continuous colds in the head with nasal discharge On examination both nasal vestibulæ were literally filled

FIG 5, CASE V

Appearance of mucous membrane in acute polyposis

with muco-purulent material Her parents were told that the child had but a slight chance to benefit by the Tonsil and Adenoid operation because her main trouble was in the sinuses Three months after Tonsil and Adenoid operation, symptoms persisting, the patient was submitted to X-ray with a report that there was a haziness of the sinuses She was treated with argyrol tamponage and suction irrigation Proper diet and hygienic measures were also instituted Very little relief resulted from these measures, In March, 1927, the child was again X-rayed This time the report was "Chronic Sinusitis manifested principally in the Ethmoids and Left Antrum which seems to extend into the Sphenoids" The same treatment was instituted as the previous year with approximately the same unsatisfactory results In November, 1927, the parents became impatient requesting that something be done for this suffering child This time the X-rays showed some involvement of the ethmoids and both antri, especially the left Iodized oil showed more involvement of the right Puncture confirmed these findings About six irrigations were required to clear up the left side The right antrum is still under treatment

hemorrhage accompanied by air hunger It is important in differentiating between gall bladder or appendicular colic and ruptured ulcers In the former the patient exhibits marked restlessness, turning and twisting with the pains, in the ulcer case, however, the poor victim guards against any movement and remains in a tense fixed position

Our local examination should be as definite and complete as possible in abdominal surgery, because at this period we are usually in process of arriving at a diagnosis If the case demands surgery, then an accurate diagnosis is very desirable. Frequent diagnoses of the so-called acute surgical abdomen reflect upon the ability of the surgeon If we have a definite diagnosis, we can better plan the location of the incision, the method of operating, etc, thus sparing the patient from prolonged shock and possibly saving a life in the real critical case. It is always much safer to plan the operation for the patient than to attempt to fit the patient to some stereotyped operative procedure. A live patient with his appendicular abscess drained is a better monument to surgical skill than a dead patient whose badly diseased appendix has been removed A post operative hernia may be more to be desired than a well closed abdominal wall on a dead patient In other words we must attempt to grade the risk of operation to be within the limits of safety for the individual patient. So often in intestinal obstruction cases we allow our curiosity to overbalance our good judgment and instead of doing an enterostomy or colostomy, we attempt to deal directly with the cause of the obstruction and thereby overstep the bounds of safety of the patient How much better and more safe it is in many instances, to relieve the obstruction at the first operation and later remove the cause when the patient's condition has improved

If one is to balance against the known risk of a certain type of operative procedure, the life of a patient—and that is what we always should do —certain laboratory studies are of importance In some instances the ordinary routine urinary examination will suffice, in others such as prostatics more extensive urinary tests are necessary, such as the phenolphthalein and Mosenthal tests Blood chemistry studies, however, furnish us with such a great amount of reliable information, that in many instances they should not be neglected Where there has been impairment of renal function, the blood nonprotein nitrogen and creatinin give us definite information relative to retention In the diabetic the blood sugar determinations are of paramount importance because of the frequency of high or low renal threshold which makes the urinary examination not entirely reliable In the patient with intestinal obstruction, blood chemistry studies are not only of diagnostic and prognostic value but also point the way to rational therapeutics An increase in the blood N P N and the carbon dioxide combining power occurs in this condition The decrease in blood chlorides has pointed out the value of saline in the treatment of obstruction cases generally and particularly in the paralytic type In the diagnosis of conditions of the biliary tract and in estimating the risk in these cases, certain tests are of value The various functional tests depend in the main upon the ability of the liver to take out from the blood stream certain dyes as rose bengal and some of the sodium salts Before considering serious operations upon the biliary tract, accurate estimates of the reserve function of the liver are essential In cases presenting jaundice, the intensity may be recorded from day to day by comparison of the color of the blood serum with a standard potassium bichromate solution Normally there is a certain amount of bile pigment in the blood The so-called normal icterus index is from 3 to 6 This may be increased nearly tenfold before clinical jaundice is evident Jaundice may arise in several different manners Sometimes it is difficult to tell what is causing it. The Vandenberg test is of great value here This test is based upon the fact that bilirubin which has actually been passed through the biliary tract gives an immediate reaction with Erlichs diazo reagent whereas bilirubin which has not done so gives a delayed reaction In other words an immediate reaction suggests an obstructive jaundice and a delayed reaction a non-obstructive origin

The question of anesthesia in surgery is still a mooted one. Certainly there has been an increasing tendency to depend more and more upon local or regional anesthesia Also the gentleness of manipulation required for use of local anesthesia has been a much-needed lesson to those of us who have been inclined unconsciously to rough handling of tissues There are many operations which can be performed by the average surgeon under regional anesthesia with comfort and safety to the patient. There are some operations which require the administration of a general anesthetic even when an expert in the use of local is available. Those of you who have used regional or block anesthesia in abdominal work have marvelled at the complete relaxation of the abdominal walls and the lack of tendency for the patient to force intestinal coils out of the incision During the past year I have used regional block anesthesia for several gall bladder operations in bad risk patients and have been more than pleased For a simple drainage operation, a good block is satisfactory while for cholecystectomy more detail of injection is required Of course the small operations such as removal of tumors of skin, small benign tumors of the breast, amputation of fingers and toes lend themselves well to the use of local anesthesia If one really desires to use local anesthesia, it is quite essential to provide himself with proper syringes and needles, for there is nothing more conducive to irritation and failure than improper

say that it has been of great help in some obscure cases, and sincerely hope that more Rhinologists will resort to it We must certainly all agree that there is plenty of room for improvement in our present method of diagnosis of paranasal sinusitis

A diagnosis of paranasal sinus disease cannot be made on either the history, physical examination, or *x*-ray report alone All the above must be considered together Either the rhinologist must be able to interpret the films himself, or consider the roentgenologist as his consultant and discuss the *x*-ray findings with him It is also advisable to have all new cases *x*-rayed before operation on them If we would give our patients nearly as much attention before operation as we do after, our results undoubtedly would be much better

THE LITTLE THINGS IN SURGERY*

By ARTHUR M DICKINSON, M D, ALBANY, N Y

IN this day and age, when the attention of the world at large is focused upon the big things, it is difficult indeed to direct our gaze, even momentarily upon the small and seemingly trivial things In the business world of today million dollar deals are common, in the engineering world buildings attain unheard of heights and we all live at a terrific pace So it is in the surgical world of today Radical and more extensive operations are supplanting the less complicated procedures Simple drainage of the gall bladder has been largely replaced by cholecystectomy, gastroenterostomy for ulcer is yielding more and more to resection Thus our attention is largely attracted by the big things—the spectacular ones —the daring ones The young physician just commencing to practice feels the thrill of all this and decides to emulate his elders With our gaze fixed so intently upon the big things in surgery, we are prone to overlook the little things We are very likely to forget that these masterly surgical procedures are builded upon the smallest details and upon which they depend for their success It is some of these small things that I desire to discuss with you today

The first of these is our method of approach to the patient Some of us have been endowed with a good bedside manner but all of us can and should cultivate it The first impression we make upon the patient and the family may be a powerful determining factor in the outcome of that case If we instill confidence in their minds, the battle is half won We must appear courteous and gentle but also firm The bedside is no place for a display of temper or undue haste

The importance of a good careful history cannot be over stated Frequently in the face of what appears to be a perfectly typical case, we neglect the history taking and to our chagrin find at operation conditions other than we expected but which would have been revealed by a careful history How many cases of gastric crisis of tabes are operated upon with the diagnosis of an acute abdomen? We do not know but certainly there would be less if before operating a careful history and physical examination were obtained Only recently I saw a patient in such an attack and his abdomen bore the scars of five operations Fortunately he volunteered the correct diagnosis which had recently been made by a careful physician and so perhaps saved himself a sixth operation In many instances the diagnosis of an acute surgical condition of the abdomen can be made with the history alone For instance, the typical history of an acute appendicitis is often of more value in diagnosis than the physical examination In chronic cases this is likewise true The diagnosis of a gastric or duodenal ulcer can usually be made simply upon careful questioning of the patient The differential diagnosis between chronic appendicitis, if there be such a condition, and some disturbance of the right kidney or ureter will depend much more upon the history than upon the physical findings So it behooves us to be most painstaking with our interrogations of the patient

In proceeding with the physical examination we must not confine ourselves to the area complained of It should be a routine to give every surgical patient, a quick complete physical examination, including blood pressure reading, before the local examination is made This procedure will eliminate many unnecessary and oft times fruitless operations If we test the pupillary reactions and knee jerks we are not so liable to confuse an attack of gastric crisis with a perforated ulcer or an acute gall bladder The condition of the tongue will often furnish considerable information It is really the barometer of the intestinal tract If it is moist we know that the illness has not existed sufficiently long to cause serious dehydration of the patient If it is dry we realize that the patient is critically ill and will require careful attention A chest examination will sometimes save us from the embarrassment of operating upon the abdomen when the pathology is in the chest and the abdominal symptoms are reflex Especially is this true in children, where a pneumonia is easily mistaken for an appendicitis The general attitude of the patient may give us a clue to the diagnosis too The pinched, pale worried facial expression seen with severe intra abdominal lesions is very suggestive Restlessness may be another important sign We see this in severe

* Read before the Semi annual Meeting of the Clinton County Medical Society, at Plattsburg, N Y, May 15, 1928.

is most surely indicated Our ideas in regard to drainage are undergoing a 'chance for we use fewer drains today than we did ten years ago As far as drainage after cholecystectomy goes, those who do not drain are welcome to their opinion Having lost one patient apparently due to a slipping of the ligature on the cystic duct, where no drainage was used, I am somewhat biased in favor of a small drain A soft rubber drain tied loosely to the cystic duct stump is routine now It causes no delay in the healing of the wound and provides some comfort for the operator In general drains should be removed as soon as safety will permit They should be started out or twisted within forty-eight hours after operation In some instances they can be removed within seventy-two hours Of course where there has been considerable frank pus, prolonged drainage must be provided There is one little life saving procedure, which I wish to emphasize In the case where an intestinal resection is done, a tube enterostomy located just above the site of anastamosis acts as a very efficient safety valve It allows the escape of gas and liquid intestinal contents and prevents undue strain upon the suture line If correctly done, no permanent fistula remains after removal of the tube We often question just how far it is safe to proceed with an operation We are in doubt as to whether we should remove that gall bladder or just drain it after having spent considerable time working in the pelvis Here is where the value of the surgical team comes in The competent anesthetist, familiar with your routine should be able to answer the question for you The final decision is the surgeon's but it is wise to heed the warning of the anesthetist

Postoperative treatment is often a big factor in determining the outcome of a given case So often we have a routine for such treatment and after operation turn over the treatment to an assistant Certainly in some instances this is unwise Shock follows many operations and if at all severe requires attention Hot water bottles and electric bakers provide heat, elevation of the foot of the bed brings to bear the aid of gravity and intravenous solutions such as glucose and saline will increase the fluid bulk within the circulatory system Prompt restoration of the fluid balance following every operation should be the goal If the patient cannot take sufficient fluids by mouth, then we must see that he gets them by other routes, by rectum, under the skin or intravenously The acidotic type of vomiting which occasionally follows administration of a general anesthetic will often yield promptly to the intravenous administration of glucose solution In these acidosis cases the value of orange juice by mouth must not be forgotten In the obstruction case saline is indicated on a basis of the lowering of the blood chlorides seen in the toxemia of obstruction Prolonged vomiting should be treated with gastric lavage Better yet, a small duodenal tube such as the Levine tube, is passed through the nose into the stomach and fastened in place This provides constant drainage of the stomach and obviates the necessity for frequent introduction of a stomach tube If the patient is able to drink water he washes his own stomach and at the same time probably absorbs some of the fluid Dilatation of the stomach after operation is a not uncommon complication and may prove fatal if not recognized and treated We should be continually on the watch for this condition and should view with suspicion the patient who vomits huge quantities of fluid two or three times in the twenty-four hours Dilatation of the stomach will usually yield to lavage or constant drainage with the small tube I prefer the small tube in many of these cases for the reason that it can be introduced with less discomfort than the large tube and can be left in place for an indefinite period, siphoning out whatever fluid accumulates in the stomach Surgical pituitrin also seems to work quite well in dilatation of the stomach either alone or in conjunction with the tube. After operation just as before, the condition of the tongue is the best index as to the state of the patient's fluid balance Some surgeons feel that morphine should be used very sparingly after operation The relief from pain and anxiety which only a good dose of morphine can bring is the best argument in its favor We know that pain is almost a physiological antidote for morphine and so I feel in the presence of real pain, we should use it freely True there are some patients who have an idiosyncrasy for morphine and its use with them causes mental excitement or vomiting but these individuals are few and far between Careful observation of the state of the bladder postoperatively will often make the patient's convalescence more smooth It takes little time to gently percuss over the bladder region or to investigate the patient who voids small amounts at frequent intervals The patient as a rule does not know that he has a full bladder, all he is conscious of is pain and discomfort Digitalis is an extremely valuable drug to be used postoperatively Unless the patient has been under digitalis therapy before operation, however, we can expect little effect until sufficient dosage has been given The digitalization of the surgical patient is no different than that of the medical patient. Some surgeons who have forgotten their therapeutics, order digitalis in such small doses that no effect is obtained and they then blame the drug Caffein in my experience has proven itself a very valuable drug in the treatment of postoperative cases requiring stimulation of heart and kidneys It acts promptly in most instances and can often be used to carry along a weak heart until the digitalis can take effect Pituitrin is a very excellent remedy in treating postoperative distension Administered alone or in combination with enemata it frequent-

syringes and needles In some instances gas appears to be the ideal anesthetic for the reason that there is less postoperative reaction than with ether For the trivial operation upon the apprehensive patient it is very useful More prolonged operations can be performed if the nitrous oxide is supplemented with some ether Ether, of course, enjoys a popularity resulting from long use and safety in many hands In choosing an anesthetic we should consider the problem as applying to the individual patient There are three angles to this problem The first is the general condition of the patient, the second is the nature and extent of the proposed operation and the third is the ability to properly apply the anesthetic chosen As in planning an operation we fit the operation to the patient, so in choosing an anesthetic we must fit the type of anesthesia to the patient

Preoperative treatment in some cases is not required or there is no time for it In others it may be a necessity The association between gall bladder and myocardial disease is too well known to require discussion Many of these gall bladder cases require digitalization before operation can be undertaken with safety Few acute gall bladder cases require immediate surgery, so there is usually time to get the patient in fair condition In any bad cardiac risk, whether operation is performed under generatl anesthesia or not, preoperative digitalization will save us many anxious moments after operation The diabetic patient should be rendered sugar free or at least gotten under control with diet and insulin before operation In some instances of diabetic gangrene, this is well nigh impossible due to the lowered carbohydrate tolerance resulting from infection The patient who is dehydrated must be filled with fluids if we wish to give him the best chance If sufficient fluids cannot be taken by mouth, they must be given by rectum, under the skin or intravenously The patient with an acidosis due to prolonged vomiting should be brought under control before we add further insult to the chemical upset by administering an anesthetic Glucose in 5 to 10 per cent solution and normal saline intravenously are very valuable in combating this acidotic or dehydrated condition In some instances of acidosis it may be wise to burn up part of the carbohydrates thus introduced by use of insulin, thereby diminishing the formation of the ketones which cause acidosis In the weakened anemic patient preoperative transfusions are of decided value in carrying them through the shock of operation For transfusions, we are using the Scannell apparatus with entire satisfaction, handling 300 to 500 cc of blood with no difficulty No type of apparatus for transfusion is fool proof and all require most careful attention but this apparatus seems to approach the irreducible minimum In transfusion, whole blood is better than citrated blood as fewer reactions develop afterward So unless the problem is one of transportation of blood, whole blood is to be preferred In the jaundice case we should know the coagulation time of the blood If this is increased, the administration of calcium chloride solution (10 per cent) in 5 cc doses, daily for two or three days, will bring it within normal limits The various hemostatic sera such as fibrogen, thromboplastin and horse serum are of little value in the presence of jaundice. They do act exceedingly well in ordinary hemorrhage cases, however In the patient with hemorrhagic purpura, coagulation time of the blood may be normal but the bleeding time is greatly increased As this condition is largely due to a diminution of the blood platlets, transfusion of whole blood is the best therapeutic agent

The operation itself should proceed with the minimum of traumatism of tissues and the maximum of speed compatible with the nature of the case All unnecessary handling of tissues, particularly intestine, and exposure to chilling are to be avoided Rough treatment of the intestines is quite likely to result in a postoperative ilous Speed in operating should never be the primary consideration but we should not subject a patient to prolonged anesthesia and shock arising from avoidable delays The ease and speed with which an operation is performed will depend upon the accuracy of the preoperative diagnosis and the efficiency of the surgical team Complete peritinealization of all raw areas is receiving considerable attention today If we cover all these areas which have been deprived of their peritoneal layer, we minimize the chances of postoperative adhesions and obstruction either early or late Frequently small wounds may be covered with tabs of omentum This procedure is particularly valuable when closing a ruptured ulcer In the pelvis which has been left rather raw by the removal of an inflammatory mass, very frequently the sigmoid can be used to partly cover it, thereby preventing a loop of small intestines becoming adherent and obstructed Whether to drain or not to drain is a source of worry in many cases If we do drain, we produce adhesions, if we do not drain, the patient may die of infection We recognize that drains do traumatise the serous coverings of viscera and thereby delay healing but we also appreciate the need of drainage in some cases The hard rubber tube should be discarded for the tube made of soft flexible rubber Wherever possible the so-called cigarette drain should be substituted for the later Gauze packing should always be surrounded by rubber tissue where it passes through the abdominal wall because of the pain and difficulty of removal if the rubber tissue is omitted In the main, we feel that where the fluid in the peritoneum is serous we do not require drainage We know that the peritoneum is able to take care of a certain amount of infection anyway If the fluid is purulent, then drainage

When I began to immunize against measles in April, 1914, I did not fully appreciate the importance of local and tissue immunity, but chose the nasal route, because it seemed logical to follow the path through which infection took place naturally Only perfectly healthy infants in the fifth month of life were inoculated, and the relative temporary immunity was converted into an active permanent immunity It may be that this immunity is still further strengthened by subsequent natural exposures to the disease Following the inoculation there is often after about two weeks a slight rise of temperature, and a few spots, but no Koplik spots or distinct catarrhal symptoms [1] The method probably acts by causing primarily a local tissue immunity in the nasal mucous membrane, the first line of defense. The method could also be applied to older children by following the inoculations in three or four days by an injection of convalescent serum This could be applied to any children, whereas the method which is used at present is applicable only to the small number in whom exposure is known

5 *Objections which have been made to the method* A severe attack might result from the inoculation I have never seen it As in vaccination against smallpox, certain precautions must be taken, only healthy infants inoculated

Even if mild it might produce a severe attack in another child in the family I have never seen it The probable explanation is that there being no distinct catarrhal symptoms this danger is absent

It is not esthetically correct This objection might be made against autogenous vaccines prepared from various excretions of the body, Calmette's method of immunizing infants against tuberculosis

The number of inoculations (165) insufficient. This would be a valid objection in a disease which ninety-seven percent of non-immunes contract is slightly communicable such as scarlet fever, poliomyelitis, but not in one like measles in which the disease when directly exposed

I am willing to concede that the method is crude, as first attempts are apt to be. I simply wish to emphasize the underlying principles upon which any attempt to actively immunize should be based, and believe that the method eventually will be some modification of the one which I have described

1 Herrman, C, *Arch Pediat*, xxxii (1915), p 503, Ibid xxxix (1922), p 607

2. Nassau, E., Monatschr f Kinderh. xxii (1922), p 54

ly stimulates the intestinal musculature and results in the expulsion of flatus and fecal material It may be repeated several times in the twenty-four hours with very little danger

In conclusion, I wish to say that I have only touched the high spots of this subject with a little more emphasis here and there, I am confident that by attention to some of these little things surgical results will be more satisfactory to all of us

ACTIVE IMMUNIZATION AGAINST MEASLES*

By CHARLES HERRMAN, M D, NEW YORK, N Y.

I SHALL omit a discussion of the various microorganisms which have been described as the cause of measles, and also the use of convalescent serum, and the antitoxins of Ferry, Tunnicliff and Degkwitz I shall discuss the subject briefly under the following headings—1 Active and Passive Immunity 2 Local and Tissue Immunity 3 Active and Passive Immunity in Measles 4 The Method employed 5 Objections which have been made to the method

1 *Active and Passive Immunity* In passive immunity the patient is supplied with the antibodies which he lacks or has in an insufficient quantity It is a form of substitution therapy, similar to the administration of thyroid extract to cases of hypothyroidism The patient may be compared to a small child who is always carried He reaches his destination, but he does not learn to walk Such passive immunity is temporary, usually lasting only a few weeks, and has the added disadvantage that is applicable only when there is a known exposure to the infection In active immunity on the other hand the patient makes an effort himself, he learns to fight his own battles, the immunity derived is more or less permanent, and can be employed at any time.

2 *Local and Tissue Immunity* On this subject I cannot do better than quote a few sentences from Gay's article in Jordan and Falk's recently published work on "The Newer Knowledge of Bacteriology and Immunology"—"In spite of the importance of antibodies as an indication of a protective reaction, a very marked immunity may exist without their presence, and their presence alone does not insure protection" "In other words the striking and important new properties of the blood serum in conditions of immunity, have to an undue extent distracted our attention from the mechanism through which these properties arise Too little attention has been paid to the cells of the body" "The antibodies of the plasma important as they are in diagnosis and at times in serum therapy, are at best only a reflection of more fundamental processes that have gone on in the cells" "Local immunity rests on the demonstration that a given area of the body may be protected by the topical application of a given antigen without involving a more generalized immunity" "There is now overwhelming evidence of a truly localized form of immunity confined under certain conditions and in response to certain infectious agents, to localized areas or cellular groups of the body, and representing not only the natural resistance enjoyed by many cells, but also the exaggerated and important conditions of true active acquired immunity"

3 *Active and Passive Immunity in Measles* Certain experiences with the use of convalescent serum in passive immunization against measles, tend to make one doubt whether the immunity in this disease is entirely humoral In large centers of population where practically all mothers have had measles, infants under two months of age are immune to measles[1] Nassau[2] injected the serum of such infants into a number of children who had been exposed to infection with measles, and failed to protect them against the disease It is also surprising that the serum of adults who have had the disease in childhood, and who are *absolutely* immune, is not as effective in immunization as the serum taken from a recent case. Aside from the temporary character of the immunity obtained by the injection of convalescent serum, it has the great disadvantage that it is only applicable when there is a known exposure It is very valuable in institutions which care for infants and young children when they are known to have been exposed, but these constitute a very small percentage of the total number of cases which occur in a community when the disease is epidemic

4 *The Method employed* I have utilized the following facts Seventy-five per cent of the deaths from measles occur in infants under two years of age, therefore in order to control the disease it is necessary to immunize in early infancy In large centers of population, infants under five months are *relatively* immune, it is therefore unnecessary to attentuate the virus The infectious material is present in an active form, from about forty-eight hours before the eruption appears until it becomes distinct In order to actively immunize, it is not necessary to isolate the microorganism or to grow it in pure culture Vaccination against smallpox is probably the most reliable and certain-method of successful immunization known but the infectious material has never been identified In measles the infectious material passes from the nasal mucous membrane of the patient to that of the infected child

* Read before the Medical Society of East New York, Nov 26, 1928

MEDICAL CONFERENCES

Doctors and nurses and lay secretaries and social workers all like to get together and philosophize on health problems, and theorize on the fundamental principles of health activities Physicians develop creeds and principles of belief quite as much as theologians do Every month some state journals publish stenographic reports of conferences of county secretaries, or round table discussions at state meetings All these conferences seem to be conducted on the same plan that one person shall deliver an essay on some phase of administrative medicine, and the rest in turn shall praise the speaker for covering the subject so completely, and, then shall proceed to wander far afield in presenting their own observations and theories This course of events is characteristic of county medical societies and district branches, round table discussions on state society meetings, assemblies of county secretaries, and the conferences of state secretaries and editors conducted by the American Medical Association

The Editors of the NEW YORK STATE JOURNAL OF MEDICINE read the other state journals in order to fill the columns of the department "Our Neighbors" with practical suggestions which may be put to actual use by the physicians of New York State While there is never any difficulty in discovering a wealth of practical ideas with which to fill the department, yet the amount of practical suggestions developed in the conferences is small compared with the flood of verbiage and philosophy that flows away when the gates of talk are opened

Conferences of medical societies, like those of churches, are exhibitions of two complementary principles There is theory balanced against practice, impersonal philosophy contrasted with personal responsibility, faith compared with works, the practice of piety set against the practice of religion and of service to discourage the weak and the sick The theory of the usual medical conference, like that of an experience meeting of a church, is that every person present may express an opinion regarding the subject under discussion, and may make suggestions for solving the problems which confront the medical profession That plan is excellent and commendable so far as it goes, but it has two vital defects or deficiencies

1 It allows the speakers to introduce any subject, to pile up inconsequential illustrations and to consume an inordinate amount of time in developing self-evident points

2 It leads to no conclusions regarding the comparative value of the suggestions offered, and to no decision for future action It is true that each person attending the conference may choose one or two suggestions to take home and put into action, but he has the right to expect that the conference should express an opinion of the suggestions A successful medical conference is something more than a bargain counter of disconnected ideas and plans, it is a store house of standard models whose operation is guaranteed, or at least has been demonstrated in a practical field test

Medical conferences which are conducted at the expense of state societies may be expected to develop some practical suggestions which the society may put into action and thereby justify the expense of sending representatives to the meeting Action is the best test of the success of a conference—action, not merely by one or two individuals, but by a whole group If a suggestion cannot be adopted by a state or county society, then the action indicated is to survey the field and diagnose the reason why the suggestion cannot be put to use Some suggestions will be turned down at once by the conferees, and some more will be held for investigation and proof, but if the conference is to justify its existence, its members will adopt one or two definite suggestions and plans for action

Why are medical conferences so often ineffective? The principal answer is that they lack definiteness of purpose Usually the principal speaker fails to ask his brethren to approve and adopt a definite course of action as distinguished from beliefs and principles

A concrete example of a specific course of action decided at a medical conference is that of the meeting of the Public Relations Committee of the Medical Society of the State of New York on November 9, 1928, reported on page 1432 of the December 1st JOURNAL Ten persons participated in that conference, and while the conferees did a considerable amount of theorizing and debating, yet they suggested a specific course of action for each county society to adopt, and they assigned a degree of responsibility to each member of the Committee for securing action by the counties in his district The conference decided what it wanted, and proceeded to secure action

This same Committee on Public Relations also adopted another definite line of action at its meeting on January 15, which was reported in this JOURNAL of February 1st, page 169 The Committee at that time debated the question of the relation of the State Medical Society to the official health agencies, particularly the Departments of Health and Education Extreme views were presented ranging from opposition to intimate co-ordination But instead of stopping with the expression of opposing views, as has usually been the custom with medical conferences, a sub-committee formulated a definite plan of cooperation which was adopted unanimously by the Committee and the representatives of the two state departments As evidence of that cooperation, the conferees adopted a fee list for medical service rendered to crippled children under the new state law

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5058

The Medical Society of the State of New York is not responsible for views or statements, outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

MEDICAL NEWS

The News Department of this issue includes sixteen items, covering fifteen pages The topics are of general interest, and conform to the standards of the JOURNAL, that all its news items shall be of practical value and worthy of permanent record The justification of this policy is the frequency with which references to the news notes are required by the officers and committeemen of the State and County Societies An illustration of the broad scope of the items is that the annual index of the news notes covers about five pages

The news pages of this JOURNAL have a value equal to that of the scientific department. They contain something of interest to every physician

MEDICAL PROGRESS

Thyroxin Studies—W Kornfeld and E Nobel of Pirquet's Vienna Pediatric Clinic sum up some of their discursive researches along this line as follows The original method of testing toxicity and dosage of thyroid substance on the guinea pig has been extended to thyroxin According to the tests, the animals—fed on milk and oatmeal—succumb to 10 to 20 mgm of thyroxin Upon this basis the authors deduce that a child with a sitting height of 50 cm requires a dose daily of ¼ mgm thyroxin, while one of a sitting height of 70 cm requires ½ mgm It is established for both crude thyroid substances and thyroxin that the dose depends in a high degree on the diet of the patient On a strict regimen of milk and oatmeal the danger of a lethal effect is notable, but when the animals are given green fodder their resistance to the action of the principle is greatly augmented Upon animals on this diet thyroxin exerts a powerful action when injected subcutaneously, in contrast to the same when adminsitered per os, but under the old test of feeding with thyroid substance, no such distinction was elicited Although the increasing control of disease by diet is a matter of common observation, this principle has as yet hardly extended itself to the association of special medication with special diet Uusually when a patient is subjected to a given course of medication the diet is of a general type, without the entry of a specific element In the present article the authors do not go into the refinements of diet and there is but slight allusion to vitamins, balanced ration, and the like In fact the authors seem to discount the existence of a vitamin element and the entire question reposes apparently on an empirical basis —*Klinische Wochenschrift,* December 9, 1928

Control of Post-Operative Vomiting by Interstitial Injections—Post-operative vomiting is a condition which M A R Young believes is not considered seriously enough by many men who do operative work (*Canadian Medical Association Journal,* December, 1928, xix, 6) For a number of years it has been his practice to give to every patient who has undergone a major operation an interstitial injection of 1,000 to 1,500 c.c. of saline (Ringer's formula), or a combination of Ringer's saline with 5 per cent solution of dextrose in equal proportions He also makes use of Bartlett's method of adding 30 c c of a 1 per cent novocaine solution per litre of fluid, given in order to make the administration painless The injection is made into the lateral aspect of the thigh This procedure greatly diminishes post-operative vomiting, lessens nausea to a similar degree, relieves the patient of the intense craving for water, reduces the incidence of post-operative distention, and almost does away with the need for catheterization In addition it supplies the drained tissues with fluid, and makes up for that which has been lost during the operation Furthermore, when the patient gets the solution early, before marked blood changes have taken place, it does not require the technical knowledge which is necessary for making intravenous therapy safe. If the needles are inserted so that the solution will run, the amount is taken in an hour or less, and the procedure is painless then and afterward There appears to be no risk if ordinary care is observed and asepsis employed In 1,200 cases only three infections occurred, each one following the addition of a new interne to the staff, suggesting a slip in the technique. There have been no other complications

Infections Associated With Pulmonary Tuberculosis—P Courmont and G Boissel base their study on a material of 442 cases of which 146 are new In addition to associated affections they take account of another group which they term substitutive or alternating Naturally a distinction must be made between true infections, in which the associated organism is equal in importance to the tubercle bacillus, and the merely accidental symbioses In the substitutive group the bacillus of Koch may be present but completely masked by the associated infection These cases may have to be followed up over long periods before their nature is recognized Of associated organisms the authors mention especially the pneumococcus, streptococcus, Pfeiffer bacillus, enterococcus, and pseudo-diphtheritic bacillus The method followed is that of repeated cultures of sputum, in some cases with the addition of hemoculture—the latter, however, is relatively unimportant by reason of the great infrequency of sepsis in these cases The quantitative method of sputum count is necessary in diagnosis The authors made 572 examinations of the sputum of 146 patients during the period 1925-8 Of this number 92 showed Koch's bacillus in pure culture while in 13 others the condition was not a true association, for the secondary organisms were too few in number This left 41 cases of true association of infection, in which the secondary organism was present constantly and in large numbers If but one secondary organism was present the authors use the term monomicrobian and if more than one polymicrobian In a considerable number of these cases the examinations were made on autopsy material The authors analyze their material exhaustively and at times an interesting connection can be traced

A plan for conducting an effective medical conference was presented to the Eleventh Tri-State Conference as reported on page 228 of this JOURNAL The plan is so practical that it is here printed again as follows

"1 The speaker of the day shall prepare his paper with the view of making definite suggestions and proposals for action

"2 He shall send a copy of the paper to each person expected to take part in the conference.

"3 Each person shall come to the conference prepared with definite suggestions regarding the proposals of the speaker

'4 The conference shall take definite action regarding the suggestions"

If these suggestions were generally adopted, medical conferences would be raised from a theoretical to a practical basis

SWEETS OR TOBACCO

A trade war which is raging between two great industries suggests a subject for a rural debating society "Resolved, that sugar is more beneficial than tobacco" Few physicians would support the side of tobacco, and none would advise a person to reach for a cigarette when he felt a desire for sweets Some confectioners used a similar argument at the beginning of prohibition times when they advised drinkers to use candy as a substitute for alcoholic drinks, but that was excellent advice, and the only industry that its observance harmed was already outlawed

It does not seem possible that any group of business men should publicly advertise tobacco for health, or that their advertising propaganda should damage the sugar trade Yet the dealers in sugar and other confectioners' goods are spending their money in order to uphold the healthfulness of their products An indication of the opinion of physicians is that full-page advertisements by the Sugar Institute are carried by seventeen out of the nineteen State Journals whose January issues have been received in this office

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Consolidation of the State Societies—This JOURNAL of February, 1904, contains the following brief news item

"The first bill of the present session was passed by the Senate January 20th It is an act authorizing the consolidation of the Medical Society of the State of New York, and The New York State Medical Association, providing, however, that the respective organizations decide to do so by a majority vote of the members

"The above having passed the Assembly and signed by the Governor becomes Chapter 1 of the Laws of 1904"

The first paragraph of the bill reads

"Section 1 The Medical Society of the State of New York, incorporated by or pursuant to chapter one hundred and thirty-eight of the laws of eighteen hundred and six, entitled 'An Act to incorporate medical societies for the purpose of regulating the practice of physic and surgery in this state,' and continued by chapter ninety-four of the revised laws of eighteen hundred and thirteen, passed April tenth, eighteen hundred and thirteen, entitled 'An Act to incorporate medical societies for the purpose of regulating the practice of physic and surgery in this state,' and The New York State Medical Association, incorporated under chapter four hundred and fifty-two of the laws of nineteen hundred, may enter into an agreement for the consolidation of such corporations, setting forth the terms and conditions of the consolidation and the mode of carrying the same into effect"

udation into the cavity These statements agree with the postmortem findings when there is either no recognizable organic disease or when only the coronary vessels are affected, thus interfering seriously with a ready response by the cardiac capillaries to any sudden demands upon them —*Medical Press and Circular,* December 12, 1928, cxxvi, 4,675

Feeding With Spleen Substance in Various Diseases—O Fliegel writes especially of feeding with splenic substance in tuberculosis of the joints, although he alludes to the fact that the remedy has also been tested in hyperglobulia vera and he might have mentioned other affections in the same connection—certain skin diseases, for example—although a distinction must be made between actual feeding and the injection of splenic extracts The author makes no allusion in this connection to the use of liver substance in pernicious anemia, and as he is associated with the orthopedic clinic of the General Hospital at Vienna it is evident that he is working along a different line, for the theory that the spleen supplies a defense against tuberculous infection is rather old He has tested the method for the past 10 months and upon 20 patients Calf spleen was used, fried in fat in thin slices or shaved into a soup medium It was fed to the patients over a period of four weeks, and repeated after an intermission of 2 or 3 weeks But even as early as the eighth day improvement, both general and local, could be shown, and in several separate directions Apparently no other active measures were employed Of the 20 cases 5 were not taken into account because of imperfect conditions Of the 15 actually considered, 5 made complete recovery and only two were total failures The improvement in the remaining 8 cases was decided The author earnestly requests his colleagues to make trial of splenic feeding in these cases, notably in purulent and fistulating ones, and promises prompt results under favorable conditions —*Deutsche medizinische Wochenschrift,* December 7, 1928

Liver Feeding in Scurvy—H Aron, H Hirsch-Kauffmann, and E Schädrich send a very brief communication with this title from the Pediatric Clinic of the University of Breslau According to Czerny, they state, liver has been used in the nutritive disorders of children in various directions but only recently have the astonishing results of this remedy in pernicious anemia aroused new interest in the subject. Many observations appear to show that the active principle in liver substance is closely related to the vitamins, notably to the antiscorbutic or C vitamin It has seemed therefore desirable to test liver extract in scurvy, and in the absence presumably of clinical material tests were made on experiment animals Guinea pigs were first fed on a scurvy-producing diet and while some were given liver extract at the same time others serving as controls received no liver The liver-fed animals developed no scurvy in a four-months observation period, while the controls succumbed to that disease in 3 to 4 weeks The preparation used was a fresh aqueous extract of liver which was improvised for the occasion by the authors Heat did not destroy the active principle, for the extract retained its potency after five minutes heating in a waterbath An alcoholic extract possessed no antiscorbutic power, nor did the unextracted residue —*Klinische Wochenschrift,* December 23, 1928

Pernicious Anemia, with Free Hydrochloric Acid in the Gastric Contents—The complete absence of hydrochloric acid in the gastric contents in pernicious anemia is now recognized as a cardinal sign of the disease Stanley Davidson gives reasons why it is right that this should be so, but reports an exceptional case in which this sign was not present The patient, a man aged 34, gave a long history of epigastric pain unaffected by the taking of food, though he was suffering from duodenal ulcer There was marked megalocytosis and anisocytosis, a color index over unity, and a van den Bergh reaction classically characteristic of hemolytic jaundice—all signs of pernicious anemia On the other hand, the presence of free hydrochloric acid in the stomach and the absence of leucopenia contraindicated the diagnosis Moreover the patient did not conform to the constitutional type usually met with in pernicious anemia There is evidence to show that the pernicious anemia group tends to approach the acromegalic type The blood condition was present before the perforation of the duodenal ulcer Following the operation the patient was given alkalis and liver by mouth Under this treatment the gastric pain disappeared, there was a rapid increase in weight, and the response to treatment was exactly what one would get in a case of pernicious anemia, but not in secondary anemia The patient was discharged from the hospital looking and feeling well So far as the author is aware, the coexistence of duodenal ulcer and pernicious anemia in a patient has never previously been reported —*British Medical Journal,* December 22, 1928, II, 3546

The "Scrofulate of Syphilis"—R Bané discusses this association of tuberculosis and syphilis, called by French clinicians of a bygone age "scrofulate of syphilis," at great length, naturally from a modernized viewpoint. This expression originated with Ricord who had often noted the severity of the primary lymphnode reaction of syphilis in so-called scrofulous subjects Quite recently

between the associated infection and the clinical behavior of the case, but no formal summary is given —*Journal de Médecine de Lyon,* October 20, 1928

Value of the Pirquet Test in Child Tuberculosis—E Wiegand of Basle, writes at great length and detail on this subject The reaction is one of two great discoveries of recent years in regard to tuberculosis, the other being the fact that all but 3 per cent of adult autopsies show evidence of past infection The value of the test lies of course in its specific character and also in its harmlessness and dependability In the first year of life barely 1 per cent give a positive reaction but at the period before puberty the per cent has risen to 40 or 50 At the age of 20 nearly every one reacts positively, but, of course, a positive Pirquet does not mean that the individual is necessarily in any sense tuberculous, for mostly it merely indicates that the individual is showing a defense reaction The question then resolves itself into what groups of positives have a clinical significance Such groups must clearly be made up of children, and the younger the child the greater the clinical significance Four groups readily isolate themselves, first, children who present clinical tuberculosis, where, of course, a positive reaction is merely corroborative, second, all nurslings and very young children in whom a positive reaction is the sole find, third, Pirquet positives among children of any age who live in a tuberculous milieu, and fourth, children of any age who resemble strongly a parent known to have or to have had tuberculosis In these groups the main question is one of prognosis and prophylaxis, but the author does not get very far in this direction and does not even mention the Calmette vaccine save in a footnote in which he observes that the Pirquet test has nothing to do with the problem of immunization It is, of course, known that according to Calmette the positive test of Pirquet merely means an exaggerated susceptibility to the action of tuberculin —*Schweizerische medizinische Wochenschrift,* November 24, 1928

Esthiomene and Lymphogranulomatosis—Wilhelm Frei and Alice Koppel may possibly have proved that the mysterious affection known as esthiomene, lupus of the vulva, and by various other names, is closely allied to, if not actually dependent on, the newly isolated disease known as inguinal lymphogranulomatosis, previously confused with obscure venereal buboes The differentiation can always be made by using a differential skin test and it is this same test which gives a positive reaction in clinical esthiomene Studies of the latter have associated it with old syphilis, tuberculosis, and mere personal filth The vulval lesions also shade without demarcation into an affection of the rectum known incidentally as anorectal syphiloma, etc While many of the esthiomene patients give a history of syphilis it is not certain that the lesions are specific. Frei, the senior author, who is one of the most active students of lymphogranulomatosis, and who devised the differential skin test, will certainly be entitled to credit if in addition he shall have solved the mystery of esthiomene, if it is anything else than lupus Up to the present time he has tested five patients with clinical esthiomene or anorectal syphiloma with his skin test for granulomatosis and has obtained positive results in each case Moreover every one of the patients had at some time suffered from the peculiar suppurating buboes in the groins Chancroidal buboes were easily excluded It should be stated that the anorectal type of lesion can occur in the male and one of the five patients was of this sex The four female patients had all had syphilis Since the element of elephantiasis in these patients is easily brought into association with the destruction of the inguinal lymphatics it is of course possible that other infections in this locality may also be able to cause esthiomene —*Klinische Wochenschrift,* December 2, 1928

Is Angina Pectoris a Form of Urticaria?—G Arbour Stephens recalls that, in 1926, he drew attention to the fact that gastritis and gastric ulcers lead up to heart disease more often than any other affection, even than rheumatic fever Earlier he observed that every case of gastric ulcer gave evidence of calcium deficiency In children this deficiency of lime leads very quickly to a disturbance of the heart, in adults the process is slower, there being an intermediate stage of gastric trouble —severe gastritis or gastric ulcer Stephens has also pointed out that ulceration of the skin, chronic ulcer of the legs, gastric ulcer, and even ulcerations of the heart are evidence of disturbed calcium metabolism In cases of allergy, in addition to other characteristic phenomena, there is a sudden exudation into the pericardial cavity, the cardiac area of dullness is increased, the impulse is very diffuse and the sounds are considerably modified A sudden exudation of an urticarial nature into the pericardial sac disturbs the intrapericardial pressure and is mainly responsible for the agonizing pains of angina pectoris Three things are peculiarly prone to precipitate an attack of angina pectoris (1) Excessive and sudden exercise, (2) overloading the stomach, and (3) emotion or shock In each of these there is a change in the intrapericardial pressure, dependent upon the cardiac capillaries The fact that amyl nitrite, by its direct effect on the capillaries, is of use in angina pectoris confirms the contention that this affection is due to sudden disturbances of the intrapericardial pressure, associated with or dependent upon a sudden modification of the ex-

LEGAL

By Lloyd Paul Stryker, Esq
Counsel, Medical Society of the State of New York

THE LEGAL ASPECTS OF THE PRACTICE OF MEDICINE*

We believe it safe to say that few doctors have paused to reflect upon the legal aspects of their profession until their diagnosis or their treatment in a given case has been assailed by a patient When a physician finds himself playing one of the leading roles in a malpractice drama, and discovers that he has been cast as the villain in the piece, he is ofttimes startled by the realization that every act which he performs in the practice of his profession is governed and surrounded by some well-defined principle of law He learns then, perhaps for the first time, that the practice of medicine has a distinct legal aspect. I have had occasion at various times to suggest the wisdom of including in the curriculum of every medical school at least one course in medico-legal jurisprudence, wherefrom a student might derive a working knowledge of the rules of law which will govern his entire future practice The existence of such courses in the English medical schools, I have been told, has been of great benefit to the medical practitioners of Great Britain During the past three years, as general counsel of the Medical Society of the State of New York, I have had occasion to write semi-monthly editorials for your State Journal, in which I have attempted to set forth some of the leading principles of law with which every doctor should be acquainted Indeed, I have written so much upon this subject that I find it difficult at times to avoid the error of repetition, but I am comforted by the reflection that there are some things which cannot be said too often

Every physician, when he undertakes to diagnose, operate or prescribe for a patient, enters into a distinct contractual relationship with that patient. Upon this relationship the law imposes certain distinct mutual obligations and duties In the first place, the physician or surgeon impliedly represents that he possesses, and "the law places upon him the duty of possessing, that reasonable degree of learning and skill that is ordinarily possessed by physicians and surgeons in the locality where he practices, and which is ordinarily regarded by those conversant with the employment as necessary to qualify him to engage in the business of practicing medicine and surgery"

There was a time years ago when doctors were licensed to practice medicine by the Board of Censors of the Medical Society of the State of New York For many years the licensure of physicians has been placed in the hands of the state authorities, and the law now provides in detail exactly what preliminary education a prospective physician must possess, it defines the length and nature of the courses which he must have taken in an approved medical school, and finally, it requires that he must pass a state examination before being permitted to assume the time-honored title of doctor, and to be admitted to fellowship in one of the greatest of the professions,—that of medicine The fact that a man has complied with all of these legal requirements and has received his certificate to practice, is prima facie evidence that he is qualified to do so, it raises a presumption that he is qualified But this presumption may be rebutted by evidence, and in many cases it is alleged that the physician sued did not possess those qualifications,—this irrespective of the fact that he is a full-fledged member of the profession The issue, then, of his qualification or competency is one which is often still litigated in the courts At first blush, that such an issue may still be tried out, irrespective of the state's certification that the man in question is competent, may seem unjust Upon reflection, however, it will be seen that there is no injustice in permitting an injured patient to allege, and to prove if he can, that a given physician did not in fact possess the qualifications for the particular case which he should have possessed The fact that a young man graduates from West Point is certainly prima facie evidence that he is qualified to act as a full-fledged officer of the Army Most West Pointers have more than proven their capacity, and still it is possible, and on occasion it has been proven possible, for a man to graduate from West Point and still be an incompetent officer The same applies to the Naval Academy, to the law schools, to the schools of divinity, to schools of engineering and other institutions of learning

Take, for example, the great field of surgery A young man who has complied with all the state requirements and has been licensed to practice medicine, has the legal right to perform any surgical operation whatever, except, of course, operations of a criminal nature such as abortions and the like. But how many men, upon graduation from the medical schools and upon being licensed to practice, are competent immediately

*Read before the Geneva Academy of Medicine, at Geneva, N Y on January 10 1929

Ritter has reported the transmutation of syphilitic into tuberculous adenopathy Ricord evidently regarded this form of adenopathy as a true hybrid and some of his successors did not accept such a view, until Leloir in 1891 supplied a histological criterion for the existence of what he termed syphilotuberculides Koch's bacillus was found by biopsy and after a course of mercurial treatment a second biopsy showed a clinical picture of tuberculosis alone, although traces of another element were present in a secondary sclerosis After the discovery of the Wassermann reaction it became possible to study this hybridism further In 1922 Frei and Spitzer supplied a complete proof of it In scrofulotuberculous adenopathies they found the treponema, and while in the specimens studied they were unable to recognize the tubercle bacillus the guinea pig inoculation test was positive Seroreactions are not mentioned in this connection, but in certain cases studied by the present author both seroreactions were positive before treatment, while after the intensive treatment of syphilis the Wassermann became negative, the tuberculin reaction remaining strongly positive The first patient was an excellent one for study as he suffered from cervical adenopathy following chancre of the tonsil Other patients illustrated other types of this symbiosis As some of these patients were free from tuberculous antecedents we can only conclude that syphilitic infection sometimes mobilizes latent tubercle bacilli —*Schweizerische medizinische Wochenschrift,* December 18, 1928

Some Aspects of Dental Sepsis—Tallent Nuthall, writing in *The Lancet,* December 22, 1928 (ccxv, 5495), states that, when in the search for the source of infection the teeth are incriminated, the focus is believed to be completely eradicated by the extraction of those teeth Yet extractions are by no means a certain cure, many patients are no better and some are worse off than they were before The teeth in themselves are not necessarily the source of the trouble It is not the infection of one or more teeth that matters What does matter is the extension of the infective process into the neighboring structures, the periodontal membrane and alveolar bone So long as pyorrhea is confined to the superficial regions from which there is free drainage into the mouth, the effects on the system are likely to be those produced via the tonsils or gastroenteric tract When pyorrheal pockets involve the periodontal membranes the way is open for direct extension of the infective process The interpretation of dental roentgenograms is a matter of considerable difficulty There are few persons who do not show some degree of periodontitis, hence it is not possible to decide from the roentgenographic appearances alone what procedure must be undertaken to bring about a cure As it is the general clinical examination that brings the teeth under suspicion, so the final decision can be made only on the results of this examination The signs and symptoms must be evaluated and an attempt made to determine the degree of resistance and recuperative power, especially taking into consideration the amount of lassitude and mental depression The blood must be examined to find the degree of anemia and the proportion of polymorphonuclear leucocytes to lymphocytes Bacteriological and serolgical examinations should be made On the basis of these collated results and the roentgenographic findings a final decision must then be reached as to the extent of the mischief and the procedure required to eradicate it This decision must insure that no innocent teeth are sacrificed and that no infected tissue remains to continue the disease An immunizing course of vaccine therapy must always precede any operative measures, in order to avoid septicemia, septic pneumonia, or a flare up and extension of the infective process, and vaccine therapy will be required after the mouth has been dealt with

The Action of Vitamin D in Preventing the Spread and Promoting the Arrest of Caries in Children—May Mellanby and C Lee Pattison, writing in the *British Medical Journal,* December 15, 1928, ii 3545, review papers published in 1924 and 1926, in which they recorded investigations showing that the dietetic factors which control the structure of teeth in puppies also influence the initiation and spread of caries in children In these investigations there were many variations in the diets, such as the addition of cod-liver oil, egg yolk, extra milk, etc, while in the present study an attempt has been made to vary only one factor in the diet, namely, the vitamin D intake. The source of the vitamin used was irradiated ergosterol in the form of radiostol Of this, a group of 21 children, 5½ years of age, received 2 c c, some 1 c c and some 4 c c during a period of twenty-nine weeks The tabulated results show that the addition of vitamin D has a pronounced effect in (*a*) preventing the initiation of new carious foci, (*b*) limiting the spread of caries, and (*c*) apparently arresting the carious process in many cases A study of the process of arrest of dental caries shows that in the early stages the involved area, which is usually more or less soft, tends to harden, and may appear rough, later the irregularities are removed, probably mechanically, and the surface becomes harder and smoother, until finally it is firm, hard, polished, and pigmented The effect of vitamin D in adults was studied in only one case In this instance, after six months' treatment, the carious areas were definitely hardened and there was no increase in the size of the carious patches

methods in general use, if it injures the patient, will render him (the physician) liable, however good his intentions may have been"

There is another duty devolving upon the physician and surgeon which we should here consider The courts declare that it is "his duty to use reasonable care and diligence in the exercise of his skill and the application of his learning to accomplish the purpose for which he was employed He is under the further obligation to use his best judgment in exercising his skill and applying his knowledge The law holds him liable for an injury to his patient resulting from want of the requisite knowledge and skill, or the omission to exercise reasonable care, or the failure to use his best judgment" But the law is not too exacting It declares that the physician "does not guarantee a good result, but he promises by implication to use the skill and learning of the average physician, to exercise reasonable care and to exert his best judgment in the *effort* to bring about a good result." If the particular physician or surgeon possesses that degree of skill and learning ordinarily possessed by the average physician practicing in his locality, if he has kept abreast of the times and has not departed from approved methods in general use, if, in addition to all this, he has used his best judgment in applying his skill anl learning, even though a bad result ensues, the law does not hold him liable for it. It expressly declares "The rule requiring him to use his best judgment does not hold him liable for a mere error of judgment, provided he does what he thinks is best after careful examination" But this does not mean that the medical man or the surgeon is exempt from liability if he has departed from the approved methods in general use He has no right to employ his judgment in such a way as to lead him to such a departure What the law in this connection means is that where two or more methods might both be approved, he is not liable if he errs in his judgment in using one of those methods in preference to another in connection with a particular case

All of this may seem somewhat indefinite and vague Upon analysis, however, it will be found that it is not so The rules of law previously quoted were laid down by our New York Court of Appeals in the great leading case of Pike v Honsinger,[1] decided nearly thirty years ago, a case which has been referred to with approval by the courts of at least a majority of the states in the Union The great Judge who wrote that opinion understood the nature, the intricacies and the difficulties of medical practice He did not attempt to enunciate exactly what a doctor should do with a given patient in a given case, knowing that such a pronouncement would be impossible. What he did do was to lay down certain broad general concepts or rules of law They are rules which take into consideration the fact that the members of the medical profession alone understand what should or should not be done The members of the medical profession best know who is or who is not possessed of the requisite skill and learning The principles, therefore, which the law recognizes as governing the practice of the profession, are the rules which the medical profession itself lays down It is for this reason that in any action against a physician the question of whether or not the physician sued possesses the requisite skill and learning, and has or has not departed from the approved methods in general use, is a matter concerning which the jury is not permitted to speculate It is a question concerning which there must be expert testimony If there is a conflict between the experts, then an issue of fact for the jury arises as to which of the conflicting opinions it will accept But if there is no expert testimony at all (with certain exceptions) the mere fact that there has been a bad result does not establish either that the physician failed to possess the skill and learning which he ought to have possessed, or that he departed from the approved methods in general use

As was stated in the leading case of Robbins v Nathan,[2] "If the treatment of the defendant was unskillful or negligent, it was incumbent upon the plaintiff to show it by those qualified to testify to the proper method of performing such an operation, and if the untoward results present here might have been avoided by due care, the duty of showing that was also on the plaintiff" In the case of Lubbee v Hilgert,[3] the Appellate Division said that "the right of the plaintiff to recover must necessarily depend upon medical evidence, for the question is to what extent, if any, the failure of the defendants to properly treat the plaintiff aggravated the disease from which he was suffering or increased his pain or suffering *That question can be decided neither on the testimony of laymen nor by the jurors on their own knowledge and experience without testimony*"

One of the greatest pronouncements upon this subject was made by Chief Justice Taft when he was sitting in the United States Circuit Court for the Southern District of Ohio In the case of Ewing v Goode,[4] he declared "The naked facts that defendant performed an operation upon her eye, and that pain followed, and that subsequently the eye was in such bad condition that it had to be extracted, establish neither the neglect and unskillfulness of the treatment, nor the causal connection between it and the unfortunate event A physician is not a warrantor of cures If the maxim, res ipsa loquitur were applicable to a case like

to do surgery, particularly major surgery? Some may be, others doubtless are not In the thousand or more malpractice actions which I have personally handled or participated in handling, I have come upon many instances of surgical operations performed by men whose experience really did not justify them in embarking upon the operation in question,—an operation for the successful conduct of which the physician's professional brethren could not honestly certify that he was competent I have come upon instances of surgical operations which were entirely contraindicated by the history, the diagnosis or the condition of the patient I recall more than one operation of a delicate and unusual character where the particular physician had never before performed a similar operation, and where indeed he had done so without a thorough study of the medical treatises and literature upon the subject. Cases of this kind I have uniformly settled

What, then, is the question which the surgeon, especially the very young surgeon, should ask himself before operating? It is Do I possess that degree of learning and skill which is necessary properly to enable me to do this work? If he decides that he does, he must remember that by undertaking the operation he impliedly represents that he possesses, and the law places upon him "the duty of possessing, that reasonable degree of learning and skill that is ordinarily possessed by physicians and surgeons in the locality where he practices, and which is ordinarily regarded by those conversant with the employment as necessary to qualify him" to perform the operation in question. An analysis of this legal rule shows how fair and just the law is Except for the requirement that a surgeon must be duly licensed to practice medicine, it does not undertake to lay down any other rule of competency, except the rule acceptable to the profession itself The learning which the surgeon must possess is that *ordinarily possessed* by the physicians and surgeons in his locality and which is *ordinarily regarded by such physicians* as necessary to enable the surgeon to do his work Thus, in the last analysis, the standard set for any particular physician and surgeon is the standard set by the physicians and surgeons in the locality where he practices How high or how low this is depends upon the medical profession itself If in any locality the standard is low, the individual physician is legally obligated only to comply with that standard What the standard is, is within the hands of the medical profession of his locality

How fair the law is may be seen from a study of the further branches of this rule The Court of Appeals has said "The rule in relation to learning and skill does not require the surgeon to possess that extraordinary learning and skill which belong only to a few men of rare endowments, but such as is possessed by the average member of the medical profession in good standing" Thus the law does not set up an extreme measure of competency, but a very reasonable one It does not say that before a surgeon can operate he must be the greatest man in his profession, or even an outstanding character therein It merely declares that he must possess that learning and skill which the *average* member of the profession in his community possesses If, however, a man holds himself out as a specialist, he will be held to the standard of specialists rather than to that of the average practitioner I have singled out surgery here by way of illustration All that has been said applies, of course, equally to medicine

While the degree of learning and skill which the particular physician or surgeon (other than a specialist) must possess is only that which is ordinarily possessed by the physicians and surgeons of his locality, the law is more stringent as to the methods of treatment or the kind of operations which may be used The law does not attempt to define what is or is not a proper treatment or operation It does say, however, that the physician or surgeon "is bound to keep abreast of the times," and that "a departure from *approved methods in general use,* if it injures the patient, will render him liable, however good his intentions may have been" The methods which the practitioner employs must be the *"approved methods in general use,"*—not merely the methods in use by the practitioners of his locality—but the approved methods *in general use* The practitioner, therefore, must be acquainted with those approved methods To do so, he must be constantly alert to new discoveries and new methods This duty is laid down by the courts in the statement that "he is bound to keep abreast of the times" It is only by doing so that he may know, and may therefore be in a position to employ, "the approved methods in general use" at the time of his treatment or operation The law recognizes science as a progressive thing It changes from year to year, sometimes almost from month to month New discoveries are constantly being made The test-tube and the laboratory have not finished with their contributions to the cause of science It is not enough, therefore, for a physician to employ the approved methods which he was taught in medical school, but he must employ those methods which "are in general use" at the time when he renders his treatment or performs his operation

But at this point a note of warning should be uttered No physician or surgeon has the right to use his patient for experimental purposes He employs at his peril new methods which have not yet met the sanction of the medical profession In other words, he may not lag behind, nor may he (in his individual practice) go ahead of the times His obligation is to keep "abreast" of the times The law distinctly says that "a departure from approved

Second Be careful of your diagnosis Make sure before you arrive at a conclusion that you have ascertained, weighed and duly considered every relevant fact, including every detail of the history, and that you have considered the special systemic factors present in the particular patient Be sure to utilize every diagnostic aid which science has made available These would include *x*-ray, urine and blood tests, pathological and microscopical examinations If you have any honest doubt as to the correctness of your diagnosis after you have weighed and considered every possible fact which should be made a basis thereof, call in another physician for a confirmation of your diagnosis A differential diagnosis is ofttimes extremely difficult Sometimes the ablest physicians have diagnosed the condition of a woman as suffering from a tumor, and upon this diagnosis have operated, only to find that upon an examination of the uterus the woman is not suffering from a tumor, but is in fact pregnant. Sometimes a rigid examination of the patient as to her menstrual periods, the last date of intercourse, and, other questions will render such a faulty diagnosis improbable

Third In all questions of surgery, consider first whether in fact a surgical operation is required In case of doubt between a radical or a less radical course, consider carefully whether or not the less radical procedure is not the one first to employ In connection with surgical operations, consider carefully the kind of anaesthesia to be employed Some anaesthesias are proper in some instances, and improper in others Which one is proper depends upon a variety of circumstances, among which are the strength and age of the patient, the patient's heart and many other circumstances Be careful to inquire whether cocaine has been administered within a short time before the administration of the general anaesthesia Also inquire from the patient's history whether he or she has any idiosyncrasy for any particular form of anaesthetic In the administration of the anaesthesia, make sure that the anaesthetist is competent and understands his or her duties If possible, have a physician act as the anaesthetist rather than a nurse Make sure also that care has been employed in the matter of enemas, and in seeing to it (except in cases of emergency involving life or death) that the anaesthetic, if it is a general one, is not administered to a patient with food in the stomach Consider carefully whether or not a general or a local anaesthesia is the one of choice This may depend upon a variety of circumstances, including the condition of the patient, the nature of the operation, etc Before performing the operation, make sure that every antiseptic precaution has been taken according to the most approved methods This includes not only the sterility of the operator and of his instruments, but of all those who participate in the operation, such as the so-called sterile nurse, etc Then, too, in performing the operation make sure that a careful sponge count is made—that the number of sponges or packs placed within the body of the patient are counted, and the number which are removed are likewise counted, so as to be certain that no foreign body remains after the incision has been closed. Before calling for the sponge count make a careful personal inspection of the operative field to assure yourself that no foreign body is remaining, and put a record of this inspection on the hospital chart, have it done in the presence of the witnesses and have them sign the chart showing that this inspection has in fact been made

Fourth Keep careful records This applies not only to the records of the office, but to the records of the operation and of the treatment in the hospital It is wise in every case to have the patient consent in writing to the operation, which consent should contain a brief statement showing that he or she understands the nature of the operation, and the possible outcome Where a patient insists upon leaving the hospital against the doctor's advice, make sure that a statement is signed by the patient setting forth that fact Where one physician desires, or through circumstances beyond his control is forced, to relinquish a case to another physician, cause the patient to consent to this course in writing

Fifth Make sure that all your instruments and appliances are of the most approved design and make, and are in proper working order This applies not only to the operative instruments, but to the operating tables, chairs and all other appliances Especially is this true in connection with the use of surgical needles Make sure that the needles are secured from some well-recognized manufacturer, and that the needle employed is of a size and strength requisite to the particular demands which will be imposed upon it

Sixth In all treatments and all operations, make sure that the methods employed are the proper and approved methods in general use Do not use antiquated methods, nor employ new methods which have not yet received the sanction of the profession

Seventh Keep abreast of the times Read the medical journals and the new textbooks Keep your knowledge fresh and up-to-date Attend your County Medical meetings where you will hear papers read of great scientific value

Eighth Be conservative in your prognosis Unjustified promises have often led to disappointments, which in turn have resulted in mal-

this, and a failure to cure were held to be evidence, however slight, of negligence on the part of the physician or surgeon causing the bad result, few could be courageous enough to practice the healing art, for they would have to assume financial liability for nearly all the ills that flesh is heir to"

It would be impossible within the limits of one paper to set forth all the details and ramifications of the rules governing the practice of medicine The foregoing, it is believed, conveys a general outline of the subject, but before leaving this, there is one additional rule which should be noted, and that is that not only should the physician or surgeon possess the skill and competency previously set forth not only should he employ the approved methods in general use, but in addition he is required to give his patient "proper instructions" Thus, for example, in the case of fractures it is the duty of the surgeon to advise his patient as to when, how and in what way he should exercise and use, or fail to exercise and use, the injured limb I have had many cases arise by reason of the failure or the alleged failure of a physician to give such proper instructions But if a physician gives his patient proper instructions, and the patient does not obey them, the patient is then deemed guilty of contributory negligence and cannot recover against the physician

"All the obligation," said the court in one case, "is not upon the physician, but the patient also has duties to discharge In particular, the patient must obey the orders and follow the directions of the physician, and if he disobeys such orders or neglects such directions, he cannot hold the physician for the consequences of such disobedience or neglect"[5]

In every action for malpractice, the burden of proof rests upon the plaintiff The plaintiff's complaint should be dismissed unless he sustains that burden, and establishes by a fair preponderance of evidence that the physician sued has in fact been guilty of negligence This burden, as previously stated, cannot be sustained unless the plaintiff supplies expert testimony Properly to do justice to this question would require at least twice the space allotted to me in this paper I had occasion to write very fully upon that subject in a paper delivered by me before the Tri-State Conference in New York City on February 4th, 1928, and published in the NEW YORK STATE JOURNAL OF MEDICINE in the March 1st, 1928, issue You will there find my views set forth at length

I do not agree with those reformers who contend that expert testimony should no longer be required The makers of the common law ascertained from long experience the need for this type of evidence It is based upon the theory that there are many domains of knowledge not possessed by the average layman, and in which the ordinary juror would be incompetent to render a proper decision Hence, the law in its wisdom for many centuries has deemed it necessary that in such cases those especially acquainted with the particular technicality should be presented with a hypothetical state of facts, and upon that state of facts be permitted to express an opinion Once this opinion has been rendered, the jury is not bound by it, but may weigh and consider it as it does ordinary lay facts

Before a physician undertakes to become an expert witness against another doctor, he should make certain that he understands every fact in the case, that he has a complete and accurate knowledge of the history of the case, the nature of the symptoms, the character of the diagnosis, the treatment or operation prescribed, and all the other factors which would enable him to make an accurate diagnosis upon a patient of his own A thorough knowledge of these things will often dissuade an honorable physician from giving testimony against another doctor Those who have become experts, but have failed to study and grasp all of the facts involved, have sometimes made a sorry showing in their testimony Time and again I have fortunately been able to break down such experts, and to cause them to withdraw the opinion rendered in direct examination, by forcing them to consider proven facts in the case with the existence of which they had not been acquainted when they agreed to testify against a colleague

The innumerable principles of law which govern the practice of your profession, are in reality but refinements and amplifications of those already stated I cannot within the limits of this paper go into further detail It has seemed to me, however, that it might be helpful were I to here endeavor to enunciate certain rules which every physician should have in mind whenever he is called to treat a patient I suggest the following eleven

First Before consenting to treat or operate upon a patient, the physician should honestly inquire of himself whether or not he is in fact competent to treat or operate for the particular condition or ailment which he finds Medicine of late has become more and more specialized Men who are expert in one branch, may have had little or no experience in another Make sure that you are really competent to treat or operate for the particular condition which confronts you If you have any doubt upon this subject, call in one of your professional brethren who is expert in the particular subject involved, and see to it that he is employed as a consultant or that he actually renders the treatment or performs the operation in question

LONDON LETTER

THE MEDICO-LEGAL ASPECT OF FRACTURES

Two discussions which have taken place recently at medical societies in London have excited much interest They were as diverse as possible in their appeal, the one at the Medical Society of London on the "Medico-Legal Aspect of Fractures" raising points of serious importance to the Profession, the other on "The Doctor on the Stage" before the Hunterian Society, being mainly directed to emphasize the amusing ignorance of those who attempt to portray us on the stage There have been not a few cases of late where medical men, in spite of careful and often elaborate investigation, have had to defend in the Law Courts charges of malpraxis, and have in some cases been mulcted in heavy damages as compensation for disabilities resulting from fractures which they had treated Professor Hey Groves of Bristol opened the discussion by stating that the neck of the femur and the shoulder were the regions of the body most often leading to disputes and that in 90 per cent of cases the neglect of obtaining a real X-ray examination was the point upon which the case turned More than half the cases referred to fractures which had not been diagnosed, but there was a large group where obvious fractures, such as a Colles or Potts, had been diagnosed but some complicating injury had been overlooked He suggested that to protect the medical man from unjustifiable attack, amounting indeed to blackmail, the following methods might be adopted, though he realized that each has some difficulty in application

(1) That the patient or his guardian should sign an indemnity against any action taken because the result was unsatisfactory, (2) that the doctors on opposing sides should always confer together, and (3) that the Judge should have the assistance of an assessor, a medical man, as is the case in County Court. Dr James Neal (General Secretary, Medical Defense Union) maintained that an X-ray examination is essential even in cases where the fracture is clearly established by ordinary signs, and particularly that X-ray photographs should be taken during the convalescence to ensure that position is maintained He thought that a second opinion should be obtained in all doubtful cases In the discussion which followed, opinions were expressed that the public, quite unreasonably, expect to obtain an ideal result in all cases, and that in view of the difficulty of obtaining and interpreting X-ray photographs of fractures too much stress is laid on this aid to diagnosis, valuable as it is Professor Hey Groves' three suggested precautions received very little support

---

THE DOCTOR ON THE STAGE

The discussion on "The Doctor on the Stage" was made memorable by an eloquent tribute by Miss Lena Ashwell, the celebrated actress, to the part taken by the Stage during the War in lightening the load of the wounded in hospitals at the front and at home by concerts and plays Sir St Clair Thomson, who is not only an eminent laryngologist but also a renowned Shakespearean scholar, entertained the company by reference to the doctors mentioned in Shakespeare's plays, and drew attention to the fact that while in Shakespeare's early plays the doctor is lampooned, in his later plays the characters of the doctors are carefully and sympathetically drawn Mr Ivor Back, in a brilliant speech, amused the meeting by his account of the usual stage consulting-room, used as a right of way by all the characters, who often crowded the room even during a consultation On the few occasions when an actual operation was undertaken as in one of the Grand Guignol plays, lighting and asepsis seemed equally unimportant

Murder is so comparatively rare in England that the occurrence of a wave of tragedies all bearing some superficial resemblance to one another has aroused speculation The murders are nearly all of young women and the culprit is generally a young man apparently sincerely attached to her Imitative suicide is of course a commonplace, but imitative murder is a much more novel phase of mental disquiet which might well invite the close attention of the alienist.

By the time this letter has come into the hands of my American readers, I shall have returned from my third visit to the United States, and perhaps the March number might contain some of my impressions Meanwhile, my best wishes for the New Year

H W Carson, F R C S

practice actions Do not promise what you are not certain of delivering

Ninth One of the most productive sources of litigation is that of X-ray therapy and diathermy Do not attempt to do X-ray therapy or diathermy unless you understand it A physician who merely purchases an X-ray machine and follows the instructions of the salesman or of the circular of the manufacturer, is indeed assuming a large hazard X-ray therapy is a highly technical specialty New discoveries and new theories are constantly evolved The proper factors of dosage and other factors require a knowledge of the best and most recent thought upon the subject In determining the factors, make sure that you have made a correct computation, and that you are using the proper factors generally recognized as such at the time the therapy is administered Inquire carefully to determine whether or not the patient has had a previous exposure of X-ray within a time that would render it unsafe for you to subject him or her to a new exposure Make sure that your machine is in proper working order, and that there are no loose wires with which the patient or the friend or parent accompanying the patient, may come in contact Many actions have arisen in this way In administering this therapy, make sure that the proper intervals between doses are maintained

Tenth Be tactful and just to your fellow practitioners Do not indulge in needless criticism Careless remarks, ofttimes unjust, have led to litigation

Eleventh In treating your patient or your patient's family, exercise the highest possible degree of care and good faith Be scrupulously honest in your advice and in your treatment Do not give your patient any basis for the claim that you have been guilty of abandonment If you cannot continue with the treatment, make sure that you have supplied a successor physician of talents equal to your own, and that the patient consents to this substitution In every dealing with a patient or with the patient's family, if you are certain of your diagnosis and if you have considered and mastered every technical question of medicine or surgery which may be involved, let your conscience be your guide Establish a reputation for good faith and fair dealing at all times with everyone

I do not mean in this paper unduly to stress the importance or the dangers of surgery The general practitioner bears the same responsibility and is required to exercise the same amount of care, foresight, skill and knowledge as the surgeon A large number of our malpractice actions have been brought against the general practitioner

No doubt, the foregoing rules might be amplified, but from my observation in the handling of approximately one thousand malpractice actions I believe that if each and all of the foregoing rules had been complied with, a large number of the cases which I have had to defend would not have been brought at all The practice of medicine is an extra-hazardous one This should be recognized at the outset. The doctor has great obstacles to overcome Many opportunities for observation have increased my sympathy with and my understanding of the problems which confront the medical profession The foregoing rules which I have endeavored to enunciate are based upon a long and wide experience They are not stated in any spirit of criticism of your profession, but rather insofar as they may be helpful, as a guide

Yours is a great profession There is none greater You may justly be proud of your great calling When the whole number of practitioners is considered, those who fall below the highest standards are few in number Thousands of successful operations and treatments, however, are unheralded and unsung, but a careless operation or an improper treatment is widely advertised, doing injury not only to the particular physician, but the whole profession

is manifested by similar organizations at Fort Plain, Fonda and Canajoharie.

Physicians In a survey of Public Health work it is apparent that none of these agencies thus far mentioned, can accomplish much in this particular field without the aid of the physicians If they initiate any movement in sanitation, the doctor may be relied upon to help carry on, in an official or private capacity In these widely diverse endeavors, the Medical profession is the common bond of union None other can act so intelligently to coördinate the various enterprises relating to the Health of the Community Therefore, the building up of a strong Committee on Public Relations is at once apparent

Organization There are 50 physicians in Montgomery County In the progress of the past twenty years, they have played their part well, but now the time has come for more concentrated effort, more cooperation with other county societies, more vigorous support of the policies of the State Medical Society In other words, there should be organization, and administration to coordinate these various citizen movements toward better personal health and public sanitation

The Future Progress is destined to continue The question is, will it proceed along commercial lines, the physicians playing the part of laggards, or shall the movement be directed by those whose "professional training specially qualifies them to render this service."

Committee on Public Relations Charles Stover, M D, *Chairman* Horace M Hicks, M D, R. R Canna, M D, E H Ormsby, M D

SCIENTIFIC MEETING OF THE STATE SOCIETY

The next meeting of the scientific sections of the Medical Society of the State of New York will be held in Utica, June 4th, 5th and 6th

The first session will be devoted to the discussion of some general medical problems presented by recognized experts The details of these papers will be published in this column in the near future This will be a meeting for the entire Society and will start at 2 00 p m on Tuesday, June 5th

The Wednesday, June 6th, afternoon session will be devoted to the elucidation of some surgical and obstetrical problems vitally affecting the interest of every practitioner in the state

Each essayist will be an authority on his subject and capable of presenting well correlated facts in an assimilable manner

The local committee has provided a spacious, well-ventilated, quiet hall, and expects to have comfortable chairs for the large audience which will greet the well-known speakers

It is to be remembered that there will be no special section meetings either Tuesday or Wednesday afternoon, for the entire membership will gather in the one meeting place on those afternoons

On Wednesday and Thursday mornings the Society will be divided into sections where papers of special interest will be read and time allowed for thorough discussion of the views expressed by the authors

The chairmen of these sections guarantee that the work will be broad and the subjects of active clinical interest.

For the information of the members of the Society, the personnel of the Committee on Scientific Work is added to this preliminary notice

SECTION OFFICERS

Medicine

Chairman—John A. Lichty, M D	Clifton Springs
Secretary—A. H Aaron, M D	Buffalo

Surgery

Chairman—Hyzer W Jones, M.D	Utica
Secretary—William D Johnson, M D	Batavia

Obstetrics and Gynecology

Chairman—Gordon Gibson, M.D	Brooklyn
Secretary—George M Gelser, M D	Rochester

Pediatrics

Chairman—Carl G Leo-Wolf, M.D	Niagara Falls
Vice-Chairman—John Aikman, M D	Rochester
Secretary—Marshall C Pease, M D	New York

Eye, Ear, Nose and Throat

Chairman—Harry M. Weed, M D	Buffalo
Secretary—Edwin S Ingersoll, M D	Rochester

Public Health, Hygiene and Sanitation

Chairman—Leo F Schiff, M.D	Plattsburg
Secretary—William L Munson, M.D	Granville

Neurology and Psychiatry

Chairman—David C. Wilson, M D	Clifton Springs
Secretary—James H Huddleson	New York

Dermatology and Syphilology

Chairman—Jerome Kingsbury, M D	New York
Secretary—Louis Tulipan, M D	New York

Industrial Medicine

Chairman—Benjamin J Slater, M.D	Rochester
Secretary—M Webster Stofer, M D	Norwich

A room has been provided for the exhibition of charts, drawings and specimens It is to be hoped that all papers will be illustrated by the use of lantern slides whenever feasible

Attention is drawn to the fact that there are two prize funds, the Lucien Howe and Merritt H Cash In the next issue of this JOURNAL details will be published as to the method of entering the work in these prize competitions

ARTHUR J BEDELL,
Chairman, Committee on Scientific Work

NEWS NOTES

PUBLIC RELATIONS COUNTY SURVEY, NO 3—MONTGOMERY

Board of Supervisors This is composed of eighteen members, eight of whom represent the City of Amsterdam A little more than one-half of the county population is in the city There are standing committees of six members each on Laboratory, Sanatorium, and Child Welfare

Laboratories and Hospitals There is at present before the Board of Supervisors a proposition to erect a fire-proof modern building of 75 beds at a cost of $250,000 to replace the present Tuberculosis Sanitarium, outgrown and out of date When the County Laboratory was instituted and the Committee from the County Medical Society brought up the subject of a schedule of fees, one of the Supervisors said, "If you are really going to give the people something, why not make the service free"—and so it was started and has remained A contract was made with the Board of Directors of the Amsterdam City Hospital and its Wasserman Memorial Laboratory to provide quarters, light, gas and water Since then the Supervisors have granted more funds and branch laboratories are maintained at St Mary's Hospital and the County Sanatorium The staff includes full time pathologist, four technicians, part time stenographer and two assistants The budget for 1929 is $19,000, with rebate by the State

By this cooperation, Clinical work is provided for in the St Mary's Hospital and the City Hospitals There are about 150 beds in the two hospitals In the sanatorium with an official capacity of 42 there are now 67 of which 22 are in the Preventorium

Boards of Health There are ten part-time health officers in the County of Montgomery The city of Amsterdam has a health center, at the City building, where clinics in child welfare and venereal diseases are conducted

Pretuberculosis A City Dispensary has for many years been carried on in charge of one physician Here are gathered and kept under observation, the pre-tubercular children Last year 100 cases made 700 visits The tuberculosis nurse of the Department of Health is in close association with the physician in charge of this department The children cared for in the Summer camps and belonging to the city come in through this agency, those from the country come from the schools and clinics supervised and selected by the Executive Secretary of the County Committee on Tuberculosis and Public Health She is in close touch with the school nurses over the County As stated previously the Preventorium provides for another group of undernourished children selected by the Superintendent of the County Sanitarium At the present time they number 22

School Health Supervision School health supervision is carried on within the County of Montgomery by both full-time and part-time physicians all of whom are practitioners within the county There are a number of full time school nurses employed who are designated as School Health Teachers when sufficient requirements have been obtained in the way of post-graduate work to entitle them to this certificate granted by the State Board of Regents The city of Amsterdam alone expends $25,000 per annum for the purpose of School Health Supervision

Public Health Nurses In addition to the School nurses employed as a rule in the City and County Schools, there are five Public Health Nurses employed in three of the industrial plants of the County, and four in the Department of Health of the City of Amsterdam, the Community Nursing Service employ three nurses who have taken over the nursing work of the insurance companies

Red Cross The Montgomery County Red Cross steadily cares for the veterans of the American Legion, extending aid in nursing, surgical operations, and various other services, not otherwise provided for

State Charities Aid Association and County Committee Among lay organizations, The County Committee on Tuberculosis and Public Health of the State Charities Aid Association has been very active during the last eighteen years It is financed by about six thousand dollars annually, the result of the Christmas Seal Sale From this amount are paid the salary of an Executive Secretary, the costs of a summer camp for undernourished children, assistance in organizing clinics, lectures, circulating literature, a booth at the County Fair, and whatever opportunities are presented for cooperation with other agencies

Luncheon Clubs The Kiwanis and Rotary Clubs are always cordial workers in Public Health Affairs and favorably mold public opinion

Commercial Organizations The Chamber of Commerce in Amsterdam has its Committee on Public Health and can be reckoned on to support every sound welfare movement The same spirit

* Read at the meeting of the Medical Society of the County of Montgomery January 24 1929, Wm. G Pierce, M D Secretary

OBSTETRICAL FILMS FOR LECTURE PURPOSES

The Committee on Public Health and Medical Education of the Medical Society of the State of New York has approved the two moving picture films on Obstetrics prepared for lecture purposes by Dr Paige E Thornhill of Watertown

The first film, entitled, "Prenatal Care," is about 400 feet long and requires 20 minutes to run It shows the examination of the patient upon her first office visit, including the detail of pelvic measurements It also shows the method of diagnosing position and presentation at the ninth month

The second film is about 800 feet in length and requires 35 minutes to run. The picture, "A Normal Delivery in a Home," shows how, with a sterile bundle and a little care, one can secure fair surgical technic with no trained assistance It emphasizes the use of sterile bundles in home deliveries

These films were shown before the Obstetrical Section at the last State Society meeting Doctor Thornhill has been fortunate in having the films reviewed by several prominent teachers of obstetrics and has profited by their criticism and advice

The films are available to any county society or lecturer, to whom they will be loaned by Doctor Thornhill without cost except the expense of transportation and insurance, and of course an agreement for their prompt return

---

LEGISLATIVE BULLETIN NO 1—JANUARY 22, 1929

The new legislative season has made an auspicious beginning Certain of the bills which we have annually opposed are already on the docket for this year, namely, the anti-vivisection bill, introduced again by Mr Vaughan, Assembly Int No 166, and the compulsory health insurance bill, by Mr Cuvillier—Assembly Int No 41—identical with the bill which he has presented annually for the last five or six years

Old age insurance promises to be an interesting subject this year and quite likely the legislature will do something about it, either appoint a commission to study the matter and submit a bill to the 1930 legislature, or enact one of the several bills that have been introduced this year None of them, however, carries any medical clause, except Mr Cuvillier's The following bills have already been introduced

Old Age Assistance

Senate Int. No 41—Antin, creates temporary state commission to study old age pensions

Senate Int. No 110—Love—concurrent Assembly Int No 12—Miller, outlines a law as an amendment to the Poor Law, providing for assistance to aged poor persons and creating an old age assistance commission

Senate Int. No 150—Mastick—concurrent Assembly Int. No 273—Goodrich, is a similar bill, but instead of creating a commission, it authorizes the establishment of a bureau of old age assistance under the State Charities Law

Senate Int No 225—Wicks—concurrent Assembly Int. No 264—Bernhardt, adds a new article, No 20, to the State Charities Law, establishing a bureau of old age welfare and appropriates $500,000 for its administration

Hospital Records

Senate Int No 87—Burkhard—concurrent Assembly Int No 186—Gallagher, offers to amend section 412 of the Civil Practice Act, providing a subpoena duces tecum requiring production of hospital records, must be served *at least five days before day fixed for production thereof* This is an important amendment, allowing the hospital a period of five days in which to prepare and submit its records when they are demanded by the court

Sanitation

Senate Int. No 5—Freiberg—concurrent Assembly Int. No 210—Swartz, reintroduces amendments that were before the legislature for the last several years, prohibiting the discharge of sewage into waters of the state, including streams, springs and bodies of surface and ground water, so as to create a menace to health or become a public nuisance

Vacation Camps

Senate Int No 39—Buckley—concurrent Assembly Int. No 65—Streit, adds new article to the General Municipal Law, authorizing child welfare boards to establish vacation camps for children between the ages of ten and fourteen, during the summer months of June, July and August The camps are to be fully equipped with everything required to shelter, feed, entertain and care for the children and placed in charge of a competent manager or matron Children are to be admitted through request made by the parents to the board, which may then, in its discretion, issue an invitation to such child or children to become its guest at the camp for a period not exceeding two weeks in any one year, at such rate

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

A meeting of the Committee on Public Health and Medical Education of the Medical Society of the State of New York was held in the rooms of the Society, 2 East 103rd Street, on December 20, 1928 Those present were Dr Farmer, Chairman, and Drs Kosmak, Groat, Longstreet, Bayne-Jones, and Greene, and Dr J S Lawrence, Executive Officer

The committee reviewed the report of the Chairman which was submitted to the Council on December 13, 1928, a copy of which had previously been sent to each member of the committee, as also summaries for all the courses given since September 1, 1927 It also considered and approved the requests of county societies for courses during the spring of 1929 and the plans for these courses

Doctor Kosmak proposed as an additional course to be offered by the committee one which would deal with the methods of making periodic health examinations This proposal was unanimously accepted by the committee Doctor Kosmak suggested that Doctor Otto H Leber might be asked to outline such a course This suggestion was also unanimously accepted

Doctor Bayne-Jones was asked to secure the aid of Doctor McCann in arranging a course on Diseases of the Blood for Clinton County

There was a general discussion of the possibility of the extension of the Sheppard-Towner Act by new legislation, and it was unanimously decided that the Legislative Committee of the State Society be informed that the Committee on Public Health and Medical Education is of the opinion that all future work in post-graduate medical education to County Medical Societies in the subjects of Obstetrics and Pediatrics should be under the direction of and financed by this committee

The committee disapproved the plan of manufacturers of Physiotherapy apparatus giving post-graduate courses in this subject, and recommended to the Executive Committee of the State Society that the Executive Committee protest to the Council of Physical Therapy of the American Medical Association against the acceptance by the Journal of the American Medical Association of advertisements offered by such companies

The surveys of illness conducted in counties by official agencies without the approval of the county medical society, was disapproved It was suggested that the Chairman of the committee confer with the Chairman of the Committee on Public Relations regarding the matter The Committee considered in a general way the public dissemination of medical knowledge

The Chairman was authorized to prepare a statement for the NEW YORK STATE JOURNAL OF MEDICINE regarding the availability of films prepared by Doctor Paige Thornhill of Watertown, New York, on obstetrical subjects for lecture purposes

It was decided that the Committee should have another meeting before the annual meeting of the House of Delegates, at which time the following subjects would be considered 1 Diphtheria Immunization, 2 Health Surveys by County Medical Societies, 3 Periodic Physical Examinations, and 4, other Public Health activities for which the County Medical Society is entirely responsible

THOMAS P FARMER, *Chairman*

POST GRADUATE COURSE ON PERIODIC HEALTH EXAMINATIONS

Dr Otto H Leber, chairman of the Special Committee on Periodical Examinations of the Medical Society of the County of New York, has submitted the following outline

Lecture 1—The Relationship of the Periodic Health Examination to the Modern Practice of Medicine This lecture is to include the following What is a health examination, what it should include. What its functions The difference between it and the regular work of the physician Does it pay him to do it Relation of specialist to the periodic health examination Lecturer, Dr Otto H Leber

Lecture 2—A health examination demonstration with Motion Picture Lecturers Dr Charles J Dillon, and another

Lecture 3—The Periodic Health Examination in Children, with reference to the infant, the preschool child, and the school child Lecturers Dr William St Lawrence, and another

Lecture 4—The Prescription, follow-up, and diet for different kinds of clients The school child, the woman, the business man and the farmer, with special reference to a selected three of the foregoing classes Lecturer Dr Ward Crampton

The Committee on Public Health and Medical Education of the State Society will be glad to arrange to have this course given for any County Medical Society which desires it. It is the opinion of the Committee that this course will be of decided benefit both to the profession and the public in general

Compensation for Motor Injuries

Senate Int No 220—Sheridan, Assembly Int No 295—Bloch, creates temporary commission to investigate subject of compensation for injuries from motor vehicle accidents

Senate Int. No 261—Webb, Assembly Int No 467—Lattin, amends Lien Law by providing for lien of hospital for treatment in accident cases This bill was prepared and introduced by the Department of Hospitals of the State Board of Charities, at the request of quite a number of hospitals in different parts of the state It provides that the hospital shall have lien for the amount of its reasonable charges upon any insurance or other fund or benefit which may be paid on account of the accident either to the injured person or to his guardian, if he be a minor It requires that the person who brings the accidentally injured person to the hospital shall disclose to the hospital authorities the name of the injured person, as well as the name of the person or corporation causing the injury, if he possesses that knowledge

Sterilization

Senate Int No 289—Brown, Assembly Int No 338—Dominick, provides for the sexual sterilization of insane, idiotic, imbecilic, epileptic and feeble-minded inmates of institutions supported wholly or in part by public funds Mr Dominick has reintroduced his bill of last year with slight amendments It provides for the appointment of a special board composed of one institutional medical superintendent, other than the superintendent in charge of the patient, a medical representative of the Department of Mental Hygiene, and a representative of the medical profession who is not a state employee Every petition for sterilization must be passed upon by this board

Nurse Employment Agencies

Assembly Int No 416—Lattin, amends section 170, General Business Law, by providing provisions for licensing employment agencies shall not apply to incorporated alumnae associations of registered nurses This amendment was requested so as to exempt certain nurse alumnae association homes closely affiliated with nearby established hospitals from being confused with commercial employment agencies

Hearings

Assembly Int No 35—Remer, amends Penal Law by permitting use of instruments for contraceptive treatment of married persons, when applied by physicians A hearing is announced on this bill for February 19th, 2 00 p m, before the Assembly Committee on Codes

Assembly Int No 77—Cuvillier, amends the Penal Law, making it a felony punishable by imprisonment for from five to ten years, to sell poisonous beverages A hearing will be held on this bill on February 12th, at 2 00 p m, before the Assembly Committee on Codes

Henry L K Shaw,
Harry Aranow,
Garrett W Timmers,
Committee on Legislation,
Medical Society of the State of New York

LEGISLATIVE BULLETIN NO 3—JANUARY 31, 1929

The Committee, as in former years, is very eager to have comments from the chairmen with regard to the attitude of the physicians in their societies upon the bills as they are announced We have always had very excellent cooperation from some of the counties This morning we had a statement from the Committee of the New York County Society, making some comment upon every bill thus far reported Their comment in many instances was limited to a word of approval or disinterest, and when disapproval was mentioned, a brief explanation was given of the grounds for their action It would not require much time of every Committee to take similar action about once a week and report to us It would help your State Committee enormously

The following bills have been introduced since the last bulletin was prepared

Sanitation

Senate Int No 407—Pitcher, Assembly Int. No 626—Lattin, authorizes establishment of sewer rents in any village which has a sewer system

Senate Int. No 408—Pitcher, Assembly Int. No 623—Lattin, relative to orders by health commissioner to protect water supplies, by striking out the word "emergency"

Senate Int No 409—Pitcher, Assembly Int No 621—Lattin, requires approval by State Health Department of all plans for installing or altering water purification plants

Senate Int No 410—Pitcher, Assembly Int. No 622—Lattin, authorizes establishment of sewer rents in cities

Senate Int. No 413—Pitcher, Assembly Int No 624—Lattin, provides penalty for discharge

as the board may prescribe Invitations can be issued only to children whose parents have resided in the district over which the board has jurisdiction for a period of two years immediately preceding The board, may, in preference to establishing its own camp, pay for the maintenance of any child or children in a camp of some other district, or in any privately owned or conducted camp which it has approved after inspection

Habit Forming Drugs

Senate Int No 111—Love, provides as follows "Whoever in violation of law or except upon written direction of a duly licensed physician furnishes, supplies or administers either for or without consideration any drug, medicine or chemical preparation, the use of which by said person tends to result in or produce a habit in such person dangerous or deleterious to the health, reason or mode of conduct of such person, shall be responsible in the three-fold damages to any person injured thereby"

Senate Int No 112—Love, amends the Public Health Law in relation to habit forming drugs, by defining a drug addict as one who habitually or unnecessarily takes or otherwise uses opium, morphine, cocaine, or other habit forming drugs, except when such taking or use is lawfully prescribed by a physician in the course of his professional practice, also makes it unlawful for a drug addict to possess any habit forming drug, except it be lawfully proscribed by a physician, also provides for the special marking of all bottles or containers holding habit forming drugs and the repossession by physician of all drugs prescribed but not used He has added to the penalties that the first violation shall be a misdemeanor and subsequent violation a felony Any violator or any provision of the law is to be examined before sentence and, if found to be an addict, he is to be sentenced to imprisonment for the maximum term and not discharged nor paroled until declared cured of his addiction by the medical authorities of the institution Drug addicts, while imprisoned, shall be segregated in a separate part of the institution

Senate Int. No 113—Love, amends section 242, Penal Law, by making it assault, second degree, to unlawfully administer or cause to be administered to or taken by another, poison or any drug or medicine dangerous to life or health whether or not there is an intent to injure

* * * *

In previous years, during the legislative season, the Committee has employed an extra assistant in the Albany office to help issue the bulletins and supply county chairmen with copies of bills, but this year the appropriation for extra clerical service was not allowed and we will, therefore, be unable to do as much for the chairmen as we have been accustomed to do We shall not send to every chairman copies of the bills as they are issued, but will be glad to send any particular bills to any person who may request them We shall continue the issuance of bulletins in order that we may keep every chairman promptly and accurately informed as to the introduction and progress of bills having a relation to the practice of medicine

Henry L K. Shaw,
Harry Aranow,
Garrett W Timmers,

Committee on Legislation, Medical Society of the State of New York

---

LEGISLATIVE BULLETIN NO 2—JANUARY 26, 1929

Compensation

For the last several years bills have regularly been introduced in both houses, adding to the list of occupational diseases for which compensation is payable, all disabling diseases and disabling illnesses This same bill has already been introduced this year three times in the Assembly and once in the Senate, as follows Senate No 4—Love, Assembly No 52—Esquirol, Assembly No 392—Coughlin, Assembly No 487—Nugent

Senate Int No 182—Fearon, amends sub-division 2, section 3, of the Workmen's Compensation Law, by classifying as occupational diseases to be compensated for, injuries from radium, radium emanations, or *X*-ray, and any process involving the use of radium, radium emanations or *X-ray*, in hospitals or laboratories This bill was introduced at the request of the Department of Hospitals in the State Board of Charities

Assembly Int No 389—Cantor, reintroduces a bill of last year which amends section 13 of the Workmen's Compensation Law, by striking out provision that claim for medical treatment shall be void as against employer unless physician within twenty days after first treatment furnishes a report of injury and treatment

Ambulance Chasing

Senate Int No 281—Sheridan, Assembly Int No 364—Moran, amends Education Law relative to practice of medicine, by requiring physician to certify that he has never solicited or advised patients while attending a hospital, to retain an attorney for purpose of prosecuting claim for personal injuries, and making other provisions

ished children or those threatened with tuberculosis

Workmen's Compensation

Senate Int No 182—Fearon, reported in bulletin No 2, has been introduced in the Assembly, Int No 628, by C P Miller This bill classifies as occupational diseases to be compensated for, injuries from radium, radium emanations or x-ray

Assembly Int. No 536—C P Miller, reported in bulletin No 3, has been introduced in the Senate, Int No 524, by Mr Gates This bill provides compensation for employees disabled because of silicosis

The bill in which we were so vitally interested last year, which provided for the creation of an advisory medical council in the industrial board, we are reliably informed is being redrafted with provision for compensating members of the council for services they may render, and will be reintroduced at an early date

Education

Senate Int No 512—Webb, provides that there shall be a board for each profession named in law, of three or more members appointed by regents from the state at large. This bill would supersede all regulations contained in the separate professional laws with regard to the appointment of examining boards and the manner of rating papers, by providing a uniform scheme to obtain with all It automatically legislates out of office all of the present members of the examining boards, but does not prevent their being reappointed under the new regulations The object of the regents in promoting the legislation is to secure uniformity of procedure in all examinations for professional licensure

Sanitation

Senate Int. No 438—Freiberg, Assembly Int No 660—Swartz, empowers state health commissioner to administer and enforce all laws relating to pollution of waters, and appropriates $100,000 00

Narcotics

Senate Int No 111—Love, reported in bulletin No 1, has been introduced in the Assembly—Int No 710—by Mr Esquirol This bill provides a three-fold damage for injuries caused by the unlawful furnishing, supplying or administering of dangerous drugs or medicine

Progress

Senate Int No 87—Burkard, reported in bulletin No 1, allowing five days for the production of hospital records upon court request, has been amended to read *two* days instead of five. Such amendment is under consideration by the Committee on Codes, with which the bill rests in the Assembly

Hearings

February 12th—2 P M —Assembly Int. No 166—Vaughan, anti-vivisection bill. Assembly Committee on Codes

February 12th—2 P M —Assembly Int No 77 —Cuvilier, poisonous beverages Assembly Committee on Codes

February 19th—2 P M —Assembly Int. No 35 —Remer, birth control bill Assembly Committee on Codes

THE LAW ON CONTRACEPTIVE ADVICE

Every physician in New York State is confronted with apparently contradictory statutes in regard to his giving contraceptive advice The Medical Practice Act of 1926, Section 174e, forbids him to give that advice, while the Penal Law of 1881, Section 1145, permits him by implication to give such advice *"for the cure or prevention of disease"* An amendment to Section 1145 of the Penal Law has been introduced in the Assembly (Introductory Bill No 35), in order to clarify the law and correct its contradictory provisions

Section 174 of the Medical Practice Act of 1926 reads as follows

"2 The license of a practitioner of medicine may be revoked, suspended or annulled or such practitioner reprimanded or disciplined in accordance with the provisions and procedure of this act in any of the following cases "

"(e) That a physician did undertake or engage in any manner or by any ways or means whatsoever to procure or to perform any criminal abortion and/or to violate section eleven hundred and forty-two of the penal law"

Section 1142 of the Penal Law, which was enacted in 1873, reads

"A person who sells, lends, gives away, or in any manner exhibits or offers to sell, lend or give away, or has in his possession with intent to sell, lend or give away,

of sewage from any public sewer system into waters of the state without a permit

Assembly Int No 618—Kahan, empowers the Department of Health to supervise public summer camps and cottages, to enforce health council regulations and sanitary code

Health Officers

Senate Int No 402—Pitcher, Assembly Int. No 596—Lattin, exempts health officers from duty of examining school children

Senate Int No 411—Pitcher, Assembly Int. No 625—Lattin, providing that when Commissioner of Health appoints a health officer, he shall be qualified as "provided by regulation of public health council"

Child Welfare

Senate Int No 332—Antin, provides for child welfare allowance in case mother becomes incapacitated

Senate Int No 370—Webb, Assembly Int No 544—Rice, amends the Education Law relative to children with retarded mental development

Assembly Int No 583—Carlin, provides for continuing child welfare allowance to widowed mother while confined in a hospital

Narcotics

Senate Int No 399—Love, Assembly Int. No 435—Story, makes penalty for having narcotics in possession imprisonment for not less than five nor more than ten years, instead of not more than ten years as at present

Assembly Int No 566—Dickey, makes it a felony to sell or distribute habit forming drugs, imprisonment not to exceed ten years

Workmen's Compensation

Assembly Int No 536—C P Miller, provides compensation for employees disabled because of silicosis

Dancing Contest

Senate Int No 324—Hofstadter, Assembly Int No 501—Moffat, prohibits dancing contests where contestant continues in contest longer than twelve hours during any twenty-four

LEGISLATIVE BULLETIN NO 4—FEBRUARY 6, 1929

The following bills have been introduced since issuance of the last bulletin

Public Health

Senate Int. No 466—Pitcher, Assembly Int. No 679—Lattin, making compulsory vaccination law apply to any city of 50,000 or more inhabitants, instead of cities of first and second class, and modifying the report of vaccination to be submitted by the physician by requiring that the address of the person vaccinated be given and not the name and address of parents in the event that such person is a minor, and requiring a description of "the type of reaction found" upon re-examination.

Senate Int No 467—Pitcher, Assembly Int. No 680—Lattin, requires that whenever rabies shall exist among dogs, it shall be unlawful for any person owning, boarding, or otherwise keeping a dog, within the general health district, consolidated health district, city, village or town, "to permit such dog to be at large or to be on leash elsewhere than on the premises of the owner, except it be on the premises of another person with the knowledge and assent of such other person, unless muzzled with a properly fitting muzzle

" Violation of this provision is to be considered a misdemeanor and subject to a fine of not to exceed $25 00 for the first offense and not less than $25 00 nor more than $50 00 for each subsequent offense, or by imprisonment in the county jail for not to exceed 25 days During such period any duly appointed dog warden or any peace officer shall, and any other person may, seize and confine or kill any dog found unmuzzled in violation of this section, and the person doing so shall immediately report in writing the facts relating thereto, to the health officer Such person shall not be held liable for damages if the facts are properly reported to the health officer, who will in turn forward the report to the State Department of Health

Senate Int. No 522—Westall, authorizes the supervisors to appropriate money for maintaining an incorporated society or organization operating a preventorium or health camp for undernour-

tion, such as the support of a legislative bill, should take a vote on the attitude of the society, and that after the vote had been taken, the minority should support the majority, or at least refrain from expressing an opinion contrary to that of the majority However, the doctor did not suggest any means of disciplining a minority who opposed the will of the majority

3 Fee splitting was next discussed by Dr Reik, who said that a Grievance Committee, modelled after that of New York State, could handle the problem

4 Popular Medical Education was the fourth subject discussed Dr Reik described the work of the field secretary of New Jersey, Mrs Taneyhill, in lecturing to women civic organizations throughout the state, principally under the auspices of the women's auxiliary

5 Newspaper advertisements of quack remedies was next discussed Dr Reik described some correspondence which he had conducted with the New York *Times* regarding influenza advertisements, and said that the Editor had expressed a willingness to discuss the subject with a representative of the Medical Society of the State of New York

Dr Thomas G Simonton, President of the Medical Society of the State of Pennsylvania, said that one Philadelphia newspaper had received $30,000 00 from influenza advertisements in one month

Dr James N Vander Veer told of his experiences with the Albany newspapers and said that at first they refused to reject quack advertisements on the ground of existing contracts, but that in the course of three or four years the doctors had influenced the editors to throw out nearly all the objectionable advertisements

Dr J B Morrison, Secretary of the New Jersey State Medical Society, spoke of the exhibits at the State Society meeting, and said that the standards of the Council on Pharmacy and Chemistry of the A M A. was the standards on which the exhibits were accepted

6 The sixth and last topic discussed by Dr Reik was the relation of doctors to lay health organizations He urged that members of county societies should act from a sense of civic duty and assume the leadership in health matters which are now preempted by the lay organizations

Dr E K. Mulford, President of the New Jersey State Society, suggested that county societies shuld seek to place dcotors on the Board of every lay organization that takes part in health work

7 The seventh topic,—"The value of the personal influence of the officers of the State Society over individual leaders in the county societies,"—was introduced by Dr James E Sadler, who described his experiences with two societies to which he had made official visits, and urged the adoption of certain activities, without response from the societies A year later, he had visited the societies and did not make an address, but in its place he sat down with two or three leaders and induced them to enter into the work with enthusiasm

Dr Morrison described the good results which had followed the visits of the State Officers to every one of the twenty-one county societies of New Jersey, and the rehabilitation of all those which were almost inactive

Dr Harry Walter Albertson, past-president of the Medical Society of the State of Pennsylvania, spoke of the good results which had followed the visits of the representatives of the State Department of Health to the ten counties in which midwives were licensed to practice

8 Dr Simonton introduced the eighth subject,—that of Workmen's Compensation He described an informal discussion on a railroad train when three members of the State Compensation Commission told three representatives of the State Medical Society that the Commission had numerous records of reprehensible cupidity on the part of doctors, and suggested that the doctors clean house, and set their own internal affairs in order before they came to the Compensation Commission

Dr Donaldson said that medical house cleaning was a harsh term to apply to doctors, and suggested the substitution of the words "Economic introspection"

Dr Vander Veer told of his experience before a Compensation Board, in which he had charged $3 00 per visit on an injured man, and the Chairman of the Board had ordered the price cut to $2 00 Dr Vander Veer replied, "I have just finished a survey of my office work during the past year, and have found that my overhead expenses average $1 48 for every visit of every case that comes to my office for treatment." The Judge replied, "That is the first direct evidence I have ever heard of what it costs a doctor to treat a patient The bill is approved as submitted"

Dr Vander Veer went on to emphasize the need of accuracy in the doctor s records of the history and treatment of every case, and said that most of the difficulties which doctors have with the State Compensation Commission are due to misunderstanding which the doctor could explain, if he had the proper record

9 A medical department in the Cabinet of the President of the United States was suggested by Dr Simonton, who described the benefit that would come from a Cabinet Officer, such as is being proposed by the A M A He said that one of the Mayo brothers was

or advertises, or offers for sale, loan or distribution, any instrument or article, or any recipe, drug or medicine for the prevention of conception, or for causing unlawful abortion or purporting to be for the prevention of conception, or for causing unlawful abortion, or advertises, or holds out representations that it can be so used or applied, or any such description as will be calculated to lead another to so use or apply any such article, recipe, drug, medicine or instrument, or who writes or prints, or causes to be written or printed, a card, circular, pamphlet, advertisement, or notice of any kind, or gives information orally, stating when, where how, of whom, or by what means such an instrument, article, recipe drug or medicine can be purchased or obtained, or who manufactures any such instrument, article, recipe, drug or medicine, is guilty of a misdemeanor, and shall be liable to the same penalties as provided in section eleven hundred and forty-one of this chapter"

This Section was amended in 1881 by adding Section 1145 in order to exempt the instruments and advice of physicians when treating actual cases of disease Section 1145, the so-called "physicians' exemptions," reads

"Physicians' instruments An article or instrument, used or applied by physicians lawfully practicing, or by their direction or prescription, for the cure or prevention of disease, is not an article of indecent or immoral nature or use, within this article. The supplying of such articles to such physicians or by their direction or prescription, is not an offense under this article."

Since contraceptive treatment is not mentioned in the law of 1881, and is mentioned in that of 1873, an Assembly Introductory Bill No 35 has been introduced by Mr Remer so as to show clearly that contraception advice to his patients is the legal right of a physician The proposed amendment reads

Section 1 Section eleven hundred and forty-five of the penal law is hereby amended to read as follows

No 1145 *Physicians' instruments* An article or instrument, used or applied by physicians lawfully practicing, or by their direction or prescription, *for the contraceptive treatment of married persons or* for the cure or prevention of disease, is not an article of indecent or immoral nature or use, within this article. The supplying of such articles to such physicians or by their direction or prescription is not an offense under this article. No 2 This act shall take effect immediately

ROBERT LATOU DICKINSON, M D

Secretary, Committee on Maternal Health, New York City

TRI-STATE CONFERENCE

The eleventh Tri-State Conference of the officers of the medical societies of New York, New Jersey and Pennsylvania, was held on Saturday, February 2nd, in the Transportation Club in the Biltmore Hotel, New York Those present from New York State were Dr Harry R. Trick, President, who presided, Dr James N Vander Veer, President-elect, Dr James E Sadlier, past-president and Chairman of the Public Relations Committee, Dr John A Card, Speaker of the House of Delegates, Dr William H Ross, Trustee, Dr Joseph S Lawrence, Executive Officers, and Dr Frank Overton, Executive Editor

The conference began at 10 30 a m and continued until nearly 5 o'clock, with a luncheon intermission during which time, however, those present talked shop informally

The subject of discussion as announced on the program was "The opportunities of the County Medical Society" The conference was a continuation of a discussion of the same subject which was considered at the Tenth Conference at Atlantic City on November 10th, which was reported on page 1437 of the December 1st issue of this Journal Twelve principal subjects were discussed at the Eleventh Conference, the first six being introduced by Dr H O Reik, who was listed as the principal speaker of the conference

1 Dr Reik, speaking on the subject of securing new members, asked the question, "Are all available doctors enrolled as members?" He suggested that the Secretary of each County Society should write to the Biographical Department of the American Medical Association, in order to secure data on every doctor proposed for membership, as the A M A keeps a complete record of every doctor that passes a State Board examination, including his preliminary education Dr Reik suggested that each State Medical Society amend its constitution nad by-laws so as to require the record of the A M A before a County Society could elect a physician to membership

Dr W F Donaldson, Secretary of the Medical Society of the State of Pennsylvania, endorsed this suggestion

Dr James N Vander Veer suggested that the problem was not so much to get members as to arouse and maintain the enthusiasm of the older ones

Dr Frank Hammond, Editor of the Pennsylvania Medical Journal, said that the Pennsylvania State Society had tried the experiment of sending the State Journal to all nonmembers in order to stimulate them to join the County Society He also related an experience in trying to expel a doctor from the Philadelphia County Society for unethical advertisements and how, finally, after two or three years of talking about starting formal proceedings, a few leaders induced the objectionable member to resign quietly

2 The second subject discussed by Dr Reik was "Rule by the Majority" He argued that members of a county society debating a ques-

SECOND ANNUAL GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The New York Academy of Medicine conducted a "Graduate Fortnight" on the subject "The Problem of Aging and Old Age" during the first two weeks of October, 1928, as described in the September 15, and October 15 issues of this JOURNAL. The success of that series of lectures and clinics has led the Committee to make the following announcement of a second series to be given next October —*Editor's note*

The New York Academy of Medicine is making arrangements for a second series of lectures at the Academy, coordinated clinics, clinical demonstrations and courses in hospitals and teaching institutions of New York, on the subject of "Functional and Nervous Problems in Medicine and Surgery" The Fortnight will be held during the period October 7th to 19th, 1929

It is believed that this year's subject will attract not only the medical profession generally but also social workers and those especially interested in public welfare The field includes those functional disturbances which have been much neglected in the last thirty years, in comparison with the structural disturbances of the human body

Evening sessions will be held at the Academy at which well-known authorities will discuss many phases of the general subject During the mornings and afternoons specially prepared clinical programs will be presented in a number of the leading hospitals of the city It is planned to present a full day's clinical program in each hospital cooperating in the Fortnight. Among the special subjects which will be considered in the lectures and clinical program are

Sleep and insomnia.
Headache and migraine.
Endocrines and the vegetative system.
The involuntary nervous system.
General survey of the visceral neuroses
Metabolism and the vegetative nervous system.
Allergy and the nervous system.
The surgery of the vegetative system.
Post-traumatic neuroses
Post-operative neuroses
The psychoneuroses
The cardiac neuroses
The digestive neuroses
The vascular neuroses
Shock.
Psychotherapy
Hysteria.
Mental hygiene in connection with general practice.
Habit problems in children.

The profession is generally invited to attend No fee will be charged for attendance at any of the meetings or clinics on the program

THE ASSOCIATED PHYSICIANS OF LONG ISLAND

The thirty-first annual meeting of the Associated Physicians of Long Island was held on Saturday, January 26, in Brooklyn. About sixty members met at one o'clock in the Brooklyn Hospital for lunch as guests of the Hospital. A scientific meeting in the surgical amphitheatre followed The program of this session was planned after those of the years 1927 and 1928 (See editorial on page 190 of the JOURNAL for February, 1927) The program was prepared by Drs Walter Sherwood and Gordon Gibson, and special effort was made that each speaker should make a full preparation, so that he could deliver his message within a period of ten minutes The speakers carried out their parts with precision and the following program was given on schedule

PM		
2 30	1	End Results in Cases of Spina Bifida Dr William H Field
2 35	2	Clinical Demonstration (a) Typical Case of Multiple Sclerosis (b) Typical Case of Tabes Dorsalis Dr H R. Merwarth
2 45	3	68 Cases of Infectious Arthritis Treated with Vaccines Dr George E. Anderson
2 55	4	Observations on Prostatic Obstruction Drs William F McKenna and James Denton
3 05	5	The Practical Value of Electrocardiography Dr Edwin P Maynard, Jr
3 15	6	Recent Advances in Obstetrics Dr Eliot Bishop
3 25	7	Early Mobilization in the Treatment of Fractures Dr J B Given, Jr
3 35	8	Recent Advances in Pneumonia Therapy Drs W H. Lohman and A. E. Lamb
3 45	9	Some Cases of Omental Inflammation Dr John E. Jennings
4 00	10	The Histology of Gas Gangrene Dr James Denton
4 05	11	Older and Newer Treatments of the Cervix Uteri Dr R. L. Dickinson
4 10	12	Suppurative Phlebitis of the Sigmoid Sinus and Internal Jugular Vein Dr Frank Lasher
4 20	13	Renal Anomalies Dr N P Rathbun
4 30	14	The Practical Value of the Gastroscope (Clinical Demonstration) Drs H. F Kramer and J J Stefano
4 40	15	The Relation of the Bacterial Content of Milk to Digestive Disturbances in Infants Dr W H Donnelly
4 50	16	Typical *x*-ray Findings of Gastric and Duodenal Ulcer Dr Ruth Ingraham
5 00	17	Mesenteric Lymphadenitis Simulating Appendicitis Dr W A Sherwood
5 05	18	The Significance of the Liver Function Tests Louis Nerb, Ph.D

In the evening a banquet was held in the Hamilton Club, Brooklyn, after which an address with lantern slides was given by Dr John Foote, Professor of Pediatrics at the University of Georgetown, on the subject "Child Care in History and Art" This address was unique and interesting Dr Foote showed slides of paintings and sculpture illustrating the status and health of the child from early Egyptian times to the present Of special interest were the pictures showing the bottles

slated for the position, but Dr Reik said later that the position would go to Dr Wilbur

10 Dr Trick repeated the suggestion given at the Tenth Tri-State meeting, that lectures be given to medical students on the subject "The County Medical Society" (See page 1438 of the Journal of December 1, 1928) Dr Trick said that the State Medical Society would supply lecturers who would explain the methods and aims of the medical societies of the counties, state and nation, so that the graduates would seek entrance into county medical societies as soon as they started to practice medicine (This subject was discussed editorially on page 493 of this Journal of May 1, 1927)

11 The modern obligation of the medical profession was the subject of a half hour's address by Mr Lloyd Paul Stryker, Counsel of the Medical Society of the State of New York, who gave the substance of an address which he had delivered in New Jersey before the Hudson County Medical Society and which will be published in this JOURNAL of March 15

12 "The practical application of the suggestions made in the Tri-State conference" was the subject introduced by Dr W H Ross, Trustee of the Medical Society of the State of New York He began his remarks by quoting from an editorial entitled "The Tri-State Conference" which appeared on page 259 of the January issue of the Pennsylvania State Journal, in which the editor said concerning the Tenth Tri-State Conference, "In order that its real value may be fully realized, the wealth of ideas and suggestions must be put into effect by the workers in the field, discussion is worth while only when it eventuates in action" (See this JOURNAL, page 238)

Dr Ross then made the following suggestions

"1. The speaker of the day shall prepare his paper with the view to making definite suggestions and proposals for action

"2 He shall send the paper to each person expected to come to the conference

"3 Each person shall come to the conference prepared with definite suggestions regarding the proposals of the speaker

"4 The conference shall take definite action regarding the proposals"

Dr Reik, Secretary of the Conference, in closing the discussion, said that the meetings were conferences only, and were not intended to enforce any movement or decision If a point was not received unanimously it was dropped Each person attending the conference has the opportunity to express his opinion for the benefit of the rest He said that the conferees would be surprised to know how many new points of view the conference gives them The phrase of Dr Donaldson "Economic Introspection" was worth the price of the conference.

The conference voted to hold its next meeting late in the spring in Philadelphia, with the Pennsylvania State Society as host.

PHYSICIANS' ART CLUB

The Physicians' Art Club of New York closed its third annual exhibition at the New York Academy of Medicine on February 15 Over fifty physicians contributed painting, sculpture, etchings, photography and marquetry For the first time there has been a committee of awards, who passed professional judgment on the exhibits and awarded prizes to Dr Louis C Schroeder for his "Portrait Bust of a Boy," who was his own son, and to Dr Robert E Koch for his marquetry chess-board with its more than eight thousand pieces of wood

Honorable mention was awarded to Dr Robert L Dickinson for a group of his exquisitely rhythmic drawings including the original pen and ink drawing of the view from the roof of the Academy of Medicine which was published on page 40 of the January first issue of this JOURNAL.

Honorable mention was also given to the following exhibitors Dr Benjamin S Barringer for his painting "The Old Apple Tree," Dr Percy Fridenberg for water colors, Dr James A McCready for a portrait bust of Beethoven, Dr Arthur Nilsen for a portrait photograph of Sir St Clair Thomson

Among other exhibits of particular interest was the sculptured "Moses" of Dr I Seth Hirsch, and the photographs by Dr Frank R. Oastler and Dr Orrin Sage Wightman From the camera of the former was a group of "California Redwoods" which was quite superb in treatment, while the expert craftsmanship of Dr Wightman was well represented by a group of portraits of distinguished delicacy

Dr Theron W Kilmer, who has done a distinguished series of photographs of prominent medical men, showed three character study portraits in almost life size.

A graceful introduction to the program written by Dr Linsly R. Williams, Director of the Academy, closed with the hope that future exhibits will stimulate physicians to develop an avocation worthy of the best traditions of the medical profession

logic, presented with tact and consideration, that their money and efforts are being wasted or diverted into channels never intended by them If you do that, they shall be with us"

The following candidates were elected to membership Drs Isidore Goldberg, Emanuel A Manginelli, and George H Petti

Dr Boas, for the Committee on Public Health and Medical Education, presented the Preliminary Report of the Committee, with special reference to its investigation of Baby Health Stations

Dr Magid presented the Report of the Committee on Medical Economics, with special reference to the subject of the Credit Bureau

The program of the evening was devoted to Medical Economics and was as follows

(1) Address by Dr Harry R Trick, President of the Medical Society of the State of New York, with special reference to the State Society's attitude on some of the economic problems confronting the medical profession

(2) Address by Dr William Warren Britt, Chairman of the State Committee on Medical Economics, dealing mainly with the Medical Aspects of Workmen's Compensation

(3) Address by Dr Thomas P Farmer, Chairman of the State Committee on Public Health and Medical Education, presenting the attitude of his committee on the public health and economic problems of the medical profession

I J LANDSMAN, *Secretary*

ONEIDA COUNTY

The annual meeting of the Medical Society of the County of Oneida was held January 8, 1929

The following officers were elected at this meeting

President, Dr Hyzer W Jones,
Vice-President, Dr H F Hubbard,
Secretary, Dr William Hale, Jr,
Treasurer, Dr D D Reals,
Librarian, Dr T Wood Clarke,
Censors, Drs G M Fisher, W B Roemer, C R Bartlett, E M Griffith, E G MacFarland

Delegates to the House of Delegates Drs G M Fisher, J L Golly, and Dr Andrew Sloan, elected to serve two years in January, 1928, carried over

The following doctors were elected to membership Dr Ruth D Moore, new school physician in Utica, Dr Aaron Davis, Rome, Dr Schickry Farres, Utica, and Dr Albert L Crane, Utica State Hospital

Dr William B Roemer read the annual message from the retiring president, Dr Charles R. Bartlett of Boonville, who was ill and could not attend

"Allergic Diseases in Children" was the topic of a paper read by Dr T Wood Clarke He illustrated his discourse with charts A report was given by Dr T H Farrell, chairman of the committee working on closer relationship between the doctors and the Oneida Tuberculosis Committee

WILLIAM HALE, JR., *Secretary*

FULTON COUNTY

The 107th annual meeting of the Oswego County Medical Society was held in the Hotel Pontiac, Oswego, on December 4, 1928, with forty members present

Drs Anthony Cincatto of Fulton and Dr J K Spencer of Mexico were elected to membership

The following officers for 1929 were elected

President, S S Ingalls, M D, Fulton,
Vice-President, A G Dunbar, M D, Pulaski,
Secretary, G A Marsden, M D, Oswego,
Treasurer, Joseph B Ringland, M D, Oswego

A paper on Undulant Fever was read by Charles M Carpenter, Ph D, Diagnostic Laboratory, New York State Veterinary College Cornell University with the discussion being led by Dr C R Hervey of this city

Dr Edward J Wynkoop of Syracuse read a paper on Pyloric Stenosis, with discussion being led by Dr George A Marsden

Following the luncheon, served in the main dining room of the Pontiac Hotel at 1 30 o'clock, the election of officers was held, after which addresses were made by O W H Mitchell, M D, of Syracuse, chairman of the Committee on Public Relations, New York State Medical Society, Thomas Farmer, M D, Syracuse, chairman of the Committee on Public Health and Medical Education, New York State Medical Society, and Joseph S Lawrence M D, of Albany, executive officer of the Medical Society of the State of New York

from which "Pap," a cereal gruel, was fed to the babies as their principal food in the middle ages and as a result practically every child that was painted showed evidence of rickets, in the large square heads, bowed legs, and other signs of food deficiencies

The Associated Physicians of Long Island is an independent organization of about 1,000 physicians from all parts of the Island It publishes a Monthly Medical Journal, *The Long Island Medical Journal*, which is now in its 23rd year Dr E P Kolb, of Holtsville, is president of the Association, and Dr James Cole Hancock, of Brooklyn, is Secretary

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on January 16, 1929, was called to order at 9 p m , the retiring President, Dr, Gitlow, in the Chair

Dr Gitlow addressed the members on the subject of "Ideals" He then turned over the gavel to the incoming President, who said

"The purpose of our meetings is threefold social, scientific and economic My personal observations have led me to believe that the majority of the members of the Bronx County Medical Society are interested in the social end of the meeting first, the scientific paper next and the economic part last and least. Hardly anybody takes an interest in the business part of the meeting Whenever we have had an economic meeting in the past we have barely had a quorum attend We fully recognize the importance of the social end of our meetings We welcome and are glad to have with us those men whose only reason for coming is a desire to meet and chat with their friends and fellow practitioners, but no meeting can be conducted properly unless the members see to it that there is absolute silence during the transaction of business Let those men who are not interested in the proceedings meet in the lobby or the balcony of the large ballroom A great many of our members come to the meeting either to partake in the business of the Society or to listen to the scientific papers and it is their right that they be given a chance to hear Ordinary courtesy demands that the readers of papers or reports be given a chance to be heard Let me ask your help in removing the one great defect in our meetings which would otherwise be as interesting and as successful as that of any county in the state With your cooperation I shall endeavor to give you interesting, orderly, dignified meetings

"The modern young physician should charge for his time If he does not, his very patients will look down on him and think less of him But if he is to be content, he must unfurl the flag of idealism, raise it higher and march behind it no matter how hard and discouraging the march may be It is this flag that has for centuries made our profession the highest and foremost in all human endeavors

"For generations the practice of medicine has been a self-sacrificing priesthood The family physician was the friend, adviser and father confessor to every member of the household Times have changed The dispensary, the clinic, the district nurse, the social service worker, the welfare worker, the life extension institute, the specialist,—each one has had its share in gradually weaning the patient away from his family physician We must resign ourselves to do without the great affection of our patients, but we must prove to a cynical, skeptical, iconoclastic postwar world that we deserve their respect and trust

"I, as your President, am in favor of introducing a resolution at the next meeting of the delegates of the State of New York stating that division of fees when the exact amount each physician receives is itemized and approved by the patient is entirely ethical and in keeping with the spirit of the times

"The half-baked specialist must be eliminated from the medical profession by the medical profession demanding that no man be allowed to specialize until he has been properly trained

"Dispensaries, clinics, centers and welfare organizations, like the great religions of the world, have been conceived in high idealism and inspiration Unfortunately, like the great religions, the original ideals have been almost destroyed by their ritual and abuses The great evil of these welfare organizations has been the army of paid workers This group, in order to make itself indispensable, has set out to make a record in the quantity of the work done Quality and necessity have been ignored The original purposes of these organizations have been almost obliterated by a mass of unnecessary and often harmful activities

"The men and women who give their money and their time to maintain these organizations still believe in the great motive and high idealism underlying their existence If you gentlemen attack these organizations indiscriminately, you will do unlimited harm and no good whatever You will destroy the faith of these fine people in the altruism of the medical profession These people are the finest and most influential in our country We not only must not antagonize them but we must have their friendship and cooperation We must convince them by proof and cold

MEDICAL WARES

THE SPECTROSCOPE

The spectroscope is one of the most delicate and accurate means of making certain kinds of chemical analyses It reveals the constituents of the distant stars as well as of industrial gases and body fluids It is invaluable to the astronomer, the manufacturer, and the physician

A spectroscope measures the wave lengths of the light of different colors A prism refracts light in varying degrees,—the red rays least, and the violet most When light enters a prism from a narrow slit, it is spread out as a band of colors A minute examination of the distribution of colors in the spectroscope indicates the chemical nature of the source of light.

The spectroscope may be one of the most simple of all optical instruments It has four essential parts —

1 A narrow slit to admit light from the substance to be examined

2 A prism or other device to produce a spectrum

3 A scale for indicating the wave lengths of the light in the several parts of the spectrum

4 A magnifying eye-piece for viewing the spectrum and the scale

All these essential parts may be assembled in a serviceable instrument of about the size of a fountain pen The outer end of such an instrument has a slit of about the length of the letter "i" on the page of this journal The width of the slit is adjustable to a fraction of a millimeter When the instrument is held with the slit upright, and is pointed toward the substance to be examined, light of each wave length which passes through the slit forms an individual image of the slit, and the whole series of images form a ribbon of colored light, which is called the spectrum Each color is produced by light of a certain wave length, which is indicated by a scale seen above the spectrum These numbers are used for indicating the position of each part of the scale with great accuracy The scale which is generally used indicates wave lengths in mille microns A micron is one-thousandth part of a millimeter A mille micron is one-thousandth part of a micron or one millionth of a millimeter The wave lengths of the visible parts of the spectrum run from about 780 mille microns for the red, to 390 for the violet Photographic means also will enable an observer to detect infra red rays longer than the red, and ultra violet shorter than the violet

The scale on a spectroscope may also be indicated in angstrom units, each of which is one-tenth of a mille micron

The simplest practical application of the spectroscope is that of detecting the presence of elements when they are in the form of an incandescent gas Each element when it is heated intensely so as to form an incandescent gas, gives off light rays which are particularly intense in certain parts of the spectrum Sodium, for example, forms a narrow line of brilliant yellow of a wave length of 589 mille microns The presence of this yellow line indicates sodium in the substance under examination

The spectrum of an incandescent gas is called a bright line spectrum, because it consists of a series of bright lines running crosswise of the ribbon of the spectrum This form of spectrum appears in the spectroscopic examinations of minerals, as in the manufacture of steel

There is also a dark line or absorption spectrum which is produced when the light from an incandescent gas shines through a cooler atmosphere of the same gas For example, when a considerable amount of sodium is heated for some time, the outer part of its incandescent gas may become somewhat cooled, so that its bright line is replaced with a dark line, for the bright lines of the intensely hot gas are absorbed in passing through the cooler parts The dark line spectrum is of great value in astronomy The spectrum of the sun, for example, is crossed by dark bands indicating that its light comes from incandescent gases which shine through a cooler atmosphere of the same gases

A third form of spectrum is that in which there is an even illumination of the spectrum, with neither light nor dark bands This is called a continuous spectrum, and is that which is given off by ordinary artificial lights, such as fires and electric light bulbs

This form of spectroscopic analysis is the one which is used in medicine for making analyses in which color is the indicator It enables an observer to determine the exact composition of light which comes from a colored object such as blood The red color of hemoglobin, for example, is a characteristic mixture of red with orange and yellow which varies in a definite way according as the blood is arterial, or venous, or contains carbon dioxide

THIRD AND FOURTH GENERATION OF DOCTORS

My grandfather, Dr Simeon Snow, was a practicing physician for over forty years in the town of Root, Montgomery County, N Y He was born February 17th, 1803, and died September 20th, 1865

Dr Snow's daughter, Margaret, who was born in 1845 and died in 1914, married my father, Dr Albert Vander Veer, who graduated in medicine in 1863, and has practiced medicine in Albany since that time Three of his boys are now practicing medicine—Dr Edgar A Vander Veer, and his brother, James N, are practicing in Albany, and a third, Dr Albert Vander Veer, Jr, is in New York City

My son, Albert Vander Veer, 3rd, expects to graduate from the Cornell Medical College in June and to take up the practice of medicine in Albany, thus making the fourth generation of the family engaged in the practice of medicine.

My grandfather, Dr Simeon Snow, had a son, Dr Norman Leslie Snow, who practiced medicine in Montgomery County and Albany for over thirty years He was born in 1839 and died in 1885 His son, Dr Frank S Snow, graduated in medicine in 1889 and is now practicing at Palatine Bridge, Montgomery County, so that he is the third generation of the Snow family practicing medicine

EDGAR A. VANDER VEER

MEDICAL SCHOOL INSPECTIONS

Following the publication of the report on the survey of defective school children of Saratoga County on page 104 of the January 15 JOURNAL, the following letter was received from Dr William A Howe, Chief of Medical Inspection Bureau of the State Education Department, Albany, N Y

"I am pleased to learn that the Saratoga County Medical Society is interested in securing more effective corrective attention to physical defects found among school children The employment of nurses for this special phase of the work is, I believe, the most effective means available It should be clearly understood, however, that these nurses work with the physicians of the County and that they should not assume individual responsibility of selecting the cases that need attention or the physician to whom such cases should be taken The more I see of this work the more deeply I am impressed with the fact that the family physician is the one who should be depended upon for the necessary corrective attention This is the policy we are following in our school work and I feel progress is being made

"In Superintendent Alter's District in Montgomery County he has recently employed a full time woman physician to serve the rural schools in the five towns in his district This means 54 rural school districts with approximately 2,866 school children Two nurses are available who devote their full time assisting the physician and carrying out her instructions A dental hygienist is also employed who gives her full attention to that phase of the work

"The Board of Supervisors of Ontario County has as you may perhaps know established a school hygiene district on May 31st, 1928 $6,000 00 was appropriated at once for the salary of a health director for the District, his traveling expenses and a clerk

"Dr B T McDowell of Bristol Center was elected Health Director for the District He is thoroughly familiar with the rural conditions in the County and will work in full cooperation with the physicians in the District The Board of Supervisors stand ready to provide two nurses to devote their full time to assist the health director and the other rural physicians of the County Money, in fact, has already been made available for that purpose The situation in Ontario County is purely a local one It is their expectation to continue it as such It will be their effort to operate their program so far as they can with Ontario County people at a minimum expense with an increasing degree of efficiency It will be an interesting demonstration and I am sure we will all be interested to watch its development"

THE DAILY PRESS

PURE WATER PAYS

The City of Olean, Cattaraugus County, will pay dearly for its epidemic of water-borne typhoid, which started last September It has been decided in a number of legal suits that a city is responsible for damages which may arise from a public supply of impure water Commenting on the outbreak, the *New York Sun* of February 2, says editorially

"The Mayor of Olean has recommended to the Common Council that the municipal water rates be increased 50 per cent Half the increase is to pay what an epidemic of typhoid fever resulting from impure water cost the taxpayers The old rates are admittedly too low to meet the expense of proper maintenance of the water works, which are owned by the city

"Olean had a costly lesson in the dangers of a water supply system inefficiently safeguarded The people have already paid high for neglect—all in anxiety and remorse, many in illness, some in death The money penalty is heavy, but alongside the other penalties incurred it is negligible

"This should be a lesson to other cities and towns The State Department of Health says that there are a number of communities in the State where the water supplies are insufficiently or ineffectually safeguarded, and it emphasizes 'the foolhardiness of taking a chance and jeopardizing the health and the lives of the people of these communities when a comparatively small sum will insure the proper protection' A safe water supply is within the means of every town, an unsafe water supply is too costly for any town to endure"

The responsibility of physicians for water supplies is obvious The medical profession considers itself to be the guardian of the health of the sound and well as an impersonal principle, but it takes no less than a personal loss to rouse any physician to such a pitch of excitement that he goes before the City Board and demands safeguards over the water Fortunately a physician need not sacrifice his time and reputation fighting on behalf of the public This duty rests upon the medical societies which can act in an impersonal way The personal duty of the physician is to support his Medical Society, and its leaders who have a special gift for the practice of civic medicine

---

OBEDIENCE BY REQUEST

The psychology of influencing physicians to take part in medical society activities has an element of child training, in which there is a mixture of free will and compulsion This subject is discussed in a brief editorial in the *New York Times* of February 2, which says

"Elizabeth Wyckoff tells a story of a philosopher and well-known educator, 'one of the greatest men in America,' who represents the extreme left wing He was observed by a friend thoughtfully watching his young son, who was having a good time getting thoroughly wet and dirty in the icy water of a gutter almost blocked by slush

"'I am just trying,' said the great man on being questioned, 'to think of a way to make John *want* to come out of that gutter'

"At the other end of the argument is Alexander Black, with an essay on the need of a 'traffic cop' in every family This ungrateful job is allotted to mother Discipline should be her watchword She may enjoy presenting a 'sweet make-believe world' to her darlings but she must restrain herself 'It is rather a mean trick to conceal' from a child that everything works by severe laws which he may as well make up his mind to obey

"Between these two extremes parents must figure out a middle path If they are clever enough to think of a way to make children want to be obedient, they will be eligible to membership in both parties"

The editorial illustrates the attitude of the leaders of the Medical Society of the State of New York toward the members of County Medical Societies They sit up nights—in meetings and social gatherings—devising ways of making physicians want to put into practice the principles of organized medicine, and the results are seen in the rapidly increasing interest of doctors in the civic duties which devolve upon the medical profession

WOMEN AND VIVISECTION

An encouraging piece of news to the promotors of medical progress is contained in an editorial in the *Brooklyn Eagle* of February 5 Commenting on the attitude of women of the District of Columbia toward a proposed antivivisection bill, the editorial says

"House bill 11,993, now before Congress, would exempt dogs from vivisection in the District of Columbia and all other Federal jurisdiction areas Most women, we think, are fond of dogs, even of police dogs, fond of dogs of all breeds except the Dogs of War It was a French woman cynic who wrote "The more I see of men, the more admiration I have for dogs" And the sensibilities of women shrink from any spectacle of canine suffering Yet more than 2,000 delegates of the City Federation of Women's Clubs voted overwhelmingly against indorsing House Bill 11,993

"Undoubtedly the reasoning of Dr Simon Flexner was sound Experiments on dogs, as he said, "have done more to advance medical knowledge than experiments on any other animals, and are indispensable to scientific progress" And in a general way he was right in declaring that animal surgery today "is conducted as humanely as surgery on human beings"

"Hence the feelings of the 2,000 women delegates gave way to their sane judgment in the vote that was taken What Tennyson called "blind emotions" did not prevail If women handle the problems of citizenship with the same rationality they will justify the claims made in advance by the proponents and protagonists of universal suffrage"

MEDICAL WRITE-UPS

The daily newspapers sometimes accept medical write-ups of new discoveries prepared by reporters who have become professional freelances The usual course of events is that the reporter calls on a physician who is in the acute stage of an enthusiasm over a novel idea The reporter writes his article, quoting the doctor and making a plausible story which is accepted by the editor without further investigation When the doctor sees the story in print, he is as much chagrined as his medical colleagues

The *New York Herald Tribune* of February 4, carried a front page story entitled "Science Finds a Home Remedy Typhoid Cure," which is merely the old herb, wild indigo, which grows in yellow profusion all over the plains of Long Island

The paper quotes the doctor as explaining the origin of the investigation as follows

"The basis for our investigation is the fact that among primitive peoples everybody is more or less of a physician It is an instinct to fight disease They tried this, that and the other thing When you shoot with a scattergun a few bullets will hit the target. The primitive people hit on many valuable drugs, most of which have been taken over by standard medicine They also patronized magic and all kinds of useless remedies But where we find native tribes in different parts of the world or the country people of various different nations all using the same herb or treatment for the same disease it is a pretty fair chance that they have hit on something valuable"

QUACK CURES FOR COLDS

Dr Thomas G Simonton, President of the Medical Society of the State of Pennsylvania, said that one daily newspaper in his state had received $30,000 in one month for advertisements of cures and preventions of influenza New York, too, is in the midst of an epidemic of the same form of quack advertising, and the people fall for it, even those who are educated and are otherwise sensible

What are the objectionable statements in those advertisements? Here is one which appeared in the *New York Herald Tribune* of February 4, and in practically all the other daily newspaper of the city

"Treat your cold this pleasant way *X* will stop a cold before it gets started—Discovered while influenza raged Exhaustive tests traced the immunity to influenza of laboratory workers to chemicals with which they were working Analysis proved that a vapor given off by this concentrate actually killed the germs of common colds Here was an important discovery *X* the new product, came quickly into general use and now is daily attaining greater and greater popularity *X* the modern way to combat colds Its use is simple and pleasing A drop on a folded handkerchief—breathe the vapor—*instant* relief One application lasts all day A drop on both ends of your pillow will fight the cold as you sleep —an excellent way to treat the children's colds

"Get *X* from your druggist Each dollar bottle contains 50 treatments"

SYPHILIS A Treatise on Etiology, Pathology, Symptomatology, Diagnosis, Prognosis, Prophylaxis, and Treatment. By HENRY H HAZEN, A.M., M D Second Edition Octavo of 643 pages, with 165 illustrations St. Louis, The C V Mosby Company, 1928 Cloth, $10 00

In this new edition of his book Professor Hazen gives us a very up-to-date, comprehensive and detailed treatise on the subject of syphilis He takes up and discusses intimately the disease as it affects all parts of the body in all its stages The book is well and simply written making it easy for the general practitioner to use as well as the specialist. The book is replete throughout with a very extensive bibliography occurring at the end of every chapter, many pages being devoted to this part alone For the technician or the medical man that wants to do his own serology the author very conveniently goes into detail on the work along this line. The illustrations are numerous and well made showing the conditions as they occur in a very realistic manner The illustrations in color are very good and give the reader a very clear conception of the subject as described The captions of these illustrations are very novel in that they have gotten away from the old stereotyped method of just being a title and now give the reviewer a story-like description of the picture explained Many pages of the book are devoted to the subject of the treatment of syphilis and the author covers this in a most complete and exhaustive manner, going from the subject of prophylaxis right up through all the different types of the most up-to-date methods and the medicaments that are employed in the field of syphilology

GEORGE F PRICE.

STORY OF ELECTRICITY AND A CHRONOLOGY OF ELECTRICITY AND ELECTROTHERAPEUTICS By HERMAN GOODMAN B S, M D Octavo of 62 pages, illustrated New York, Medical Life Press, 1928 Boards, $1 50

The Story of Electricity is practically an interesting account of the origin of the present day progress

This small volume very briefly relates in chronological order the various contributions made to this science by its pioneers, dating from the beginning of the 17th century to the present day

It is the reviewer's hope and desire that this little volume will receive a very enthusiastic reception by all those interested in physics and in the physical field of medicine

B KOVEN

FORENSIC MEDICINE. A Text-book for Students and Practitioners By SYDNEY SMITH, M D Second Edition. Octavo of 602 pages, with 166 illustrations Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $8 00

This second edition of Prof Smith's book on Forensic Medicine, while designed for the specialist in Medico-Legal Matters, is, in our judgment, of value to the general practitioner and the lawyer

As the author describes it,—this book was written "as the title indicates,' for the elucidation of those medical problems which come before the legal authorities

The subject comprises two main divisions

First, and most important, deals with the medical practitioner in the role of a potential expert witness, and is intended to aid him to elucidate the various problems in crimes of violence

Second legal enactments concerning medical subjects Of course Prof Smith's unusual training qualifies him well in the preparation of a book of this kind

Without going into the subject matter of each chapter we feel that every physician should have at hand accurate information dealing with all phases of death, whether by violence or suicide.

Prof Smith treats thoroughly on these subjects as well as on methods of examination of blood stains the length of time a body has been dead, and whether from natural causes or otherwise.

He devotes chapters on Toxicology,—corrosive and metallic and vegetable poisons In fact, he has covered the field in a most thorough manner

Those portions of the volume wherein he quotes legal procedure, would not, of course, apply in this country

Nevertheless, this book is a valuable acquisition to the library not only of the Medico-Legal Specialist, but to the General Practitioner and Lawyer

We especially recommend the book to the legal profession to enable them to more intelligently examine medical experts

E E H

THE GENESIS OF EPIDEMICS AND THE NATURAL HISTORY OF DISEASE. An Introduction to the Science of Epidemiology Based Upon the Study of Epidemics of Malaria, Influenza and Plague By CLIFFORD ALLCHIN GILL, M R S C, L.R.C.P Octavo of 550 pages, illustrated. New York, William Wood and Company, 1928 Cloth, $7.50

This book on epidemiology is written by an author whose experience qualifies him to speak with authority on this subject. As Lieutenant-Colonel in the Indian Medical Service and Director of Public Health, Punjab, Dr Gill has been for many years a keen student of the epidemic diseases of India. He now presents to us in this volume the results and conclusions of a carefully planned piece of investigation in a realm of which so little is really known, and in which so many uncertainties exist.

The writer presents his quantum theory of the genesis of epidemics This theory postulates the essential dependance of such outbreaks on the loss of equilibrium between infection and immunity due primarily to an increase in the infection quantum. The theory gives careful consideration to the range of amplitude of the quantitative changes in the transmission and immunity factors and the influence of climatic and seasonal conditions in determining great and sudden elevations of the infection quantum and a corresponding depression of the immunity quantum.

The diseases particularly studied are Malaria, Influenza, and Plague. The statistical data presented corroborates the viewpoint expressed.

The book is attractively bound and the printing is well and neatly done

JOSEPH C REGAN

A LABORATORY MANUAL OF PHYSIOLOGICAL CHEMISTRY By D WRIGHT WILSON Octavo of 272 pages Baltimore, The Williams & Wilkins Company, 1928 Cloth, $3.50

To arrange a course of laboratory experiments in physiological chemistry may not be so difficult. But, to choose the ones most suitable and to give clear and concise directions so as to lead the student easily and directly to the proper conclusion, requires a thorough knowledge of the subject and a high degree of skill in teaching These two qualities are not often found together Prof Wilson happily has them both and, as a result, the book is an excellent guide.

The book has two parts In the first part, the experiments relate to the general principles of biological chemistry The recognition of inorganic constituents the subject of acid and alkali, electrolytic dissociation, colloids and the general characteristics of proteins, carbohydrates and fats are taken up in this part.

In the second part, the chemistry of the various body tissues and fluids is taken up A chapter on pathological urine and several chapters on quantitative urine analysis, on metabolism studies in the urine are also added. In another chapter, directions are given for experiments in dietary deficiencies At the end are logarithm tables

The few paragraphs of theoretical discussion scattered through the book, are quite a help, while the interleaving is a great convenience

An excellent book for the purpose designed.

BENJAMIN DAVIDSON

BOOK REVIEWS

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A M, M.D Thirty-eighth Series, Volume I Octavo of 307 pages, illustrated Philadelphia and London, J B Lippincott Company, 1928

This volume, as usual, contains articles covering the various branches of medicine and surgery Barker discusses amoebic dysentery, Reid of Boston, bacterial heart disease, Deaver, uterine fibroids and Judd the pathogenesis of gastric and duodenal ulcers, the latter being the 1927 Mutter lecture of the College of Physicians of Philadelphia. Many other American and foreign writers contribute

W E McCOLLOM

SELECTED PAPERS ON INJURIES AND DISEASES OF BONE. By SIR WILLIAM IRELAND DE C WHEELER, B A, M D Octavo of 148 pages, illustrated New York, William Wood and Company, 1928 Cloth, $4 00

Journevs far a-field bring inspiration to the brain-weary surgeon, and the personal touch of the thinker and worker from another realm is stimulating to renewed and better effort at home

This little volume of Sir William Wheeler from Dublin is part of the man, showing a few problems met in fracture and bone work by him, put down on paper in an understandable way, and showing how the author has faced and solved them

An hour or so spent in getting acquainted with the author will bear a large percent of interest.

R DURHAM

LABORATORY MANUAL FOR THE DETECTION OF POISONS AND POWERFUL DRUGS By DR. WILHELM AUTENRIETH Authorized translation by William H Warren, Ph D Sixth American Edition from the Fifth German Edition, completely revised with extensive additions Octavo of 698 pages with 60 illustrations Philadelphia, P Blakiston's Son & Company, 1928 Cloth, $6 00

This book, which is in its sixth edition is an enlargement of its previous editions It treats of the laboratory methods for the detection of various poisons It is arranged in six chapters The first three chapters comprise the three main groups of poisons such as the volatile, non-volatile poisons, and the poisonous metals The remaining three chapters deal with those poisons not found in the three main groups Also with the poisonous and powerful alkaloids There is also a description of the various apparatus used in the tests and the preparation of the various reagents used Methods for the detection of blood stains are also included The book is a very authoritative treatise on the subject of poisons, and should be a great aid in their detection

E H NIDISH

A HANDBOOK OF HISTOLOGY By A McL WATSON, M.A, Ph D 12mo of 207 pages, illustrated New York, William Wood & Company, 1928 Cloth, $3 75

This book should very well serve the purpose for which it was intended, namely a manual for the medical student The brevity and conciseness with which the tissues and the organs of the body are described here, makes it a helpful and handy little volume for the student, especially when in need of a hasty comprehensive review of the subject

S H POLAYES, M D

HEALTH AND WEALTH A Survey of the Economics of World Health. By LOUIS I DUBLIN, Ph.D Octavo of 361 pages New York and London, Harper and Brothers, 1928 Cloth, $3 00

The catchy title and an inclusive sub-title overstate the text The book is a collection of fifteen addresses touching on questions of individual and community health, health costs, and health-work-economics The theme changes with each chapter, and the motif is inflected to fit the changing audience. Many interesting facts are presented The proponents of communistic or state medicine will find valuable material for propaganda quotations But why were these papers published in book form? What was the urge?

The answer may be found in the fact that the author is an insurance statistician. Just as no one knows so much about raising children as an old maid who has never been broadened by child bearing, so no one knows so much about health matters as the literary doctors who have had no experience in the practice of medicine. Mathematical formulae, to some minds, will explain everything, past, present and future. Facts are flexed or conformed to magic mathematical "factors" and the laws which govern their use The relation of cause to effect is always clear, mathematically, even when the ordinary mind hesitates to define the premises of relativity May a divine Providence protect the people and their medical advisers from statistical regulation, and from the extended encroachment of civil government into the practice of medicine which the author advocates

These papers are marred by irrelevant personal conclusions on current events and national policies, supported neither by the force of figures nor by logical argument. They indulge, also, in petty criticism of the medical profession They are, however, excellent for light reading and idle-moment pastime The serious reader will find them a somewhat superficial exposition of the subject

F E ELLIOTT

COLLECTED PAPERS OF THE MAYO CLINIC AND THE MAYO FOUNDATION Volume XIX, 1927 Octavo of 1,330 pages illustrated Philadelphia and London, W B Saunders Company, 1928 Cloth, $13 00

As in previous volumes, the material has been selected from papers written by members of the staffs of the Mayo Clinic and the Mayo Foundation to meet the interest of *the general surgeon and the diagnostician.* Papers of interest to the greatest number are presented in full, those in more limited fields of medicine are abridged or abstracted, and those in special fields are indexed according to the journal reference. All this from the Foreword of the volume, and also the interesting fact that of the 398 papers that were considered for republication in this volume, 100 are reproduced in *full, 34 are abridged,* 44 are abstracted briefly, and 220 are referred to by title

The subjects are grouped under various heads, in a rough anatomical classification,—the first 414 pages being devoted to the Alimentary Tract. The name of William J Mayo appears most frequently in connection with articles of philosophical or historical significance. The main articles on gastric technique are by Donald C *Balfour—his conclusions* being that conservatism is still being followed in gastric surgery

This volume differs in no way from those that preceded it in scientific interest and in its value as a means of disseminating the great fund of information to be found in this extraordinary medical center

J R.

ATROPHY

"Maltose is indicated in very difficult feeding cases and in severe cases of malnutrition and atrophy. It is part of the routine in the treatment of chronic indigestion from fat Carbohydrate indigestion is more frequently seen in cases fed on lactose or on cane sugar. in such cases maltose is indicated."

MEAD'S DEXTRI-MALTOSE

MEAD'S DEXTRI-MALTOSE is usually indicated for feeding difficult cases

While all carbohydrates can cause nutritional disturbances, it has been shown that Mead's Dextri-Maltose is the form least likely to cause such disorders as fermentative diarrhoea, indigestion in infants, having a low tolerance for sugar

It is because this carbohydrate is better tolerated by the majority of infants with an inclination to diarrhoea that it is used so extensively in cases where such a condition has been present

This, coupled with the fact that it can be given sooner and in larger amounts in cases recovering from nutritional disturbances, is added assurance that satisfactory gains in weight will result with less danger of a return of the complaint

From Text Books of over a decade

THE MEAD POLICY

Mead's infant diet materials are advertised only to physicians. No feeding directions accompany trade packages. Information in regard to feeding is supplied to the mother by written instructions from her doctor, who changes the feedings from time to time to meet the nutritional requirements of the growing infant. Literature furnished only to physicians

THE TRI-STATE CONFERENCE

An editorial in the January issue of the *Pennsylvania Medical Journal* expresses the proper attitude of those who participated in the tenth Tri-State conference which was held on November 10, 1928, in Atlantic City The subject was "The Opportunities of a County Medical Society" The editor says

"In order that its real value may be fully realized, the wealth of ideas and suggestions developed must be put into effect by the workers in the field Discussion is worth while only when it eventuates in action

"Many of the ideas presented in this report are practical in the extreme, and their adoption by a county society should increase its effectiveness manyfold A reading of the report, also, should help the members in the ranks as well as the officers to appreciate the problems of those who are responsible for guiding the destiny of the organization of which they are an integral part

"It is safe to say that medical practice, as it is now conducted, is made possible only by organization practice It behooves us each, therefore, whether officer or private member, to do our utmost to strengthen the association which holds so strategic a position in modern life To this end the Tri-state Conference report will serve as a helpful textbook"

The editor offers an improvement in the manner of conducting the Tri-state Conference—the formulation of opinions and decisions It does little good to listen to a number of unrelated suggestions The real object of the conference is to choose and classify the suggestions and agree on those which shall be considered standard in the three states The great object of the conference is to reach agreements on broad policies to be adopted by the medical societies

COMMUNITY SERVICE OF A COUNTY MEDICAL SOCIETY

The January issue of the *Journal of the Michigan State Medical Society* contains the president's address by Dr H S Collins, of Kent County, in which Grand Rapids is situated The following extracts show that the aims of the Kent County Medical Society are about the same as those of the societies of New York State—*Editor's note*

The county medical society of today evidences the real democracy of medicine, for here all physicians meet on a common level for the purpose of studying medical problems, presenting cases and discussing questions of public health involving the welfare of the community Primarily organized for the essential purpose of advancing the interests of science and the education of its individual members in medical subjects, it has now broadened its field of endeavor to educate the public in the applied principles of preventive medicine, to enlighten them on the needs for further protection against medical frauds and quacks, and to cooperate with lay organizations in the betterment of health

The most important function of county societies in the community is public health education The earlier this is impressed upon the young individual, the more lasting and valuable is its effect Periodical health inspections of school children cause the child to become interested in his own health and he will continue to seek medical knowledge with inspired confidence in the medical profession as he grows older The public health education committee of the medical society will do a real service to appoint a staff of well qualified speakers to give instructive health lectures upon such subjects as "Toxin-antitoxin Immunization," "Prevention of the Common Cold," "Vaccination," "Exercise," "The Treatment of Simple Injuries," and historical talks upon the lives of such men as Jenner, Pasteur, Lister and other well-known founders of preventive medicine It should be explained that the early treatment and correction of congenital and acquired deformities will lessen the disability and lead to independent, useful citizenship

The public is sufficiently educated today to be taken into the confidence of the physician on medical subjects They resent an attitude that apparently classes them as children The cults have been quick to realize this and have taken advantage of it to commercialize

A medical society can render a great service to the community in influencing proper legislation governing medical practice There are today in Michigan unscrupulous individuals, who misrepresent medical information and extort exorbitant fees from the public for

(*Continued on page 241—adv xvii*)

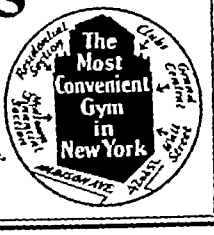
(Continued from page 238)

worthless services The name "Doctor" is not absolute assurance of standard medical qualifications

Every medical society should have a civic relations committee, whose duty it is to attend meetings of civic committees, taking active part in all matters where health, hygiene and sanitation are involved. Our own Kent County Medical Society's special committee on clinics should be renamed and given instructions to indulge in questions of this nature Perfect relationship between all health agencies and clinics and the medical society should be established Much criticism by the profession of certain free clinics has existed in the past and the physician has always been regarded secondarily The question has always been, "are physicians the architects of the health house, or are they the workers?" Medical men should themselves be in control of clinics and co-operate with lay organizations, thereby securing successful and satisfactory function Our own President-elect Harris of the American Medical Association, has suggested that medical societies operate all free clinics and thereby render their own services to persons unable to pay Such an example is seen in the Cass County Medical Society, representing the physicians of Fargo, North Dakota Since 1923, they have been actively co-operating in a community health program which at the present time is successfully controlled

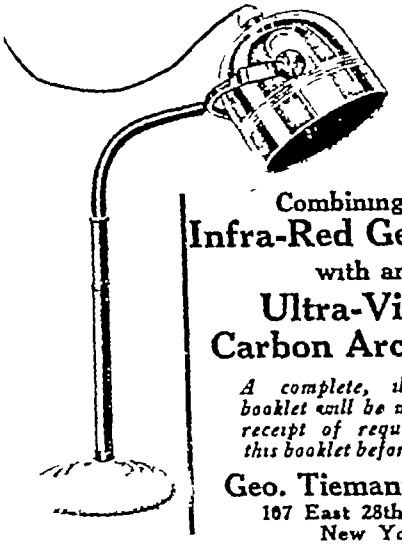
Another service can be rendered to the community in constructive opinions on the laws regulating the sale of milk Certified, pasteurized and grade "A" raw milk are being advocated. Health departments of each community need the support of organized medicine for education of the public in these things Even the Metropolitan Life Insurance Company is now publishing paid advertisements giving information on the qualifications of certified milk

Our own Kent County Medical Society, during the past three years, has indulged in most all of these same functions and has made a creditable showing We have sponsored our first health examination week and for three years have conducted a course of school and factory lectures on health subjects We have practically written the new milk ordinance of Grand Rapids and have studied the free clinic situation and thereby established satisfactory relations with the health agencies We have laid the foundation for an active campaign against quacks and medical frauds and are interested in a number of other civic enterprises involving public health



Few Doctors Prescribe Patent Nostrums

—yet many doctors prescribe exercise for their patients and let it go at that



Be sure your instructions in this regard are carried out to the letter by sending them to McGovern's Gymnasium There the patient's work is planned in accordance with your own diagnosis A report of attendance and progress is sent you at regular periods, insuring that your exercise prescription is being competently filled

Ultra-Violet Combined With Heat and Light Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities have shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deep-seated disorders

Not only does this ADVANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultra-violet radiation plus the radiation of infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arc combines ultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

Sanitarium & Hospital Equipment Co.

Battle Creek Michigan

Other Battle Creek Therapeutic Appliances

Oscillo-Manipulator

This appliance, through years of development, has become a tested substitute for hand massage It has proven of great value in practically all cases in which general or localized massage is indicated

"Veelite" for Infra-red

This lamp radiates soft, penetrating rays of infra red Unique features are the new V-shaped element and ease of adjustment.

Vibratory Chair

A therapeutic unit of proven value for the application of vibration in the treatment of disease The entire nervous and circulatory systems are reached by Vibratory Chair treatment.

Solar Arc Lamp R-40

"16 The average cost per case for compensation was $149

"17 The average cost for medical service per case for these 4 651 cases (keeping in mind what medical service embraces) was $42.20

"18 The percentage of medical service cost for these 4,651 cases was 22½%

"19 The average cost per case for medical service for the 19,045 cases recorded was $15.77

"20 The average amount of compensation paid per case was $149

"21 The average medical cost per case is equal to about 10% of the amount paid for compensation per case

"The average cost per case for medical service for the following classified groups of injuries of the 19,045 cases, was

Laceration and Cuts	$ 9 50
Bruises and Contusions	12 10
Foreign Bodies	6.28
Sprains and Strains	12.28
Fractures and Dislocations	33 11
Burns and Scalds	10 38
Infections and Poisons	14 80
Herniae	101 35

"Balance paid for surgical and medical service $210,113

"The total number of physicians in Nebraska is approximately 2,000

"Total number of compensation cases treated in 1927, 19,045

"Average number of compensation cases treated per physician, 9

"Average amount received per physician, per case, $11 77

"Average total amount received per physician, $105

"Average gross income of physicians in Nebraska, $6,500

"Average percentage of income received from Workmen's Compensation fees, 01½ per cent.

"The total cost of medical service rendered to 19,045 injured workmen for the year 1927 was $300,394 24 The amount left the insurance carriers for administration purposes for the year was $587,692, which is 190% of the total cost for medical service In other words the administration sum of insurance carriers was $289,293 more than the entire medical service cost

"The total amount paid for compensation for the year 1927 was $692,594 15

"The total amount of compensation paid to 19,045 injured workmen by insurance carriers was only $104,902 15, more than the amount set aside by for administration purposes

CONSTIPATION

In the Breast-Fed Infant

HORLICK'S MALTED MILK has long been used with success in the prevention and correction of constipation among breast-fed infants

For the Nursing Mother—

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's — the Original—Malted Milk, knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby—

Supplementary feedings of "Horlick's" almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation.

WORKMEN'S COMPENSATION LAW IN NEBRASKA

The January issue of the *Nebraska State Medical Journal* contains a review of the administration of the Workmen's compensation law by Dr C C Johnson of Lincoln The article is readable and informative as may be seen from the following extracts

"1 The amount of premiums collected by insurance carriers for the year 1927 was $1,573,649

"2 The amount expended for losses for the same period was $998,957

"3 The difference between these items is the balance left for the carriers, which was $587,692 This balance is equal to 60% of the total amount paid for both compensation and medical service for the year of 1927, and is a fairly comfortable margin

"4 The total number of cases recorded was 19,045

"5 The total amount of money paid for medical service was $300,394 24

"6 The average cost per case for medical service was $15 77

"7 The total number of cases requiring medical service was 19,045, but 14,394 or 70% of these cases recovered in the first 7 days and, therefore, under the law received no compensation

"8 The total cost for medical service for this group of 14,394 cases that received no compensation was $104,125 84

"9 The average cost for medical service per case for this group of 14,394 cases that received no compensation was $7 24

"10 The total number of cases that received medical service and also compensation was 4,651

"11 The total amount of compensations paid to this group of 4,651 cases, was $692,594 15

"12 The average amount of compensation paid per case was $149 00

"13 The total cost for medical service (keeping in mind what medical service embraces) for these 4,651 cases was $196,264 40 (this sum is the difference between $300,394 24, the cost of all cases for medical service, and $104,125 84, the cost for medical service for the 14,394 cases that received no compensation)

"14 The total cost for medical service and compensation for these 4,651 cases was $888,859 50 (this being the difference between the total cost of 19,045 cases which was $992,984 39 and the cost for medical service only, for 14,394 cases that received no compensation which was $104,125 84)

"15 The cost of compensation for these 4,561 cases was $692,594 15

(*Continued on page 243—adv* XIX)

which their columns would be purged of fraudulent advertising The National Better Business Bureau was designated as the agency to investigate alleged fraudulent advertising, and to notify publishers and, if necessary, governmental agencies whenever false advertising is published or offered for publication

"It is most laudable that American periodical publishers are taking this very altruistic stand When laymen are up and doing in this regard, it is most unfortunate that physicians will condone the acceptance of unethical advertisements for publication in their official bulletins

"Attention was called to the fact that at the stated meeting of the Board of Trustees of our State Society held the morning of the day of the Secretaries Conference, the Board of Trustees approved lending every support to the National Better Business Bureau, an organization composed of and supported by the business of advertising, the most competent agency of assistance to the business of advertising in preventing fraud in advertising and selling The said National Better Business Bureau has expressed its willingness to co-operate in every way with the publishers in eliminating fraudulent advertisements

"In conclusion, a plea was made to the Conference, that the component county medical societies of this State which carry advertisements in their county society bulletins be urged to adopt a resolution to the effect that they will not approve advertisements for proprietary remedies not acceptable to the Council on Pharmacy and Chemistry"

CARE OF THE INDIGENT SICK BY THE COUNTY MEDICAL SOCIETY

Iowa has developed a method by which the county medical society cares for the indigent sick at a price that is agreed upon by the governmental authorities—who in Iowa seem to be those of the county The method is the subject of an editorial in the January issue of the *Journal of the Iowa State Medical Society*, which says

"Furnishing medical service for the county poor presents a serious problem to the members of most county societies in Iowa The Haskell-Klaus law provides for those needing hospital care, and the situation here referred to does not in any way affect the operation of that law, but the ambulatory and home bedside cases and all inmates of county jails, poor farms, etc, present a grave problem How is the county to pay for medical services for these cases that must be cared for locally? Super-

ADVERTISEMENTS IN COUNTY MEDICAL SOCIETY BULLETINS

Over one-half of the County Medical Societies of the State of Pennsylvania publish monthly Bulletins An editorial in the January issue of the *Pennsylvania Medical Journal* calls attention to the unethical practice of many of these Bulletins in accepting advertisements of articles which are not acceptable to the Council on Pharmacy and Chemistry of the American Medical Association The editor describes the action taken by the Pennsylvania State Society as follows

"The question of county medical society bulletins in this State accepting advertisements not approved by the Council, hence not accepted by our State Journal, was presented for discussion by the Publication Committee of the Journal to the Board of Trustees at the 1928 meeting of the State Society held at Allentown last October It was the opinion of the Trustees that they had no jurisdiction over the activities of the county society bulletins The Trustees, however, passed a resolution to the effect that the Board looked with disfavor upon a county society bulletin accepting unethical advertisements The editor of the Journal was instructed to present this matter at the conference of county medical society secretaries and editors of county society bulletins to be held at Harrisburg, December 4th, and this was done

"Attention was called (a) to the book on Official Rules of the Council That the object of the rules is 'primarily with the object of protecting the medical profession and the public against fraud, undesirable secrecy, and objectionable advertising in connection with proprietary medical articles' (b) To the book on New and Non-official Remedies These publications may be secured by writing to Prof W A Puckner, Secretary, Council on Pharmacy and Chemistry, American Medical Association, Chicago, Ill

"Attention was called to a meeting at which periodical men voted for a voluntary housecleaning to curb fraudulent advertisements Six thousand American periodicals, through representatives who met with members of the Federal Trade Commission at the Waldorf, New York, October 10, 1928, agreed to a voluntary method of housecleaning by means of

(*Continued on page 245—adv xxi*)

(*Continued from page 246—adv xxii*)

endered Incorporation of the county society s a necessary step since the corporation can hen enter into a contract with the supervisors, nd more especially since incorporation re- ieves the member physicians of any individual iabilities for acts of others

"The Council is giving special attention to his growing development among component ocieties in Iowa, and will gladly assist, hrough the state office, any society interested n this plan"

This editorial is worthy of serious study by he physicians in every governmental unit of New York State Since the towns, villages nd cities are the usual units for giving relief n New York, there would be difficulty in ar- ranging the details of the contracts There should not be much opposition to such a plan, for every doctor receives a benefit in the relief rom paying dues, even if he treats no public cases

DISTRIBUTION OF RURAL DOCTORS

The distribution of doctors in Missouri is discussed in the following article from the December issue of the *Journal of the Tennessee State Medical Association,* which clipped it from the *Youngstown, O , Vindicator*

"A more even distribution of physicians practicing in Missouri is to be attempted by the board of health of that state As doctors who have been licensed to practice are free agents and may set themselves up where they will, the matter presents problems that are not easily solved So the state authorities are going about the solution in the only practical way, on a supply and demand basis The latest check of doctor and patient population shows that there is one doctor for every 608 persons in the state But the distribution of physicians to meet the needs of the population is more intricate than just alloting so many potential patients to each practicing doctor and letting it go at that, even if the men of medicine were subject to arbitrary assignment For some communities have need for medical advice more acutely than others, not only because of population congestion, but for reasons of district health problems

"So the supply and demand factor is to be emphasized, the state board of health being now employed in plans for a very careful survey of the state to learn the status of every community with reference to the need of physicians This will serve two purposes Many communities are in need of medical attention and at the same time many physicians are in need of practice A careful survey would result in both needs being filled"

Cheplin's B. Acidophilus Milk

Accepted by the A.M.A. Council on Pharmacy and Chemistry

An Active Culture of Bacillus Acidophilus of Proven Intestinal Habits

Years of continued use of this product has definitely established its value in

Chronic Constipation
Mucous Colitis

(*Continued from page 245—adv xxi*)

visors, social workers, volunteer agenci medical societies and individual physicia have tried various solutions, but, with c single exception, every method has vario drawbacks, most of which end by worki numerous hardships upon the medical p fession

"This successful method has for someti past been in satisfactory use in five societi Three others are now contemplating adopti of the same system The plan is that of blanket contract between the medical socie and the county supervisors, by which t county pays a fixed annual sum in return f which the society furnishes for the coun poor all medical care not provided at t University Hospital under the Haskell-Kla law (including chronic or incurable cases di charged to make room for those who can b benefited by hospitalization at Iowa City)

"The annual payment varies from $1,000 t $3,250 and goes into the society treasury Ser ice to the indigent sick is rendered upon orde of the supervisors, township trustees, or othe authorized persons, and such service is dis tributed among the members of the society a evenly as possible

"The societies having such contracts ar Hardin county, Marion county, Marshall coun ty, Webster county and Waterloo (the latte being limited to the city of Waterloo) Mon roe, Page and Tama counties have similar pro posals under consideration The advantage of this plan, according to its advocates are

"1 Unjust inequalities in payment to phy sicians for indigent services, eliminated

"2 Removal of friction between the county medical society or its members and the board of supervisors or social workers

"3 General satisfaction of the community with its physicians because of effective medical service given to the indigent sick

"4 A full treasury which solves the finan cial problems of the county society

"The latter point is an important one in many ways The secretary-treasurer never needs to worry about collecting dues, nor members about paying, for county, state, and A M A dues can all be paid out of the general funds of the component society Expense money is always available to bring the best of speakers from even distant points, so that the problems of the program committee are solved

"As an illustration of the financial success of this plan, it is interesting to note that the society which receives the smallest per annum payment still has in its treasury some $7,000 Such surplus can of course be distributed annually among members on the basis of service

(*Continued on page 247—adv xxiii*)

(*Continued from page 248—adv xxiv*)
mean the development of an entirely new system of national scope. Since such national organizations are already in existence, it would seem best that the foundations limit their activities to those already undertaken It is doubtful, also, whether it would be advisable for the correlating agency itself to do research work It would perhaps be most successful by confining itself strictly to the work of organization, direction, correlation, interpretation, and dissemination"

The editor decides that the leadership in the coordination of research belongs with the physicians, and says

"There is one far-reaching national organization, already thoroughly established, and made up of those who are most interested in the problem of health—the county, state, and national medical associations There is no class of citizens so vitally concerned in research into the normal and abnormal functioning of the human body as physicians There is no organization with potential resources quite so comprehensive as those enjoyed by the system of medical societies which forms a network covering the entire United States and its possessions Furthermore, there is no organization with better facilities for international exchanges Channels for this fellowship are already in existence, and need only use to develop their function to the fullest

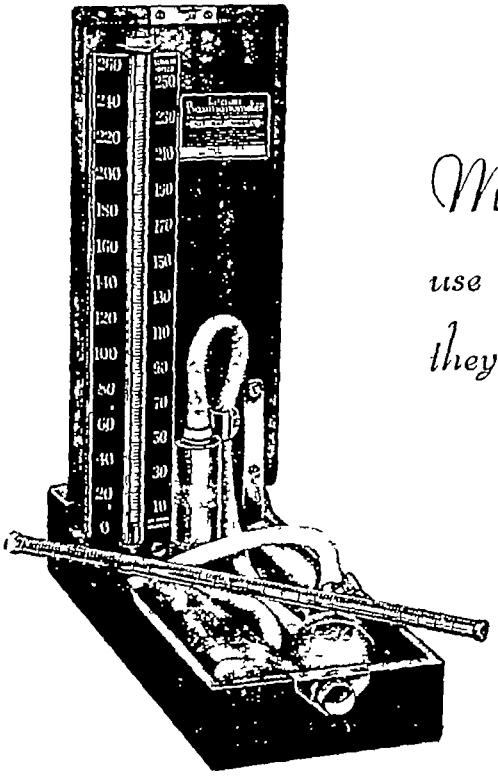
"The medical organizations of the country owe it to themselves and to their clients to establish a pretectorate in health agencies Cooperation with governmental agencies, foundations, and lay organizations is not only desirable but imperative, but the initiative should arise from the medical societies Theirs is the responsibility and theirs is the privilege This does not mean that the medical societies must necessarily finance a large program of research work If the machinery were provided, the financial support would be forthcoming from the many individuals interested in this type of work The responsibility is great and the opportunity knocks Let the county, state, and national medical societies answer the call"

It is to be hoped that the editor will go a step further and that the Pennsylvania State Medical Society will devise a practical demonstration of the leadership of physicians in medical research

MEDICAL RESEARCH BY THE STATE MEDICAL SOCIETY

The leading editorial in the January issue of the Pennsylvania Medical Journal is on the subject "Coordination of Research" and is a plea that the medical societies shall assume the direction of medical researches, and the compilation of the results Who shall be the coordinating agents? The writer discusses how the agents may be the trinity of groups engaged in giving medical service to the people 1, those supported by the State, 2, those controlled by voluntary organizations, and 3, the medical societies

The editor first discusses the official groups and says



"The first and most obvious would be the designation of such an agency by the national Government There is now a bill before Congress to establish a National Institute of Health, using as a nucleus the Hygienic Laboratory already in existence This Institute would be under the control of the Surgeon General of the United States Public Health Service, and its purpose would be pure scientific research relating to the cause and prevention of diseases The bill has been approved by the Senate Committee of Commerce. According to the report of this committee, 'the plan of the institute is to make of it a great cooperative scientific organization in which leading experts in every branch of science will be brought together and given opportunity to work in unison for the purpose of discovering all the natural laws governing human life, and especially to learn those variations of such laws which are detrimental to human health' It is difficult to overestimate the importance of this bill, and if such an institute is established, it might prove to be the best agency for correlating the research in health done throughout America"

The editor adds that every State health officer of a county, or, a large hospital in the county could assist in the coordination

In regard to the voluntary organizations the editor says

"The second possibility would be the utilization of the organizations established by the large health foundations to correlate the activities of research workers, throughout the country This would necessitate, however, the building up of local cooperating agencies, and would

EDICAL WORK ON THE FARM

The January *Journal of the ıca State Medical Society* re- orts the remarks made by Mrs ıchardson, Chairman of the omen's Committee of the Iowa arm Bureau Federation before ıe state conference of secretaries f county societies The follow- ıg abstracts contain an outline of hat the speaker said about the re- ıtion of the Farm Bureau to ıedical Societies

"Naturally, we in trying to make etter farm homes and communi- es, are interested in health and ygiene The regular educational ork of the Farm Bureau comes rom the extension division of our tate college More than a third f our counties each year study utrition I feel that we have made good start, for surely nutrition a step in the direction of health ut it is only one phase of health, nd we want further aid and help he project of child care and arent education is another project e are studying from the extension ivision This project has helped s to see the crying need for com- unity and home hygiene We are lad to have the assurance that the ıedical association will help us to arry out such a program

"Here are a few ways in which believe you can help us We ant *First*, reliable, authentic in- ormation about (a) serum treat- ıents, (b) immunization, (c) in- ections diseases, (d) diets (for ducing etc) *Second*, we want o know medical standards—some ay of protecting our folks against uacks, fads and irresponsible so- alled healers *Third*, we want elp in developing health projects r programs that we know are cor- ect and efficient'

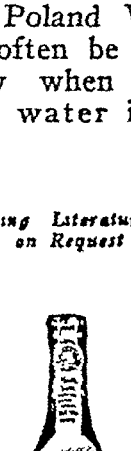
ADVERTISING RATES IN THE CALIFORNIA STATE JOURNAL

The January issue of *Cali- ornia and Western Medicine* he organ of the State Medical ocieties of California, Nevada nd Utah has the following editorial remarks on its advertising rates—*Editor's note*

It may be gratifying for members at large to know that the 50 per cent increase of advertising rates recommended last year goes into effect with this January issue, with practically no loss of advertisers, an indication that California and Western Medicine has made for itself a place of some value in the opinion of firms who seek to call their products to the attention of members of the medical profession In this connection members of the California, Nevada, and Utah Medical Associations are urged to mention this journal in all requests for literature or price schedules A considerable number of advertisers keep a careful record of the source of such inquiries and place their volume advertising patronage accordingly Advertisers appreciate inquiries for information Such requests for information cost members only a small amount of effort and postage, but may mean much in aiding the California Medical Association to build up its reserve funds and activities

MEDICAL LEGISLATION IN TEXAS

The January issue of the *Texas State Journal of Medicine*, discussing methods of medical legislation, editorially says



"The State Medical Association must rely upon its members to do this work of reaching legislators, in the main, from home Sometimes it is necessary that our members work both through the mail and through personal visits to Austin At no time does the State Medical Association undertake to employ a paid lobby It is content with representation consisting of one of its employes, who spends most of the time at Austin This representative, Mr Jeff Reese, has a telephone and may be reached at any time by any of our members who desire to assist in our legislative work'

THALLIUM MEDICATION IN TINEA CAPITIS AND OTHER DERMATOSES REQUIRING EPILATION*

By E WILLIAM ABRAMOWITZ, M D, NEW YORK, N Y

From the Department of Dermatology and Syphilology, New York Post Graduate Medical School and Hospital.

Introduction—The element thallium was first discovered by Sir William Crookes in 1861 It is a soft metal that occurs in many species of pyrites and blende and is deposited as a fine dust where metallic products are volatilized in kilns The element resembles lead in its physical and mechanical properties, and is used in the making of dyes, ordinary glass and phosphorescent colors The chemistry of thallium compounds is like that of silver, bismuth, gold or aluminum Thallium may be monovalent and trivalent and forms thallous and thallic salts with acids The thallic salts are less toxic and more soluble. The protoxid of thallium acetate ($C_2H_3O_2Tl$) also called thallium acetate (oxpdulated), is the one favored by Cicero (1) and others for epilation, but two other acetates of this metal exist All salts of thallium probably share in the particular action of this element and it is a question whether the thallium acetate obtained on the market is a pure protoxid or a mixture of the three acetates of this metal Thallium acetate is soluble in water, less so in alcohol and hardly at all in ether or chloroform.

Therapeutic Uses—The acetate of thallium was at first utilized for the treatment of night sweats in pulmonary tuberculosis and for the symptoms of dysentery An average dose of 1-3 grains (0 06-0.2) of the acetate was given two or three times daily It was also used in a two percent solution as an irrigation for urethritis and cystitis The drug was soon abandoned as it caused an alopecia, with general symptoms of a severe toxic nature

The clinical use of thallium as an epilating agent dates back to 1897 when Sabouraud (2) was visited by a lady who developed a sudden loss of hair on the scalp Although he attributed this to a possible nervous origin he suspected the patient had received thallium, because he had encountered such cases previously Further investigation revealed that she recently had some symptoms of dysentery and for this had received (just fifteen days previously) 0 32 grams of thallium acetate divided into four pills of which she took two a day for two days With the exception of two locks in front of her ears, the entire scalp was denuded of hairs This had occurred in four days time (Six weeks later the hairs had regrown.) Following this experience, Sabouraud tried to epilate six cases of tinea tonsurans, giving the thallium by mouth and also by rubbings of a ten per cent thallium cream, and succeeded He also applied a one per cent cream in hypertrichosis and sycosis He abandoned this drug altogether when he developed his more accurate roentgen-ray epilating dose and on account of the toxicity of the drug

In 1900, Buschke (3) reported his first experiments dealing with the biological effects of thallium on animals and since then he and his coworkers have made some valuable contributions to the mode of action of this drug The results of these experiments, which have been confirmed by others will be discussed later Due credit must be given to Buschke for this persistent and painstaking experimental work to establish a normal depilating dose for the clinical use of thallium

Various financial and technical difficulties present at the time in Mexico City, forced Cicero (see footnote 1) in 1917 to turn to thallium as a means of treating tinea tonsurans in his locality He at first applied a ten per cent thallium acetate in vaseline to a six year old patient affected with tinea of the scalp and obtained a successful result But as this required fifteen consecutive daily applications, he tried a simpler method and gave the drug by mouth in one dose, using five milligrams of thallium acetate per kilogram of bodyweight, a dose first suggested and used by Sabouraud Depilation appeared sixteen days later and was complete on the twentieth day Regrowth began in six weeks, and two months later the hair on the scalp resumed its normal thickness There were no untoward symptons By the end of 1918 he had treated a total of 354 cases with no complications to speak of (V Par-

MELLIN'S FOOD BISCUITS

The delicious flavor of Mellin's Food Biscuits appeals at once to the most fastidious taste They are, at all times, most acceptable, are readily digestible and may be eaten freely

They are composed to nutritive elements that are quickly available for nourishment with but little digestive effort, therefore they may well be included as a part of the restricted diet for invalids, convalescents and the aged

These Biscuits are particularly suitable during the period when the baby is being weaned and the introduction of solid foods becomes necessary, for they contain a large percentage of Mellin's Food, which is recognized everywhere as nourishment especially appropriate in early life All through this period and well into early childhood, Mellin's Food Biscuits are a valuable addition to the diet

Older children will appreciate the delicate flavor of Mellin's Food Biscuits, will soon realize their nutritive value and will be happy to have their mother include Mellin's Food Biscuits in their school luncheons, in luncheons for afternoon outings, trips to the country, to the seashore and other playtime hours of all seasons

Fatigue from mental strain, weariness from bodily exertion, faintness from missing a meal and other similar conditions common to everyday life are relieved by eating a few Mellin's Food Biscuits

Mellin's Food Biscuits may be used freely either alone or with other foods They furnish very acceptable nourishment to serve with tea, coffee, chocolate, ice cream or frozen fruit dishes, with ginger ale and fruit drinks of all kinds —*Adv*

TREATMENT OF LUMBAGO

The most frequent cause of lumbago is lumbar strain The disease involves one or more joints and may extend to the sacro-iliac articulation This condition must be carefully distinguished from arthritis of the spine, from sacro-iliac disease, and from deep-seated abscesses The entire sacro-iliac region is very painful on pressure, on bending or turning and thickenings are frequently found outside the muscle substance, which can be verified in the radiograph

The most effective treatment of this condition (*Wiener Klinische Wochenschrift*, Feb 2, 1928) is rest in bed for from 8 to 14 days in a well-warmed room and with cutaneous counter-irritation.

Physicians find that applications of hot antiphlogostine placed over the lumbar region for two or three hours every day for about two weeks usually bring marked relief in these painful conditions Warm full baths are to be avoided. A flannel binder should be worn during the attack and is recommended for a month afterward to prevent a recurrence of the attack—See Advertisement page iii —*Adv*

CHARLES B TOWNS HOSPITAL

Any physician having an addict problem is invited to write for "Hospital Treatment for Alcohol and Drug Addiction" Charles B Towns Hospital, 293 Central Park West, New York City See advertisement page xxxi of this JOURNAL.—*Adv*

DIABETIC DIET READJUSTMENTS

Some foods cannot be allowed in diabetic diet at all and others only sparingly This means a readjustment in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar-free foods looks like and tastes the food that it replaces in the diet. With the variety of foods, possible through the use of Lister's Flour, the patient is satisfied There is no temptation to "cheat" and the case is the better kept under control Some of the Lister foods are

Bread Biscuits, Cheese Biscuits, Lunch Biscuits, Drop Cakes, Cookies, Spice Cake, Charlotte Russe, Lady Fingers, Bread Pudding "White" Bread, Nut Bread, Spiced Bread, Gold Cake, Pie Crust, Pie Fillings, Filled Doughnuts, Meringue, Muffins, Pancakes, Waffles, Salmon Croquettes, Fried Noodles, Fluff Cakes, Breadsticks, Doughnuts, French Toast, Spiced Muffins —Advertising page i—*Adv*

SEDGWICK INVALID ELEVATOR

Many physicians and surgeons have displayed interest in the development of an absolutely safe and easily operated invalid elevator, not prohibitive in cost, that would eliminate stair-climbing for those patients weakened by illness or age. To this end the Sedgwick Hand Power Automatic Brake Invalid Elevator was perfected and has been unanimously endorsed by its users and their medical advisers See advertisement page xxx —*Adv*

HORLICK'S MILK MODIFIER

Horlick's Milk Modifier, a new product made by the Horlick's Malted Milk Corporation, Racine, Wisconsin, is now being introduced to the medical profession This maltose and dextrin product, which is derived exclusively from malted grains, was first announced at the annual meeting of the American Medical Association in Washington, D C., in June, and created much interest. Since that time it has been presented to convention gatherings in other parts of the country

Horlick's Milk Modifier is presented and supplied to the profession along ethical lines No feeding directions accompany the package A statement on the wrapper is to the effect that the product is for prescription by physicians only

In conformity with the Horlick policy, the Milk Modifier is put up in hermetically sealed glass jars only The one-pound size retails at $75 and the five-pound jar at $3 00 The fact that it carries the name "Horlick's" is a guarantee that only the finest materials are used

In the June 18th issue of the *Journal of the American Medical Assn*, under the heading of New and Non-official remedies the acceptance of the Horlick Milk Modifier was announced by the American Medical Assn See advertisement page xviii —*Adv*

SHANNON LODGE
Bernardsville, N J

The famous balneological treatments for the Chronic Rheumatic diseases, including Arthritis, Sciatica, Lumbago, Neuritis and Gout, are now available at restful Shannon Lodge, at Bernardsville, in the beautiful Somerset Hills. Results identical with those obtained at hospitals and sanitariums abroad Trained physicians and nurses Newly equipped Ideal surroundings of a fine country home. Golf, tennis, billiards, bridle paths Elevation 800 feet—superb view of the countryside Enclosed sun parlors, airy sleeping rooms Finest cuisine Protected water supply from natural springs Within pleasant driving distance of all New Jersey points

Send for descriptive Booklet or better yet, drive out and see Shannon Lodge yourself Visitors always welcome. Consultation puts you under no obligation —See advertisement page xxv —*Adv*

always correspond to the age of the patient The prescribed quantity of the drug administered by mouth, was given once only and never repeated

Epilation started from the tenth to the nineteenth day and averaged fourteen days after administration of the treatment Epilation was complete in nine patients and occurred anywhere from twenty-one to twenty-four days or an average of twenty-two days after treatment. The affected hairs usually began to loosen first, followed by those on the rest of the scalp, and was not so spontaneous as with the roentgen ray Sometimes a small "temporal fringe" or tuft remained above the ears This was the so-called "Sinneshaare" of Buschke The eyebrows and hairs in other parts of the body were never affected Regrowth in seven cases began after twenty-eight to forty-six days, or an average of thirty-six days after treatment Hilda W who was cured and had a good growth of hair on the scalp after three and one-half months, had an incomplete epilation so that the beginning of regrowth could not be determined with any exactness James S, had a normal regrowth in four months In two brothers John and Warren McG, 8 and 4½ years old respectively, the oldest boy developed severe pains in the arms and legs just before epilation began The pains settled in the lower part of the legs and in the ankles and were so severe as to keep him in bed He was unable to walk for almost three weeks Repeated examinations by Dr Alec Rabinovitch of the Neurological Department showed nothing aside from a possible polyneuritis He is now perfectly well The younger brother had symptoms of a similar nature but not enough to interfere with his daily activities Both seemed to have lost weight and appeared pale, but complete blood counts on both boys were normal with the exception of a 11 per cent. eosinophilia in the oldest Both children were blonds, blond children sometimes depilated more readily and these two were amongst the first six to receive the thallium on a fasting stomach All subsequent cases were treated three or four hours after a light lunch not only with equally successful results but without the slightest indisposition The experience of Lewin (11) was of a similar nature With the exception of two patients, still under observation, all in this group were cured and no relapse had occurred so far Normal regrowth was present in two and the others were all on towards it. Figures 1 and 2, photographs of James G, showed the appearance of the scalp before the administration of thallium and twenty-two days later, when depilation was complete A mild folliculitis was noted in some patients during depilation, but this cleared up as soon as regrowth be-

do Castello of Havana informed me recently that Cicero's cases now totaled over one thousand) Sainz de Aja and Zuloago (4) reported in 1922 on the local action of a cream of thallium acetate and sulphate, preferring the former as the results were more rapid and less toxic In a personal communication from Urueña of Mexico City, I was told that the oral administration of thallium resulted in no serious accident in over 612 cases of tinea capitis treated by him As early as 1923 he reported a successful result in a woman, 26 years old affected with tinea capitis (5) In 1924 the writer (6) called attention to Buschke's experiments with thallium, but did not give it a clinical trial for fear of the toxic action strongly emphasized by Sabouraud Peter (7) in 1926 reported some cases of his own and focussed the attention of those interested in the clinical application of this drug to the large experience of his Mexican colleagues Cicero and Urueña Numerous reports have appeared since from different parts of continental Europe and England The first publication in this country on thallium was the recent article of Felden (8) who treated 47 cases with fungus disease of the scalp, citing most of the literature on the use of this drug

Author's Experience With Thallium Acetate In Tinea Capitis, Using It Alone and Also Combined With the Roentgen Ray

In the following study, Kahlbaum's thallium acetate was used exclusively and as it was not in tablet form, the estimated dose was carefully weighed by the pharmacist at the New York Post-Graduate Hospital Dispensary, each time before it was administered The dose in milligrams was mixed with a little milk sugar, placed in waxed paper and later emptied into half a cup of cool water for the child to drink When this was drained some more water was added to the same cup to make sure all of the thallium was taken No bad taste was complained of The first six patients received this on a fasting stomach, the others took it three or four hours after a light lunch, with no difference in results The same bottle containing the drug was used throughout, care being taken to keep it well stoppered in order to prevent any possible deterioration Seaston and Wilson (9) had many failures which they ascribed to an inactive thallium salt caused by exposure to the air with the formation of carbonates When they observed proper precautions, depilation was the rule Buschke and Langer (10) used an ordinary thallium acetate put up by Kahlbaum in tablet form in convenient milligram doses, the preparation being known as "Thalliumdepilatorium" These authors believed that purification of this salt caused it to lose some of its activity Urueña found that a fresh thallium acetate caused earlier depilation than an old preparation

Our patients with the clinical diagnosis of tinea capitis were first observed under the Wood's filter after the hair was clipped It was found that the infected hairs showed up with a significant greenish fluorescence under this light and were thus more easily detected and utilized for microscopic examination or culture

A careful history of organic disease, followed by a general physical examination if necessary, was then made and a test of the urine ordered The patient's weight in the nude was checked by another observer to insure accuracy and the dose of thallium acetate in milligrams per kilogram of bodyweight was estimated with the same precaution Patients with a cardiac or nephritic history and those that appeared small or under weight for their age, were referred for roentgen-ray epilation

Eighteen cases of tinea capitis were treated, eleven boys and seven girls The youngest was 2 years and the oldest, 11 years of age. The duration of the disease varied from two weeks to three months All showed the characteristic lesions on the scalp and with one exception were positive on microscopic examination or culture. The Wood's filter was not only an aid in detecting the positive areas but in determining the question of relapse or cure The types of ringworm found on culture as reported by Dr George M Lewis of our skin clinic were as follows

M audouini	12
M lanosum	2
Contaminated	1
No growth	2
Culture not taken	1

The first two cases were treated locally with a five per cent ammoniated mercury ointment, the next few patients used a ten per cent iodine in goose grease, but in the majority, Buschke and Langer's method was followed, i e, ten per cent sulphur in vaseline to be applied one day, followed by one-half strength of the tincture of iodine the next day The local treatment was started immediately after the hair was clipped and the drug administered and continued unless irritation developed, till a full regrowth occurred. The scalp was washed with soap and water every day When the hair started to loosen, the parent was advised to use a tweezer and we at the clinic applied an adhesive plaster cap to remove any hairs remaining Paper caps were used as headgears to prevent reinfection and spread of the disease to others If of school age the child was returned to class only after regrowth of the hair took place and provided no lesions were detected by the Wood's filter, checked up by the microscopic examination and culture

The following ten patients, seven boys and three girls, varying in age from 2 to 9 years, received 8 milligrams of thallium acetate per kilogram of body-weight The total dose of the drug varied from 98 to 212 milligrams It did not

only one-half that amount, two on a basis of 8 milligrams per kilogram and one on a basis of 7 milligrams per kilogram The results were as follows

Buschke and Langer (see footnote 10) cautioned against the use of thallium in those beyond the age of puberty and also in those children under weight for their age According to these authors, weight did not seem to follow endocrine development with age, and as thallium seemed to act as endocrinopathic agent, the curative and

lethal actions were somewhat too near for use in such patients To meet this contingency, they were the first in 1922 to try the combined treatment and obtained some good results by using a 4 milligram per kilogram, thallium dosage combined with a two-fifths Holzknecht erythema dose of roentgen ray over five fields of the scalp, filtering with one-half millimeter of aluminum (14) Dowling (15) tried this method in six cases and found it to be either a failure or incomplete, excepting in one case The results obtained in a larger series of cases, six cures out of thirty-three, by Lourier and Zwitkis (16) with varying amounts of thallium and roentgen ray, were not much better The results in table 4 were disappointing Although the roentgen ray and thallium seemed to have a different mode of action, supplementary doses of each were worthy of further trial in adult patients affected with fungus diseases of the scalp, especially favus

Experience with Thallium in an Adult with Favus of the Scalp One patient with favus of the scalp was treated with thallium alone This was an Italian woman, 41 years old, that weighed 45 26 kilograms The duration of the disease was said to be thirteen years The entire top of her scalp showed an extensive alopecia with scarring, activity being still present as evidenced by microscopic examination and culture The examination by the Wood's filter showed the usual greenish fluorescence noted in tinea capitis She received 4 milligrams per kilogram of body weight or a total of 180 milligrams of thallium acetate, in one dose by mouth One day following this she developed general body pains and dyspnœa, that kept her in bed for one week Epilation began on the thirteenth day at which time she appeared at the clinic, no worse the wear for her experience Epilation continued for the next three weeks and the scalp was clearing nicely under sulphur ointment and half-strength tincture iodine Unfortunately epilation was not complete, and regrowth began before all the old hairs fell out The result may yet be favorable in spite of this

HYPERTRICHOSIS Two patients with hypertrichosis were treated with Sabouraud's

gan The affected parts lagged behind in the growth of new hairs

The following three patients, one girl and two boys received 7 milligrams of thallium per kilogram of bodyweight The total dose of the drug varied from 139 to 229 milligrams

There were one cure and two failures The discrepancy between total dosage and age and the effects on epilation and regrowth were shown in Joseph C, who was underweight for his age An 8 milligram dose per kilogram of body weight might have produced complete epilation but perhaps toxic symptoms also Buschke, Dostrowsky (12) and others cautioned against the use of thallium in those underweight for their age, especially when it amounted to 30 per cent or more Urueña wrote me that he used an 8 milligram dosage per kilogram of body weight, for children older than six years, for those younger than that, he used 5 to 7 milligrams according to age. Kleinmann (13) used a 7 mg per kg dosage for those over 25 kg and an 8 mg per kg dosage for those below that weight.

Two patients received thallium at 6 milligrams per kilogram with the following results

The parent of Frances A, failed to carry out local treatment but Rose McC, did receive it. Both failed to depilate completely and resulted in a failure

Another group, three in number, received one-half of an unfiltered epilating dose of roentgen ray according to the Kienböck-Adamson-Mac Kee method They were also given instead of the full dose of thallium per kilogram of body weight,

soon as they discontinued this work One of the men became very ill and finally developed a retrobulbar neuritis and optic atrophy Buschke cited a recovery after an attempted suicide with thallium, the patient developing an alopecia, severe neuralgic pains and gastro-intestinal symptoms Luhrig (22) reported a death in a child from a rat poison containing thallium sulphate, the child vomited, had diarrhoea and cramps and survived only twenty-nine hours Kaps (23) also reported a death from rat poison This man, 29 years old ate food that some one with criminal intent contaminated with the vermicide In a short period the victim took a total of 2.25 Grams of thallium sulphate He developed paresthesias and pains, alopecia, conjunctivitis and a dermatitis of the face and finally a retrobulbar neuritis Autopsy showed degeneration of the heart, liver and kidney

REACTIONS AND SEQUELAE With therapeutic doses of thallium in man, reactions as high as 25 per cent are reported They are mostly of a mild nature consisting of pains usually about the ankles either before or at the time of epilation, salivation, palor, fever, loss of weight, anorexia, achlorhydria listlessness and a mild folliculitis of the effected parts In some instances severe and alarming symptoms have developed Such was the report of Ritter and Karrenberg (24) who saw a six year old child, treated with thallium, develop a generalized but fleeting exanthem and an unfavorable change in behavior that seemed to be of a permanent nature Other observers have reported a secondary anemia, choreiform movements and convulsions, paresthsias, arthralgia, myasthenia, generalized alopecia, albuminuria, nephritis, urine retention, dysenteric symptoms and dyspnoea Conjunctivitis has been reported but no serious eye complications have been noted by anyone in any of the patients thus far treated These reactions were not always after large doses and did not seem to be due to any cumulative action of the thallium They resembled lead or arsenic poisoning Dixon was able to find thallium in every tissue of animals poisoned with this drug, the skin contrary to arsenic contained the least amount Dostrowsky could not find thallium in the blood or hairs in his treated cases He could demonstrate it in the urine up to 27 days in those that had reacted and until 44 days in those that did not According to Devane (25) thallium was not eliminated entirely until two and one-half months had elapsed Some of the serious sequelæ appeared quite late after the taking of the drug

BLOOD FINDINGS AFTER THALLIUM DEPILATION The blood count determinations, especially the presence of eosinophilia, was the subject of study by several investigators of thallium therapy In a study of eosinophilia in various dermatoses, Schamberg and Strickler (26) found that the blood of children affected with tinea capitis, gave an average count of four and one-half per cent This was twice the amount of eosinophiles usually found in normal children used as a control Bobrov and Kogan (27) found that fungus infection of the scalp or body was invariably accompanied by an eosinophilia, especially when this infection was generalized They also found that this eosinophilia was reduced with improvement and increased in case of a relapse Kleinman (see footnote 13) with Buschke and Flamm, noticed a lymphocytosis with eosinophilia that appeared two weeks after thallium and disappeared in three weeks Szentkiralyi (28) explained the secondary anemia and loss of weight encountered by him as due to a functional endocrine disturbance He believed that the pain in the bones occurring after the treatment might be due to the effect of this drug on the bone marrow

Twelve of our tinea patients treated with this drug had complete blood counts taken There were twenty-one such examination made by F H Westcott and A C Cipollaro of the house staff of the New York Post-Graduate Hospital. An average eosinophilia of five per cent was encountered, reaching as high as eleven per cent in one case In one patient with a relapse there were no eosinophiles at all although the count taken at the prior attack gave a percentage of seven Only in two out of seven instances did a reduction in the eosinophiles correspond with definite improvement The hemoglobin tests and red corpuscle counts were within normal range The white cell counts were 21,000 in one case and as low as 6,100 in another The average was 10,633 The small lymphocytes varied between twenty-one and sixty-six per cent and averaged forty-seven per cent These blood counts were taken on the day of treatment, in one patient and at various periods after that in others, as conditions permitted, up to the time or regrowth Aside from the eosinophilia and slight lymphocytosis, there were no appreciable changes noted in the blood of patients treated with thallium, that seemed to be of any significance

Four patients had their blood examined for sugar, urea nitrogen, uric acid and chlorides The reports showed that they were within the normal limits The urine reports of all patients after taking thallium, were all negative

Indications and Contraindications in the Use of Thallium —The reactions after a therapeutic dose of thallium pointed to the proper choice of cases, to the careful supervision of the patients before and after treatment It should be a rule never to repeat the drug, certainly not within three or four months after the last dose

The age of puberty was a strong contraindication against the use of thallium and above that age, hardly justifiable except in very special instances The local use of the ointment or the solution by ionization for hypertrichosis and

thallium cream The formula for the latter was as follows

		gm. or c.c.
R	Thallium acetate	0.3
	Zinc oxide	2.5
	Vaseline	20.
	Lanolin	
	Rose water, of each	5.0

This was applied daily for fifteen days, a sufficient amount being rubbed in on the affected areas for five minutes This was a short treatment compared to the daily applications for eighteen months, used by Sabouraud It was only after that period of time that he obtained a decrease in half of the length and thickness of the hairs on the chin Cicero claimed acceptable results with the 1 per cent cream The results in the two patients treated with the fifteen day method were still awaited The 10 per cent cream originally used for epilation of the scalp was considered too toxic for use on the face In general the amount of the drug used in ointment form or otherwise should not exceed that of 5 milligrams per kilogram of body weight, or 300 milligrams of the thallium in a course of treatment Care should be exercised not to get any of the thallium in the mouth Laqerriére (17), Louste, Juster and Dramez, (18) used ionization, giving a treatment every four days to the chin and lips on areas one square centimeter in size, for a total of eighteen treatments The positive pole with a 2 per cent thallium acetate solution was applied for ten to twenty minutes using five to ten milliamperes of current No definite destruction of the hair papillæ was obtained, but soon after the eighth treatment the hairs wert more readily removed Although the hairs returned later they were more delicate, less abundant and very easily extracted In those areas not so treated the hairs were said to remain as usual This method will be tried next if the results we obtained from the one per cent cream continued to remain unsatisfactory

SYCOSIS BARBAE Thallium cream was used in tinea barbæ and ordinary sycosis by Buschke, Sabouraud, Saint de Aja and others Buschke and Peiser in 1922 used an ointment that contained thallium acetate 1 1,000 and applied three grams (45 grains) of this to the face on three consecutive days, but an alopecia of the scalp accompanied the facial epilation Ionization with a 1 1,000 solution of thallium acetate produced similar results Buschke and Peiser were not in favor of the local treatment Stümpke (19) tried a four milligram dosage of thallium and a one-half epilating dose of roentgen ray to two cases with pustulation of the bearded region of the face and neck and obtained fairly good results, but loss of hair on the scalp also appeared

MONILETHRIX One case of monilethrix was treated with thallium by Lourier and Zwitkis and all hairs with the exception of those on the nape of the neck, returned normal Buschke also treated one case of this kind but was awaiting the permanent nature of the cure The thallium seemed worthy of further trial in this incurable affection of the scalp

ALOPECIA AREATA AND OTHER TYPES OF BALDNESS Although epilation was not required as a part of the treatment of alopecia areata, Buschke and others used thallium in small doses on account of the rapid regrowth that was noted following epilation from this drug Excepting in children, the use of this remedy was not justified, because of the general untoward effects of this drug in those above the age of puberty The same remarks applied to alopecia prematura and other types of baldness in the adult When one of our patients (Alfred S, see table 2) was first brought to the clinic with tinea capitis, his mother definitely stated that the boy's hair on the scalp never grew longer than one inch at the most When the hairs began to regrow after thallium, no noticeable increase in the length of the hairs was noted

MODE OF THALLIUM ACTION Space will not permit to give in detail the results of the numerous experiments performed by Buschke, Langer, Peiser and others on different animals, in order to discover the mode of action of thallium They showed that the peculiar epilating effect is supposedly due to a disturbance in the endocrine-sympathetic system The alopecia is explained not by a direct effect on the hair papillæ as in roentgen-ray epilation, but by way of the sympathetic nervous fibres influencing the nutrition of the hair which makes them fall out. Atrophy of the hair bulbs, like that seen in alopecia areata, was noted by Urueña, Cicero and others after thallium Lourier and Zwitkis reported the finding of many split hairs Mac Kee informed me that Pardo Castello of Havana had also noted some beaded and hooked hairs All these observations were confirmed in our patients in the several instances in which the hairs were examined and in addition fracture of the hairs could also be seen Dixon (20) however believed that thallium acted on the automatic nervous system like strychnine, allowing reflexes to pass through them more quickly In that case the hair fall after thallium might be explained by the expulsion of the old hairs by the added stimulus given to the hair papillæ Lewin (see footnote 11) in one-third of his thallium cases found a red line dermographism that lasted almost one-half hour during the period of epilation and concluded that this denoted an irritability of the sympathetic nervous system produced by this drug

TOXICITY The toxic action of thallium, at first observed in animals was now fairly well known in man Rube and Hendricks (21) reported alopecia, anorexia, colic, body-pains and nephritis, in workers engaged in extracting thallium from pyrites, with improvement in health as

cap, etc, and as with the antiseptic treatment, has to be rigorously attended to

The hairs examined during thallium epilation showed atrophy of the bulbs as in alopecia areata Beading, bending, fracture and splitting of the hairs were also occasionally observed There was no report of a permanent alpecia, regrowth always occurring

The tinea patients treated with thallium showed on examination of the blood an average eosinophilia of five per cent This was the usual percentage reported in children infected with this fungus whether they are treated with thallium or not A slight lymphocytosis was occasionally observed after thallium

The blood chemistry of chlorides, urea nitrogent, uric acid and sugar, in four patients treated with this remedy, were within the normal limits Albuminuria was not encountered

The toxic action of thallium is sufficient to cause death in animals and man, as reported in the literature Twenty-five per cent of reactions had been reported with therapeutic doses The symptoms were mostly of a mild nature but occasionally severe enough to make one pause sufficiently to select only those properly suited for this treatment

A ten per cent thallium cream had been used in hypertrichosis and sycosis, but an alopecia of the scalp frequently resulted with or without epilation of the area treated The ten per cent cream was considered too toxic Fifteen daily rubs of the one per cent formula of Sabouraud was given a trial in two patients with hypertrichosis, with entirely negative results

Ionization with a two per cent solution of thallium acetate was reported partially successful in hypertrichosis Those who used a 1 1,000 solution in this way were not in favor of it either for superfluous hairs or sycosis According to one observer, one-half of the usual dose of thallium and roentgen rays caused some epilation in sycosis barbae, but was accompanied by an alopecia on the scalp

There were two reports in the literature of cures with thallium in monilethrix Alopecia areata in children had also been treated with thallium, with good results It had also been suggested for other types of baldness on account of the seeming stimulating action of thallium on the growth of new hairs after epilation

Thallium treatment in fungus affections of the scalp was more economical when successful It was the method of choice in very young children and in those mentally or physically unsuited for the five-exposure method with the roentgen rays

Several observers had repeated the thallium when a failure resulted from the first dose of the drug, but it was a question whether this is an advisable thing to do, certainly not within the period of three months

Thallium should not be used at all after puberty A fractional dose of the drug combined with one-half of an epilating dose of the roentgen ray may be of use in fungus disease of the scalp in adults, especially for a still active favus with considerable scarring

Children in poor health or under weight and those with albuminuria, are not fit subjects for thallium treatment

20 Dixon, W E Meeting of the Section on Dermatology of the Royal Society of Medicine. Held March

sycosis is still in the experimental stage Those who were able and had the facilities to epilate with the roentgen ray would probably use the thallium method only in very young children with fungus disease of the scalp who did not lie quiet on the table for the five-exposure method The average practitioner might use it if he was beyond the reach of those who were capable to epilate with the roentgen ray It has its usefulness also in an asylum or hospital practice, especially where mental defectives or idiots were patients This was demonstrated by the report of Felden

A strong factor in the choice of treatment between the roentgen ray and thallium was the percentage of those cured with either of these methods Thallium treatment is much more economical if the treatment was successful While relapses do occur with epilating doses of the roentgen ray, they are uncommonly rare Even when epilation is incomplete, a cure is more often the result with the roentgen ray because regrowth is not so rapid, allowing more time for the local antiseptic treatment to reach those hairs still harboring the fungi In comparison the following figures are cited from a few who had complied some statistics of the results with thallium (usually with an 8 mg per kg dosage)

	Percent Cured	
Berde	79(?)	Total epilation
Cicero	66	This did not include those that were cured although epilation was incomplete.
Felden	76	
Lourier & Zwitkis	62	Favus
	51.3	Microspron.
	45.5	Herpes tonsurans
Mgeubroff & Landesmann	50	(Majority failures
Peyri	70	with 6 mgs per
Urueña	91	kg)

The results with the 8 milligram dosage per kilogram in the ten cases of tinea capitis treated with thallium at our clinic were also good—80 per cent The number of cures with this dosage may turn out to be still higher as two patients are still under observation, but the severe and incapacitating pains that affected one of our patients was sufficient in our opinion, to limit the treatment in the future to those only who were to be the object of further study of the action of thallium and those who were too nervous or too young to receive the five-exposure method of epilation with the roentgen ray The results were poor when a lower dose than 8 milligrams per kilogram or the combined method (with roentgen ray), was used

It is necessary to exert care with thallium dosage as it is necessary to be careful not to overstep the epilating dose of the roentgen ray, but there is no possibility of a permanent alopecia with thallium as with the roentgen ray Thanks to modern apparatus, this complication following the rays is becoming an exceedingly rare one. The question of any injury to the brain by an ordinary epilating dose of the roentgen rays has no basis in fact and could no longer be maintained as an argument against the use of the rays It is too early to say that thallium even in ordinary therapeutic doses has no lingering effects on the physical and mental habitus of some patients With few exceptions, therefore, the roentgen rays remain the method of choice for the treatment of fungus affections of the scalp

Summary and Conclusions—Thallium acetate (Kahlbaum's) was used in the treatment of eighteen cases of tinea capitis and one of favus.

Ten children with tinea capitis were treated with 8 milligrams of thallium acetate per kilogram of body weight All were cured with the exception of two still under observation One severe reaction occurred, incapacitating the child for three weeks

Epilation in these ten patients began on the average of fourteen days and was complete in twenty-two days The hairs began to regrow in thirty-six days, reaching a normal thickness in about three months after the administration of the drug

Three patients with tinea capitis were treated with 7 milligrams of thallium per kilogram of body weight with one cure and two failures Two other patients received a 6 milligram dosage per kilogram and both were failures The combined thallium and roentgen-ray treatment, using one-half of the required amounts of each, was ineffective in three patients in which it was used In all these instances, epilation began in the usual time excepting with the combined method where it was somewhat delayed Epilation was incomplete in all patients excepting the one that was cured with the 7 milligrams of thallium per kilogram of body weight Regrowth with incomplete epilation seemed to start earlier than usual

One woman, 41 years old, with favus of the scalp, was treated with 4 milligrams of thallium per kilogram of body weight Epilation was incomplete and she was incapacitated on account of fever, body pains and dyspnoea, for one week Regrowth of her hair began soon enough but the Achorion Schloenleinii was still present

Accurate weighing of the patient and also of the drug was a sine qua non of the treatment. A fresh and reliable thallium acetate was advisable to avoid any possible reactions The required dose was given by mouth, once only and three hours after a light meal

Active local antiseptic treatment and daily washings of the scalp, started before epilation, must be continued up to the time of regrowth of the hairs

Thallium defluvium is not as spontaneous as that following roentgen-ray treatment Epilation has to be hastened therefore by tweezers, plaster

In this country, from the earliest days, maternity care has been largely in the hands of the medical profession American women here, unlike those of foreign countries, have always looked to the medical profession for assistance during childbirth No doubt, this preference on the part of women for medical service has been to some extent responsible for our failure until recently, to develop any plan for the training of the midwife or nurse in this service

While there is a constant need and demand for medical care during childbirth, the number of physicians available for this care is rapidly diminishing The recent trend of the physician from rural communities to towns and cities, the development of other more desirable specialties and the decreasing number of graduates in medicine are important factors which must be considered in the problem of providing maternity care in the future It must be clearly understood that the medical profession in this country is not able to give individual care to every mother There never has been a time when this has been possible There is an urgent need for nurses and midwives trained to take care of normal patients for whom no physician is available

With the exception of the results obtained by those who have had special training in obstetrics and by large maternity hospitals, the loss of life among mothers and infants throughout the country is excessive Vital statistics of the Registration Area of the United States show a higher maternal and infant death rate than most of the other civilized countries, and almost twice that of many European States As each country has different laws relating to the reporting of deaths, many authorities in this country are unwilling to admit that the mortality rate is so much higher here than abroad Nevertheless, the statistics available do show that the mortality rate in the United States is much higher than in some foreign countries, especially the Scandinavian States We must conclude that the standard of obstetrical care which the majority of women in this country are receiving is not adequate to protect them from the dangers associated with pregnancy and childbirth

The present maternal mortality rate of 6 5 per thousand live births has remained practically the same for the past twenty years This seems almost unbelievable when we consider the progress made during this same period in medicine and surgery The mortality rate varies greatly in different States In States densely populated, with ample facilities for transportation, it is found to be lower than in States where the population is scattered over great areas with limited means of transportation, making it difficult and often impossible to provide obstetrical care in times of emergency In the Southern States, inadequate care of the colored women is largely responsible for the high death rate In some of these States the mortality rate among the colored women is 14 per thousand live births, or approximately the death of one mother in every seventy

The maternal mortality in the cities is much higher than that of the rural districts The average mortality rate for cities is 7 3 per thousand live births compared to 5 5 per thousand in rural districts The increased death rate from puerperal sepsis in the cities is responsible for the higher maternal death rate The death rate in the cities from sepsis is three per thousand live births as compared to 1 9 in the rural districts This is surprising when we consider the greater opportunities for medical and hospital care in the cities as compared to rural districts It is evident that since infection is associated with operative deliveries, there is less interference with labor in rural districts

The mortality rate is less in the large cities than in the small cities and towns This is due to better hospital facilities, and to the number of physicians restricting their practice to obstetrics in the larger cities The general hospitals in the small cities and towns have only in recent years begun to establish a maternity service independent of the medical and surgical services The maternity service of a general hospital is able to provide adequate maternity care only when that service is regarded by the hospital authorities as of equal importance to the community with the medical and surgical services, and when a physician specially trained in obstetrics is placed in control of the service With an increase in the number of properly organized hospitals the mortality in complicated cases will be reduced, and at the same time there will be greater opportunity for training physicians and nurses in obstetrics

Analysis of the maternal and infant deaths shows that more than half of them could have been prevented if proper medical care had been available Maternity care which will prevent excessive loss of life must be provided throughout pregnancy, during labor and for a period of about six weeks following labor

We find puerperal septicemia to be the cause of over 40 per cent of maternal deaths, and eclampsia of more than 25 per cent. These two conditions, accounting for over 65 per cent of maternal deaths, must have more attention from those who are interested in the practice of obstetrics Almost another 20 per cent of deaths are due to accidents of pregnancy and labor which could be greatly reduced by proper supervision

THE PROBLEM OF REDUCING MORTALITY ASSOCIATED WITH CHILDBIRTH*

By FREDERICK W RICE, M D, NEW YORK, N Y

From the Department of Obstetrics, New York University, and Bellevue Hospital Medical College

PRIOR to the seventeeth century the care of women during childbirth was entirely in the control of midwives Although physicians never assisted women during childbirth their writings show evidence of their interest in this subject As early as the second century the dangers and risks of pregnancy were appreciated by the medical profession Hippocrates and later Soranus, at the end of the first and the beginning of the second century, prescribed rules and instructions for the guidance of the midwife in normal as well as in obstructed labors Soranus and his followers at that period, were urging the preference of the trained midwife over the untrained in normal as well as complicated labor

The knowledge shown by Soranus on this subject has won for him the title of "Father Obstetrics" He was the first to advise version as a method of delivery in obstructed and complicated labors, a method which, undoubtedly, even in the hands of the midwives was a means of saving life For some reason version, after a century or two, disappeared from the practice of the midwives and was not revived until the seventeenth century when the development of modern obstetrics began

During the seventeenth century physicians were allowed the privilege of attending women during childbirth Once having gained the opportunity of acquiring experience in the care of women during labor, the principles of proper care based on a sound knowledge of anatomy and physiology, rapidly developed in the hands of physicians into the science of obstetrics Experience in the management of difficult labors led to the discovery of forceps and the revival of version, and brought about the art of obstetrics

Modern obstetrics was developed during this period by a few great teachers, who were really specialists, and very shortly it became recognized as a branch of medicine and surgery With its acceptance by the medical profession the subject was taught in the medical schools throughout Europe

During the eighteenth century great progress was made in reducing the loss of life during childbirth Maternity hospitals were established in connection with medical centers for the two-fold purpose of providing for women in need of special obstetrical care and of training medical students and midwives It was understood that while the midwife could be trained to deliver a normal case with some degree of safety, she could not be trained to care properly for the abnormal case

The cooperation of the State authorities with the medical profession enabled the training and control of the midwife to be accomplished The duties of the midwife during childbirth as well as her limitations were clearly defined and enforced by law The maternity hospitals established in connection with the medical schools were, and have continued to be, the great training schools for midwives as well as the medical profession

The mortality rate declined with improved training and control of the midwife At the present time, the mortality rate is lowest in those countries where the delivery of normal cases is almost entirely in the hands of the midwife In England, with the midwives in charge of only 50 per cent of the deliveries, the mortality rate is higher than in the countries on the Continent where midwives deliver 85 to 90 per cent of the cases

* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23, 1928.

obstetrics has been slow The period devoted to clinical teaching and experience in prenatal clinics, labor rooms and wards has not been sufficient properly to train students

It has been the practice in most medical schools to teach not only the fundamental knowledge necessary for the care of normal pregnancy and labor, but as far as possible the principles and technique of all operations which might be necessary for complications developing during pregnancy and labor It was hoped that the student would be able in active practice to develop sufficient skill to enable him to perform obstetrical operations without undue risk to mother and child

Our experience in teaching graduates and in caring for complicated cases referred to our maternity hospitals, has convinced us of the great danger in graduating men with the idea that they can obtain such skill without further training The number of graduates in private practice who acquire judgment and skill in managing complicated cases without special training in a maternity hospital is limited To obtain a high degree of skill in operative obstetrics, we believe the physician must have post graduate training and experience following sound training in medicine and surgery in a general hospital

While fundamental instruction in the theory of obstetrics is necessary for all students, the study of practical obstetrics in maternity hospitals should be required only of students who intend to practice obstetrics Such students should devote at least two months during their fourth year to training in a maternity hospital

The results in the future depend on an increase in the number of maternity hospitals Such an increase will make it possible for us to improve our knowledge of obstetrics by the study of a greater number of collected cases The mortality in obstetrics would be greatly lessened if the indications for operations were more clearly understood and the methods of treatment standardized as they are in surgery Too often the judgment of the obstetrician is based on his own results in a limited number of cases

Largely because of frontier conditions and a wide scattering of population, it has been impossible in this country for every mother to obtain the services of a physician Among the foreign groups, who have settled in various parts of the country, especially in the rural districts of the North Western States and in many of the larger cities, the women in many cases retain the custom of the homeland in employing midwives In the South the colored and, in many instances, the white women have made use of the untrained negro midwife Today it is estimated that about 40 per cent of the births in this country are in the hands of midwives It is safe to say that over 90 per cent of these women are untrained

We must find some means for training midwives who are now in practice, and those nurses and midwives who are to render this service in the future to women who are unable to receive care from physicians and maternity hospitals This can be accomplished as it has been in other countries, by the cooperation of those in the profession interested in teaching obstetrics in maternity hospitals with State and city health authorities

While this movement is well under way in some cities and States, it will make little progress without more interest and support by the medical profession It has been observed that the number of midwives is rapidly reduced whenever registration and regulation have been instituted With the reduction in the number of midwives it is noticed that the most intelligent and capable remain This elimination of the aged and unfit results in the immediate improvement of maternity care and a lessening in the difficulties of supervision and training

During the past ten years the New York State Department of Health has been active in improving the practice of the midwife, and as a result of their activities the number of midwives has been greatly reduced In 1916 midwives reported 16 13 per cent of the total births, while in 1926 only 7 09 per cent were reported by midwives

In New York City in 1909 there were 3,131 registered midwives, who reported 49,616 births, which was 40 per cent of the total registered Since that year, with better control and supervision, the number of midwives has been reduced to 1200 In 1926 they reported only 21,000 births, which was 16 per cent of the total

During 1911 a school for midwives was established in connection with the maternity service at Bellevue Hospital This was the result of the efforts of the Child Hygiene Department of the Board of Health It was organized to give midwives a training which would enable them to deliver normal cases Since 1911 only graduates of this school, or of schools abroad have been licensed to practice The school has been the means of training nearly five hundred women The course of training covers a period of nine months The student midwife, while under instruction, lives in the school, at the expense of the city She is required to observe eighty cases and deliver twenty during this time The majority of the abnormal cases are transferred to the hospital

Our experience in observing the work of the midwives under our supervision has convinced us that while the midwife can be trained to deliver a normal case, she is not capable of

The maternity care provided has a direct influence on the life of the child Where the lowered standard of care results in a high maternal death, we always find an accompanying high stillbirth and infant mortality rate

The presence of the doctor toward the end of labor is not sufficient protection for mother and child The best results of medical care are brought about by care during pregnancy because during this period it is possible to prevent complications or to recognize them at a time when treatment is most effective Syphilis and toxema are two conditions largely responsible for intrauterine and neonatal deaths When medical attention is provided during pregnancy syphilis can be eliminated and toxemia prevented or controlled Pre-natal care is our only means of reducing intrauterine deaths and prematurity Prematurity and birth injuries are the principal factors in causing the high infant mortality during the first month of life The infant death rate as a result of injuries, largely due to operative deliveries, is high and increasing each year Care during pregnancy is all important in increasing the number of normal deliveries, and lessening the number of operative deliveries

During the past twenty years great efforts have been made to reduce the mortality during pregnancy and labor by employing the methods used in the fields of medicine and surgery In surgery, mortality was reduced by showing the necessity for special training and the need for more hospitals to make more certain the results of proper technique, and at the same time to afford the opportunity for the special training of doctors and nurses In medicine, the mortality from disease was reduced by cooperating with public and private agencies interested in public health and the spread of knowledge covering essential principles of prevention The standard of maternity care would be greatly improved if the number of properly organized maternity hospitals could be increased and if the principles of prevention were appreciated and as widely carried out as they have been in the fields of medicine and surgery

Operative obstetrics today is no more advanced than surgery was at the beginning of the last quarter of a century The necessity for skilled assistance in difficult cases as a protection against unnecessary injuries and morbidity is not realized Although the need for a larger number of trained obstetricians is urgent, there is little or no demand for their services outside of the larger cities and in teaching positions in the medical schools and maternity hospitals

If there is to be any reduction in the maternal mortality rate, there must be a more widespread knowledge and a clearer understanding of the importance of the principles underlying proper maternity care The application of these principles in preventing fatalities as well as morbidity must be known to the medical profession and also to the public

In recent years a few States have been able to show a slight reduction in maternal mortality, and a large majority a noticeable reduction in infant mortality as a result of the activities of the various State and municipal health authorities, as well as the national and local private organizations interested in maternal and infant welfare Although these various activities have, unfortunately, accomplished little in reducing the maternal death rate, great progress has been made in arousing widespread interest in the subject which is essential for future efforts to be successful in finding a practical solution of this problem

We believe the solution of the problem lies in an improved teaching of obstetrics in our medical schools, and in a better training of students, graduates, nurses and midwives in maternity hospitals Obstetrics as an art and science must be elevated to an equal importance with medicine and surgery in medical schools and hospitals and no longer occupy a subordinate position More independent maternity hospitals should be established and general hospitals should be induced to maintain adequate maternity services with coordinated outpatient clinics Moreover, provision must be made for isolated areas where no hospitals exist, by the establishment of maternity centers and development of prenatal and postpartum clinics In addition, the work of existing prenatal and postpartum clinics should be extended to include patients other than those registering for care during delivery

Since maternity care is essentially medical care, the responsibility for improving this care rests largely with the medical profession The most important factor in elevating the standard of care is the thorough teaching of clinical obstetrics in medical schools and maternity hospitals It has been only during the last quarter of a century that medical schools have been able, through affiliation with maternity hospitals, to teach students and train graduates in practical obstetrics

Before this time, because of the small number of hospitals, there had been little or no opportunity properly to teach obstetrics The few maternity hospitals in existence were used for the care of complicated cases There was no provision in these hospitals for the care of normal pregnancy and labor, or for training students and graduates in the essential principles of prenatal care

Because of the limited time available for clinical teaching, the improvement in teaching

ritory These centers should be oganized by the communities, and the State and county should assist in their support. The public health nurse with special maternity training should live at the center and be supported by the center

The problem of reducing the mortality associated with childbirth is a complicated one and dependent for solution on many different factors

In the application of many of the remedies suggested there will of necessity appear minor difficulties which will have to be smoothed out to pave the way for future success Real progress will only be assured through the cooperation of all classes herein discussed and through the appreciation of the great need of solving this problem which is so vital to the womanhood of this country

---

EXPERIENCES IN THE MANAGEMENT OF PREGNANCY COMPLICATED BY HEART DISEASE*

By HAROLD E B PARDEE, M D., NEW YORK, N Y

WHETHER or not to allow a woman with heart disease to go through pregnancy depends upon a prognosis It demands a decision as to whether or not the heart will be able to supply blood for the physical demands of the later months of pregnancy and especially for the more strenuous effort of the hours of labor

In the past the diagnosis of the anatomical lesion has been used as a basis for this prognosis, but to judge from the results it is not a reliable basis Mackenzie pointed the way to a better understanding of the problem by focusing attention upon the symptoms and signs of failure of the heart to maintain a normal circulation His observations and suggestions[1] published in 1921 were the first direct word from the internist to the obstetrician indicating the marked change in viewpoint which the modern ideas of cardiology have produced

The prognosis for pregnancy depends upon the functional cardiac diagnosis and this centers upon the patient's ability to perform physical exertion rather than upon the pathological state of the valves or myocardium

In this country and particularly in New York City, the idea of determining the limitations of the patient's heart by observing the reaction to physical exercise had obtained a firm hold, and in 1922 it was possible to give the results of two years experience with a functional classification of women with heart disease which it was hoped would indicate their fitness for pregnancy[2] This classification depended upon three factors First that the patient definitely had organic cardiac disease, Second the ease with which unusual shortness of breath or palpitation developed after exercise, Third the observation of the patient's reaction to a rather strenuous test exercise given by the physician

This preliminary report suggested that the method had some value, as there was no instance of cardiac failure developing during pregnancy or labor in patients of the two groups considered most favorable The experience of the last seven years has continued to show the value of a functional rating of the patients with heart disease A functional classification has been introduced under the auspices of The New York Heart Association, and this classification has come to be widely used in many parts of the country It seemed inadvisable to have a different classification for those cardiac patients who were pregnant and so the classification of The New York Heart Association has been used in our antepartum clinic at the Lying In Hospital since 1924 This classification does not differ in principle, but only in the number of groups, from the one which I suggested in 1922 Patients with organic cardiac disease are divided into four classes according to their cardiac functional capacity

Class I—Those who are able to perform ordinary and usual physical activity without unusual fatigue, palpitation or dyspnea

Class IIa—Those who are able to perform the usual normal physical activity but who have discomfort in so doing Such a person would have noticed an increase in shortness of breath after climbing stairs or after walking against a wind or up grades or after such things as housecleaning or lifting heavy articles These patients would by some be said to be "fairly well compensated"

Class IIb—Those who are unable to perform the more difficult features of ordinary physical activity without stopping on account of fatigue, shortness of breath or palpitation Such activities would be climbing two flights of stairs or walking at an ordinary rate for a half mile These patients might be called "somewhat decompensated"

Class III—Those who are unable to perform the simplest physical activity without fatigue or shortness of breath or palpitation Such a patient would be unable to walk 200 or 300 feet or to climb one flight of stairs without

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y, May 23 1928

being trained to give adequate prenatal care. Nevertheless, she can be taught the principles of hygiene of pregnancy and the recognition of early signs of complications

Since 1911 the midwives at the school have delivered 13,762 women, 133 of these were transferred to Bellevue for hospital care There were only 11 maternal deaths and 4 of these occurred among the cases transferred to the hospital The maternal death rate was only 75 per thousand live births, the stillbirth rate was 1 77 per cent, operative delivery by forceps only 2 32 per cent These remarkable results, we feel, are due to the pre-natal care and supervision during delivery by the medical staff connected with the maternity service at Bellevue Hospital

As a result of State registration of midwives and on account of restricted immigration the need and demand for midwives will rapidly decrease except possibly among the rural colored population of the South

As long as there is any demand for the midwife, we feel that greater effort should be made to replace the untrained women with trained midwives We believe that we should train the public health nurse in obstetrics so that she may supervise and instruct the midwives in active practice, and in isolated districts be able to supplant the midwife when physicians are not available

After nearly twenty years of teaching obstetrics in maternity hospitals we feel that more attention must be paid to the training of nurses, both student and graduate It is believed that the period of training for the student nurse should be increased The present average period of three months is inadequate We cannot expect the nurse to be trained properly in the principles of labor and the care of the mother and newborn child in such a short period of time

The obstetrician in charge of the maternity service must take a more active part in the clinical teaching of nurses, as well as of the graduate physicians on duty in the hospital Too much of the training period of nurses is devoted to the study of the theory of obstetrics There should be more clinical instruction and the student should have more time to observe patients during pregnancy, labor and the puerperium We are graduating each year nurses who are not trained to care for the ordinary obstetrical case The training to assist at delivery is today considered of more importance than the intelligent observation and care of a patient during labor

Because of lack of training only a limited number of nurses are willing to do obstetrical nursing They do not have sufficient practical training to give them confidence The small number of competent obstetrical nurses available today are the nurses who have had unusual opportunities to be trained by physicians in their practice or who have had opportunity to obtain extra experience as head nurses in maternity hospitals

It is believed, if the course in obstetrical nursing could be extended to six months that nurses would be more willing to care for obstetrical cases and would be of much more assistance to the doctor By their trained supervision they could keep the attending physician informed as to the progress of the case and report the appearance of untoward symptoms and intelligently carry out his instructions In this way, they would be of greater value to the woman during labor and would save the time of the busy practitioner for other work The tediousness of waiting is one of the disagreeable features of obstetrics which makes men in general practice give up obstetrics or turn to operative means of delivery, thus increasing the risk when no interference is indicated

A six months' post graduate course in a maternity hospital with a home service should provide the graduate nurse with sufficient experience to teach and supervise midwives in the care of normal cases A nurse so trained will be able to care for the patient during normal labor and to recognize complications when they develop The graduate nurse with this additional six months' training would be invaluable in rural communities as a public health nurse in connection with a maternity center This nurse would be able not only to provide prenatal care under limited medical supervision but also, if necessary, conduct confinements and care for women during the puerperium

During the past four or five years at the Manhattan Maternity Hospital we have been able to provide a small number of graduate nurses with special obstetrical training for public health and missionary work The work of these nurses has demonstrated that the specially trained nurse is qualified to take the place of the midwife and competent to provide adequate maternity care for normal cases under limited medical supervision in isloated districts where the number of physicians is not sufficient to provide this care We hope to be able to give this training to a larger number of nurses in the near future both at Manhattan and Bellevue Hospitals

The small towns and cities will be able to care for abnormal obstetrical cases by developing maternity services in the local general hospitals The rural sections in isolated areas without sufficient medical protection, should have small maternity hospitals which would be maternity centers for the surrounding ter-

Of the 75 patients diagnosed as Class I, sixty entered the hospital for delivery There was no record of cardiac embarrassment during labor One of these Class I patients died of pneumonia following a Caesarean operation This patient did not enter the hospital until labor had been in progress 32 hours A hysterotomy was promptly done and the child found dead No evidences of cardiac embarrassment were observed either before or after the operation She developed pneumonia on the day after the operation and died on the fifteenth day

Of 19 patients diagnosed as Class IIa, 12 entered the hospital for delivery Five of these went through perfectly uneventful labors without noteworthy acceleration of the pulse or respiration Three women showed slight pulse and respiration increase during and after labor with a varying amount of subjective dyspnea All, however, made a prompt and uneventful recovery usually within twenty-four hours One of these, para IV after twenty-six hours in the first stage, and two hours in the second stage, showed a pulse of 108 and respiration 22, with no subjective dyspnea Another, a para V had five hours of first stage and 35 minutes of second stage She had a pulse of 118 and respirations 24 and complained of slight subjective dyspnea The other, a para II, breech delivery, had three hours and a half of first stage and fifty minutes of second stage The pulse was 120, the respirations 22 and she complained of slight dyspnea

Three were helped through the second stage by forceps after a long first stage, but showed no especial evidence of cardiac embarrassment. One of these, para II, after 25 hours first stage and two hours second stage and a median forceps application, showed the pulse 104, respiration 22, another, para I, after 15 hours first stage, four hours second stage and a low forceps application, showed pulse 100, respiration 20, the third, para I, after 16 hours first stage, one-half hour second stage and a median forceps application showed pulse 100, respiration 20

One woman with moderate nephritic manifestations, and hypertension as well as mitral stenosis had a spontaneous premature delivery at the sixth month and during this showed the pulse 120, and respiration 28 with some dyspnea In about 36 hours the pulse and respirations had returned to normal and she made an eventful recovery Another, a para XII, after a short labor without unusual pulse or respiratory accelleration showed fever for a week and had occasional attacks of cyanosis and weak pulse during this time A definite diagnosis was not made but pulmonary embolism was suspected

One patient was delivered at another hospital* She entered in labor and after a low forceps application was delivered of a four pound baby The pulse and respiration were only slightly accellerated and she seemed in good condition She had, however, cough and some dyspnea at night for a few days but improved and was allowed up in a chair on the tenth day postpartum Next day she complained of a pain in the right leg and six days later gangrene of the leg was diagnosed and the leg was amputated for embolism of the popliteal artery She did not make a good postoperative recovery and died on the twenty-sixth day postpartum

Of eleven patients diagnosed as Class IIb, nine entered the hospital for delivery Three of these went through without event, another had slight cardiac embarrassment She was a multipara with 27 hours in the first stage and two hours in the second, who showed the pulse 105, and the respiration 24 with slight subjective dyspnea She made a prompt recovery however and was discharged in good condition Another, after nine hours in the first stage and a version and breech extraction, showed no cardiac embarrassment but had postpartum hemorrhage with a pulse of about 100 for three days

Two patients diagnosed as Class IIb in the clinic were later admitted to the hospital severely decompensated, (Class III) one in the fifth month of pregnancy, the other in the third month Both improved somewhat with rest and digitalis The first patient who had entered with marked pulmonary congestion was operated on after fourteen days of treatment Hysterectomy was followed by death on the 2nd day The second patient who had entered at the third month of pregnancy with only slight pulmonary congestion, had a hysterectomy on the ninth day and made an uneventful recovery

Two patients were delivered by the Caesarean operation one after eighteen hours and the other after 24 hours of labor without progress Both of these showed slight signs of circulatory embarrassment in an increase of pulse to about 120 and of respiration to 28

Reviewing the results with these patients we find that the only deaths from heart failure occurred in the patients of Class IIb or Class III The death in Class IIa was also a result of the heart disease and probably would not have occurred if she had not undergone the pregnancy The death in Class I was a postoperative pneumonia and probably did not bear any definite relation to the heart disease

Half of the twelve Class IIa patients went through labor with only the slighest signs of

*The Lebanon Hospital, whose superintendent, Mr G. E. Halpern kindly allowed the chart to be abstracted.

resting, and would be unable to do any housework These might be said to be "much decompensated" or "definitely decompensated"

We have attempted to classify our antepartum cases along these lines using the patient's history of her ability to exercise as a guide and checking our rating by the observed reaction to a test exercise when the patient's history seemed unsatisfactory Due allowance must be made for the normal limitation of ability to exercise which comes with pregnancy The sickness of the early months may give rise to exhaustion and rapid pulse In the later months there will be a shortness of breath on climbing stairs not usually preventing the woman from climbing two flights, but making a pause necessary on the third flight In doing her housework she finds it necessary to slow her pace somewhat

Allowance must also be made for the fact that edema of the legs need not be due to heart disease Many women whose hearts are normal show this during pregnancy

In rating patients on their cardiac ability not only must these usual limitations of pregnancy be allowed for but also the individual variation found in different women Some undertake physical effort with greater facility than others Some women never can do much in the way of exercise but careful inquiry will discover that it is a sense of fatigue rather than shortness of breath which limits their ability In the absence of other signs this is not a symptom of cardiac failure

The test exercise is of considerable help in doubtful cases allowing the patient to swing a 10-pound dumb-bell, or a 5-pound dumb-bell, if she is not well developed physically, from between the legs to straight overhead She should do this 20 or 25 times, under her physician's observation and he should note the pulse rate and appearance of dyspnea directly afterward A normal reaction will consist in a moderate amount of dyspnea and tachycardia which will subside in a minute or two If the patient shows marked dyspnea or tachycardia the reaction is excessive and she should be classed as IIa or IIb If the patient cannot perform this exercise on account of palpitation or dyspnea the reaction is so excessive that she should be classed as IIb A Class III patient would probably not be able to perform more than 5 or 6 swings of the dumb-bell, but as a rule a test exercise is unnecessary for the functional diagnosis of a Class III patient The subjective complaints and the appearance are usually sufficient

I wish at present to report upon the results with a series of 106 patients seen in the antepartum Clinic of the Lying In Hospital, between July, 1923 and July, 1925 All of them except two had rheumatic valvular disease and these two had congenital cardiac abnormalities Twenty-nine were diagnosed as having mitral insufficiency Sixty-four were diagnosed as having mitral stenosis Eleven had aortic insufficiency and three of these probably mitral stenosis as well One of the congenital cases was thought to have patent interventricular septum, the other potent ductus arteriosus The functional classification of these patients is shown in Table 1 Seventy-five were diagnosed as Class I, twenty as Class IIa and eleven as Class IIb In addition to these 106 patients who were followed from the antepartum clinic, there entered the hospital during this two year period, six other patients with heart disease in a seriously decompensated state, three of them with pulmonary oedema These were Class III patients, five with mitral stenosis and one with aortic insufficiency These patients appear in the last column of the table The mortality in this group is striking but the fact that three of these patients entered with such marked congestive heart failure that edema of the lungs was present shows a reason for this Had these patients been under antepartum observation it should have been possible to prevent their heart failure reaching such a severe grade Their lives might have been saved and possibly also those of their babies

Cardiac enlargement has been emphasized by some as an important feature for deciding upon the functional ability of the heart and especially the ability of the patient to withstand the strain of labor From this series it seemed to be of some importance (Table 2) for cardiac enlargement was more than slight in eight (73%) of the eleven patients who were rated as Class IIb, and who were definitely limited by shortness of breath and in only twelve (18%) of the 64 patients who were rated as Class I, and who had no symptoms referable to their heart Class IIa patients who had slight symptoms of cardiac insufficiency showed definite cardiac enlargement five times in nineteen patients (20%)

It will be seen from Table 2, however, that enlargement is not a reliable guide There were two patients with marked cardiac enlargement and this means the apex beat almost at the anterior axillary line, who yet had no symptoms referable to the heart (Class I), and ten patients with moderate cardiac enlargement were also in this category

The experience with this series gives added weight to the idea that a functional diagnosis of the cardiac patient is the most satisfactory available guide to the prognosis for pregnancy To show the reasons for this it will be necessary to review in detail the case histories of the patients who died and in general the histories of those in the four functional groups

PAPILLOMATOSIS OF THE LARYNX AND TRACHEA*

By ARTHUR F HOLDING, M.D, ALBANY, N Y

MY experience with cases of papilloma of the larynx leads me to believe that our knowledge of these cases may be divided into three stages — the bronchoscopist goes through these three distinct stages in the development of his understanding of this condition

The first or *papilloma* stage may be called the pre-bronchoscopic stage, before the bronchoscopist becomes a bronchoscopist (the mirror stage of indirect laryngoscopy when he laryngescopes only adults) when he believes that papilloma of the larynx presents as a single lesion in an adult larynx.

The second or *papillomata* stage, or early bronchoscopic period when he recognizes that papillomata more commonly presents in children than in adults, and occurs in a multiple form

The third, or *papillomatosis* stage, or later bronchoscopic period when he recognizes that the lesions are not confined to the larynx, but frequently extend beyond the larynx, and are often found in the trachea and bronchi

Furthermore, we are strongly impressed by the fact of our dependence on the sense of sight for the diagnosis of papillomatosis Its diagnosis by any other sense that that of sight is merely a lucky guess

Since the beginning of man, papillomas have been known, commonly as the humble external member of that family, the wart.

As our experience has widened and our fields of vision have been enlarged by the various "scopes" that have been invented, we have found more and more of the papillomata family tucked away in unexplored portions of the body

Their presence on the ectoderm were ever obvious, but their discovery in the entodermic areas has been entirely dependent on application of the sense of sight to these internal areas

With the discovery of the microscope, and the increased study at autopsies, we found many unsuspected internal papillomata The indirect laryngoscope revealed papilloma of the larynx; the proctoscope revealed papillomata of the rectum and colon, the cystoscope popularized papillomata of the bladder in medical literature, and the bronchoscope showed the full extent of papillomata of the larynx, showed their occasional presence in the trachea and bronchi, and I venture to predict that frequent case reports of *papillomatosis* in larynx, trachea and bronchi will soon appear in medical literature

Careful search has proven that whereas in the past we were satisfied with a diagnosis of papilloma—later with a diagnosis of papillomata, but that now thorough bronchoscopic search frequently reveals papillomatosis

Papillomatosis of the internal organs *without symptoms* is usually overlooked in life, and only discovered at autopsy, papillomatosis of internal organs *with symptoms* is almost invariably diagnosed as some malignant or incurable disease until the papillomata are visualized and then the sense of sight lets in understanding, dispels mystery, routs fear and makes apparent the benign nature of the lesions

I would suggest that possibly the fact that few cases of papillomata of the larynx come to autopsy explains the few cases of papillomatosis of the larynx and trachea that have been reported

The routine bronchoscopic or direct laryngoscopic examination of "asthma" cases will prove some of these to be papillomatosis, and now that bronchoscopic work is being done so much more generally, the incidence of papillomata will be higher than previously reported

When this is done, perhaps the incidence of papillomata in children will be found to be greater than Rosenberg's figures of 16 cases among 5808 children under 13, Schrotter's figures of 10 cases among 7324 children under 10, and they will more nearly approach the Massachusetts General Hospital figures of 1 1000 in children under 14

The importance of recognition of cases of papillomatosis is emphasized by the statements of Crowe and Breitstein,[1] who say that while laryngeal papilloma in children is rare, it always causes death eventually, either by suffocation or by fibrous stenosis of the larynx unless treated early and intelligently They consider that the mortality rate of papilloma of the larynx in children under five is equal to, if not greater than that of carcinoma of the larynx in adults

The treatment of papilloma of the larynx is extremely unsatisfactory Jackson, Tucker, Crowe and Breitstein agree in favoring endo-laryngeal removal, but as the growths almost invariably recur, the operation must be repeated many times over a long period to effect a cure. This frequently wears out the patience of the parents, the patient and the operator

Because of the uncertain and generally poor results of surgical removal, many workers have tried cautery, desiccation (mono-polar high frequency), diathermy, x-rays and radium

Cauterization almost invariably leads to fibrous stenosis of the larynx.

Radium and x-ray have been used in many cases, rarely with good results, mainly because the papillomata persist after radio-active dosages sufficient to cause serious tissue destruction of the skin overlying the larynx, or destruction of cartilaginous and other parts of the larynx have been given

Inhibitory dosages of radio-activity are of problematical value—they are therefore unsatisfac-

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y., May 23, 1928.

cardiac strain as did five of the seven uncomplicated Class IIb patients No patient diagnosed as Class IIa in the clinic entered the hospital severely decompensated as did two of the Class IIb patients The two patients who had the Carsarean operation had a long period of labor before it in each case and they stood the operation very well indeed In one case the operation was done under local anaesthesia

There was a striking difference between the reaction of the women in Class I and those in Class II a and b The Class IIa patients appeared to have less cardiac distress on the average than did those in Class IIb, but individuals in either group showed so little reaction to the labor that it was hard to feel that their cardiac condition was variably severe

One great difficulty in predicting the effect of labor lies, as has been said before,[3] in our inability to predict the duration and severity of the strain of labor With a short first stage and a short second stage, perhaps assisted by a low forceps application, there may not be much physical strain imposed on the heart A much weakened heart might withstand a short second stage successfully and a less weakened heart fail during a long one

The seriousness of the occurrence of severe cardiac failure during pregnancy or labor is evident from the fact that of six patients in this condition, two died The best treatment of severe cardiac failure is prevention and this means keeping watch during pregnancy for the appearance of increasing cardiac difficulty, appropriate treatment of the heart as soon as this is discovered and the interruption of pregnancy if the heart fails to respond to treatment after two or three weeks If the woman goes into labor and during labor shows a pulse of 115 or respirations of 28 with subjective dyspnea or both of these, the condition should be considered as an emergency and any appropriate means applied to expedite delivery In each case the obstetrician must decide what will combine the utmost speed with the minimum of cardiac strain If an anaesthetic is necessary, gas should be especially avoided, for this increases cyanosis and thus aggravates one of the symptoms of heart failure Chloroform or ether are very well borne

As a method of interrupting pregnancy, the Caesarean operation has seemed to produce very little additional heart strain and to be preferable to hysterectomy from this view point. This is especially so if the operation can be done with local anaesthesia

On the whole the grouping of these patients according to cardiac functional capacity seems to have distinct value in helping to give a prognosis for pregnancy A Class I patient will not be expected to give trouble from cardiac insufficiency A Class IIa patient will probably not give trouble and there is a fair chance that a Class IIb will do so The management of the Class III group is extremely difficult and the mortality is high The main object of our antepartum cardiac observation is to prevent the patient ever becoming so severely decompensated as to fall into this group

TABLE I

until about three hours later when he commenced to develop signs of pulmonary oedema, which rapidly grew worse and the patient died about one hour later

An autopsy was performed and an interesting condition of papillomatosis was found, not only involving the larynx behind the vocal cords, but also extending down the trachea beyond the bifurcation *The papillomatosis was most marked all around the tracheotomy wound*

Polymorphous leucocytes abundant in capillaries and in alveoli Megakaryocytes found in some capillaries Catarrhal bronchiolitis present. The infection present is undoubtedly a terminal event

The growths in trachea are of papillary type, a hyperplastic columnar epithelium growing on narrow fibrovascular stalks—two to three cells in thickness A mild chronic inflammation in adjacent mucosa and in tracheal gland, but no invasion of epithelium

A—Tongue. B—Larynx C—Papillomata.

Larynx, trachea and bronchi opened from behind showing multiple papillomata extending from the pyriform sinuses to bronchi Upper arrow points to large growth at site of old tracheotomy, lower arrow indicates where a mass of papilloma had broken off

Necropsy report by Dr Victor Jacobson

Anatomical diagnosis—multiple papillomata of larynx, trachea and bronchi

Microscopical diagnosis—papillomata of larynx and trachea Oedema of lungs with early broncho-pneumonia

Photograph shows distribution of cauliflower-like growths in larynx, trachea and bronchi The polyps are friable and pieces easily break off They vary in size from 1 mm to 1½ cms at base The largest in middle of anterior wall of trachea around the tracheotomy wound and a similar mass of about same size 2 cms below this mass, but the latter was broken off in handling The base shows no infiltration of mucosa The growths are reddish but show no definite bleeding points The largest mass in the middle of anterior wall of trachea is at the site of an old tracheotomy wound There is a slight suggestion of cicatrix formation near right true vocal cord, but both true and false cords are still present

LUNGS—Marked oedema and congestion with much intra-alveolar hemorrhage in many parts

Conclusions

I Papillomatosis is more frequent than generally supposed, and with the perfected methods of direct examination many cases of supposed asthma, mediastinal tumor, etc, will prove to be papillomatosis In every condition recognized as papilloma of the larynx, it must be borne in mind that it may be a case of papillomatosis

II The treatment is unsatisfactory, and the majority of cases die

III The most satisfactory treatment is endolaryngeal removal with adjuvant treatment of inhibitory doses of radium and r-ray

IV The present case illustrates the possibility of transplantation of growth and stimulation of growth by chronic irritation

tory, and their value often overlooked, nevertheless they have real value Doses destructive to the intrinsic or extrinsic structure of the larynx are self-condemnatory

I agree that endolaryneal removal is the treatment of choice with *x*-ray and radium in inhibitory (not destructive) doses as adjuvants, but this treatment leaves much to be desired

To illustrate the problems presented in papillomatosis, I wish to report the following case

HISTORY In August, 1924, the patient, a first-born child, 18 months of age, suffering from dyspnoea and cyanosis, was referred by Dr Dean, Bennington, Vt, to Dr L W Gorham, Albany Father was dead, mother living and well, a French woman After the father died, the mother married again—an Italian, and a child born subsequently was normal, disproving any hereditary predisposition to papilloma on mother's side (The nationality and languages spoken by the stepfather and mother are important for a study of a motor-speech development phenomenon recorded later in the history)

Dr Gorman referred the case to me for further examination to determine the cause of the obstructive breathing

On admission to the Albany Hospital the child presented the clinical picture of a mediastinal tumor and a grave prognosis was given He was cyanotic, and could only breathe in the erect posture, using all his auxilliary respiratory muscles There was marked retraction of the suprasternal notch, the supra and infra clavicular fossæ at each attempt at inspiration No inspiratory "wheeze"

An *x*-ray examination made by Dr William P Howard showed normal chest and mediastinal outlines and no evidence of mediastinal tumor or foreign body, either opaque or non-opaque to the *x*-rays

A bronchoscopic examination showed a typical picture of laryngeal papillomata, and a bronchoscope was passed removing a plug of intralaryngeal papillomata

Up to this time the child had never been able to make any articulate sound, although he made attempts to phonate, the sounds he made were hoarse and only his mother could understand, and she could not translate them, so that we are of the opinion that she interpreted his wishes rather than his words, and she was evidently trying to prove that her offspring was not mentally defective, inasmuch as he had never been able to speak although 18 months old

As soon as the bronchoscope was passed, reaming out the papillomata, the child was relieved of his dyspnoea, and seeing his stepfather down the corridor, he pronounced his first articulate word, calling his stepfather by name The child then talked a great deal in the three languages that he was accustomed to hear, none of which he had been able to speak before After "scalping" of the papillomata, he jabbered in French, Italian and English, apparently at will

Following the teachings of Jackson, the bronchoscope was passed at intervals frequently enough to remove obstruction to the breathing and phonation The child grew and developed, and was particularly strong, active and intelligent.

After these repeated bronoscopic manipulations, covering the period between August, 1924, and February, 1925, we decided that we were getting tired of the prolonged treatment, which relieved the symptoms, but accomplished no permanent cure We also felt that the parents were getting restless, and wishing to secure for the child the best service that skill could afford, we referred the case to Dr Chevalier Jackson of Philadelphia, and the patient was admitted to Jefferson Hospital on Dr Jackson's service

At the time Dr Jackson first saw him, the dyspnoea was quite distressing, and he performed a tracheotomy at once and continued the treatments by bronchoscope at the Jefferson Hospital for a period of about nine months, the patient wearing a tracheotomy tube all this time.

In December, 1925, the case was referred back to us by Dr Jackson with the tracheotomy tube in situ, and monthly bronchoscopic treatment was advised

The patient reported to us once in July, 1926, and then did not return until December, 1926, which means that during that time the patient had no dyspnoea and the parents neglected his treatments He was admitted to the Cohoes Hospital in December, 1926, under the service of Dr Frank M Sulzman, for whose cooperation in this special line of work we are very appreciative and grateful

With Dr Sulzman the monthly bronchoscopic removal of papillomata was kept up At times we attempted to hasten the recovery of the case by implanting radium seeds, which notably improved the condition, retarded recurrence, but did not prevent recurrence The bronchoscsopic removal was done regularly each month from December, 1926, to the time of the patient's death, September 28, 1927

We had operated with no anaesthetic at first, but in January, 1927, commenced to use rectal ether with much better results for all concerned On the whole, this form of anaesthetic was most satisfactory, saved the patient, operator and assistants much struggling, and materially aided in the case and thoroughness of treatment

The treatment was apparently so satisfactory that we were beginning to consider decannulating the case, as he had worn the tracheotomy tube for nineteen months, and seemed to be breathing without difficulty

On September 28, 1927, the patient was bronchoscoped as usual, and without any prolonged or unusual manipulation He was returned to his bed and nothing unusual was noticed

some physicians the old idea that—COH and its restrictions is all that counts—still exists

Accuracy in diet regulation is needed as much as ever, if not more so particularly in cases in which insulin is used, because all diabetics need diet regulation but not all diabetics need insulin, but where insulin is used the successful treatment means insulin plus strict diet regulation and accuracy It is quite apparent therefore, that the diet scale is one of our most important therapeutic adjuncts

Every physician should be able to figure a diet in grams of COH, PROT, and total CALORIES, and unless he can do this he should not treat diabetics He sets a poor example by his uncertainty, lack of precision and definitness in his instructions to his patients He invites indiscretions in his diet and thus the patient develops a careless disregard in the choice and makeup of his diet The seriousness of the problem is entirely lost

We must recognize more than ever the influence of the law of total calories in the diet. We must discard as obsolete the old idea that all that counts is the COH in the diet and by restricting only COH in the diet, feed diets high in total calories (rich in fats) The literature is full of evidence of the influence of total calories and undernutrition in the treatment of diabetes mellitus Many investigators have come to the conclusion that the total calories is really what matters and that diets low in COH and high in fats serve no particular advantage, are unpalatable, are poorly tolerated by the patient and are dangerous in that they invite acidosis The diet low in fat and high in COH with moderate PROT allowance is the safest bet and serves the patient's best interest

We should not hand out stock diet charts with or without insulin, because every case is an individual problem and as such must be worked up individually His tolerance must be determined so that all the essential factors of age, weight, occupation, daily requirements together with the physical findings and other findings peculiar to his case are considered in the final diet regulation and treatment

Insulin should be used in those cases who cannot gain tolerance on an adequate diet and in complications and acidosis of course But to give insulin in any uncertain manner with any manner of unregulated diet or to give it just to fatten up diabetics is contrary to all the fundamental principles of the treatment of diabetes, and certainly invites trouble Patients thus irregularly treated will have fluctuating blood-sugars and become very careless and usually get into serious trouble and difficulties

It has never been definitely proven that a unit of insulin will cause to be burned any definite number of grams of COH, and therefore, neither the diet nor the urine supplies any regular basis for determining the dose of insulin To determine the dose of insulin, we should give it, and in the giving determine the dose and requirement according to the addition to the diet of COH, PROT and CALORIES in the form of fat. High fats in a diet require more insulin, further impressing us with the rule of TOTAL CALORIES, being all important, and that COH is not all that matters

The dose of insulin is that amount which will keep the patient sugar-free and maintain at all times as nearly as is possible a normal blood-sugar Frequent blood-sugar determinations are, therefore, desirable despite sugar-free urines

Insulin may be administered in various programs and need not always be given before meals Each case may be regulated and have a program established to suit his own needs Allen's famous early and late program (in which insulin is given an hour before breakfast and before or after lunch and from one to three or more hours after supper) is a beautiful example of how certain types of cases may be controlled and regulated in order to avoid hypoglycemic or hyperglycemic fluctuations Each case should be regulated to its own needs

In the case of the obese patient the concensus of opinion is to begin with a strict diet low in calories with plenty of bulk to satisfy the appetite, to bring down the weight and keep the blood-sugar normal Undernutrition improves tolerance Insulin is not indicated in this case

In the patient of average weight the diet should be low in total calories so that he is maintained slightly underweight in order to receive the benefit of undernutrition and thus avoid insulin Then he can go on a maintainance diet and his blood-sugar kept normal If the blood-sugar is high or permitted to rise the patient is losing tolerance and will need insulin

In the emaciated patient with active diabetes we may start right away with insulin and a diet calculated to bring the patient to normal or nearly normal weight, watching closely all the time, and balancing our insulin dosage with the diet so that normal blood-sugars are maintained and the desired weight reached We can start with a small dose once, twice or three times per day before meals or use the early and late program or any other program that will give us our desired results, viz

1 Constant sugar-free urines
2 Normal blood-sugars
3 Normal or nearly normal weight
4 A state of apparent normalcy in which the patient may carry on his daily routine duties

CONDITIONS IN THE TREATMENT OF DIABETES MELLITUS BY THE GENERAL PRACTITIONER*

By CHARLES M LEVIN, M D, RICHMOND HILL, L I, N Y

THERE has appeared within the last few years so much in the literature on the brilliant results obtained in the treatment and management of diabetes, as to leave little to be added by the general practitioner Yet the question of the practical treatment of this disease has become a greater problem to him today than ever before, in view of the many theories and innovations advanced for the successful treatment of this condition

In a recent article Dr E P Joslin said, "Instead of a half to a million, there must be a million to a million and a half diabetics in the country today There are many more than formerly, first, because they live longer—It will take years to determine whether the number of fresh cases of diabetes is actually increasing apart from the increment of the increase due to better medical diagnosis In a second, but indirect way the increase in the number of diabetics is shown by the average age at death"

When the diabetic or suspected diabetic presents himself to the general practitioner, the physician has two courses open, one, to treat the case, the other to refer the case to a diabetic specialist or to a metabolic clinic If the physician chooses the latter course it is but a temporary respite because the patient, after being straightened out and regulated on a definite program will be sent back to his physician for follow-up treatment and observation It is quite essential, therefore, that the practitioner recognize certain fundamental and definitely established facts in order that he may be prepared to successfully treat his diabetic

Everyone will agree that the treatment depends entirely upon strict diet regulation with or without insulin, regardless of the severity of the case Most cases of diabetes are mild and can be controlled by strict diet regulation and do not need insulin Dr F M Allen says—every case of diabetes can be controlled and maintained without downward progress and without any deaths occuring on account of diabetes

The patient must be so regulated as to be continuously sugar-free and to maintain without irregularities and fluctuations, at all times as nearly as is possible, a normal blood-sugar No hard and fast rules exist in the treatment of diabetes No right or wrong prevails There are several established and recognized courses of treatment such as the methods employed by Banting, Allen, Joslin, Sansum and others The general practitioner has the preference and it is up to him to use whatever method or combination of methods he may choose as long as the best results are obtained and the patient's best interest served

In general practice there are usually three types of cases (except the emergency and complicated case) that the physician is called upon to treat.

1 The obese patient with a tendency or beginning diabetes

2 The patient of average weight with diabetes

3 The emaciated patient with active diabetes

When undertaking the treatment of these cases we should bear in mind the following established observations

The successful treatment of diabetes mellitus depends upon strict diet regulation with or without insulin There still exists the astonishing tendency to allow lax diets and to give patients almost unlimited freedom in choosing their diets as long as they restrict the high COH In some instances patients are permitted to run a "little sugar" Some patients who show a "little" sugar are given or advised to take a "little" insulin Other cases are permitted to eat freely of all foods and receive insulin injections perhaps once or twice a week. Still others are placed on unlimited diets and given a course of treatments (insulin injections), eight or ten in number and then discharged with their diabetes checked It is regrettable that we must admit that amongst

INADEQUATE FEBRUARY

Editors of journals are often subject to limitations which are unsuspected by their readers Routine operations of a printing shop, such as typesetting, go on through all the twenty-four hours of a day A holiday therefore means the loss of two working days, which is a serious matter to the editor in sending proofs to advertisers on scheduled time, for they, too, observe the holidays

February is the shortest month and the only one with two holidays, and since they have come near week-ends, they also spoil Saturdays and Mondays The result has been that out of the twenty-eight days of February, fourteen have been unavailable in setting up the JOURNAL

The advertisers, the editors, and the readers all will welcome March with its maximum quota of working days and no holidays

Finally in considering the patient *per se*, there seems to be a difference of opinion as to how much to teach the patient or tell him about his condition After all, his physician is his advisor, his councilor and the protector of his health and when the patient applies to us for aid, fearful, and in some instances with nerves shot to pieces what shall we do, what shall be our attitude? I think the best results are obtained with the case that is handled in a sympathetic and understanding manner, where the physician makes an associate as it were of the patient in the treatment of his particular case (Joslin's idea) I believe the patient should know

1 How to test the urine for sugar
2 How to regard his condition and what it means
3 That blood-sugar determinations are essential
4 That sugar-free urines do not mean any let-up in the general management of his case.
5 That most of all adherence to diet and general rules laid down for him means success
6 In a general way what we are trying to do and why
7 That transgression from the path outlined for him means a severe penalty, whereas loyalty and cooperation mean all the benefits of a long-continued life

county His formal address is necessary in order to inform the members about a proposed survey But he will fail in his mission if he accepts the congratulations of the members who compliment him on his fine plan and then simply take him out to supper The closing words of a successful address on "Making a County Medical Survey" will be "Now we would like this County to undertake such a survey at once and we suggest that before you go home, you choose the leaders who will lay out the survey and conduct it" This is exactly what the chairman of the Committee of Public Relations has done, with excellent results

Now what about the rank and file of the members of a county society? Are their duties completed when they have named a working Committee? Far from it, for they are charged with the duty of following the leaders whom they have chosen and of giving some of their time and effort in carrying out the plans of the Officers and Committeemen

The usual course of events in every item of Medical Society progress is that a new idea is born in the brain of an idealist whose conscience is of peculiar sensitiveness He inoculates a few colleagues whose consciences, while sensitive, are yet controlled by practical considerations, and the members of that small group present their plans to their colleagues who agree to approve and suport the leaders in the work which they shall do in the name of the Society A few leaders must necessarily do the work of the scoiety The dynamic force and inherent appeal of their cause will be transformed into the support and co-operative action of the great mass of members The basis of success in any activity of a County Medical Society consists in the personal work of discovering and inspiring a leader for that activity

---

LOOKING BACKWARD

THIS JOURNAL TWENTY-FIVE YEARS AGO

Dust and Pneumonia— This JOURNAL for March, 1904, contains an editorial comment of the Advisory Board to the New York City Commissioner of Health on pneumonia, which sets forth the prevailing opinion that pneumonia was caused principally by dust—a theory which later was supplanted by the present one of droplet infection The article says

"The various forms of acute pneumonia which are now prevalent both in adults and in children are incited by bacteria Exposure to cold, overexertion, lack of physical vigor, abuse of alcohol, etc predispose the individual to pneumonia, but are not its direct cause The bacteria (germs) are usually conveyed in the dust of air contaminated by sputum, nasal or other discharge, not always of those who are ill, which, upon drying, is widely disseminated

"It is, therefore, of urgent importance that the regulations of the Health Department for the suppression of the filthy and dangerous practice of spitting upon floors, pavements or other unsuitable places should be rigorously enforced

"It is further most important that in the cleansing of private houses and all public conveyances and places of assembly, the methods adopted should be such as will remove, and not simply stir up, the dust For dust contaminated may incite in susceptible persons some form of acute pneumonia as well as tuberculosis, and the more common colds and catarrhs

"Feather dusters should be abandoned and moist cloths used for dusting Whenever practicable, sweeping should be done in the evening, so that floating dust may completely settle before its removal by moist cloths in the morning It should be remembered that dust settles on floors as well as on furniture, so that moist mops should be passed over floors, when these are uncarpeted, as part of the morning dusting

"The Advisory Board of the Health Department cordially commends the purpose of the Department to secure proper methods of cleaning and dust disposal in the public schools In the modern conception of effective sanitation, intelligent cleanliness is one of the most useful measures for the suppression of communicable diseases The Advisory Board would urge upon the Health Department the desirability of instructing in the proper methods of dust disposal all of those who have in charge the duty of cleaning public institutions, such as court rooms, police stations, hospitals, dispensaries, churches, theatres, public conveyances, etc, as well as those responsible for factories, stores, offices and the like, and commends the matter to the attention of all householders, to whom not less than to inmates of public institutions and places of assembly the risks of dust infection are at this time of special significance."

LEADERSHIP IN COUNTY SOCIETIES

The leaders of all organizations set up a wail and ask the questions "Why don't our members turn out to meetings?" "Why don't they take part in the activities in the organization?" "Why do they sit on the side lines and criticize the workers?" Medical societies are confronted with these same questions, and many excellent leaders become discouraged because of the apparent indifference and even critical attitude of the members If medical men were indifferent or critical above the members of other professions, there would be ground for pessimism But as a matter of fact, physicians have united themselves together into active organizations to an extent far greater than other professional men The very fact that those whom they treat are evidently in distress and pain appeals to the fundamental sympathies which exist in all men, and doctors obey the traditional dictates of their profession and sacrifice their personal interests to relieve the suffering

Physicians are always ready to respond to calls from those actually suffering They willingly respond to a demand for their service, but they will not seek to force their ministrations on those who do not seek their services Yet every physician is acutely aware of early cases which could be cured, and of other cases which are exposed to conditions leading to sickness and incapacity The response of any individual doctor to these impersonal conditions will depend largely upon his temperament. Few doctors have altruism or the missionary spirit developed so highly that it compels them to make provision for meeting dangers which are still afar off Every doctor will act in response to an appeal to a love of his fellow men which exists in the breasts of all normal persons and requires only a leader to bring it into action

Physicians universally recognize their civic duty to the public, to bring the benefits of medical science within the reach of all persons Some realize this compulsion in only an academic way, and say "Someone ought to do something about the water supply," and then they straightway dismiss the subject from their minds as something which does not bother them at all There are other physicians whom the knowledge of such conditions make acutely uncomfortable They have what is popularly called a conscience which is sensitive and responds quickly to appeals for service Those with such a conscience may try to suppress it, and to ignore the unhealthful condition, but their temperament is such that they cannot put aside their thoughts, and they are unhappy unless they are actively engaged in curing the condition Men and women with these acute consciences are the leaders in reforms and in welfare work Their anxiety to improve conditions often leads them into impractical schemes and draws out the dislikes and criticisms of those whose consciences are not of the "hair trigger" style Yet, it is these idealists who inspire medical progress along all lines

Physicians are intensely practical, and they know clearly what plans will work in their own community and what ones are visionary They are also progressive, and are willing to try any new plan which offers a prospect of success They know that the only medical plans which are likely to lead to success are those which are supported by the majority of the doctors of a community

It would never do to have every individual physician publicly expressing his opinion in regard to subjects on which he is not well informed The proper course for him to follow is to talk it over with his associates Hence, every doctor believes in the necessity of a medical society Even those who do not join their county medical society have faith in its resolutions and plans

Every county society is led by a very few doctors whose consciences are sensitized to the sufferings and defects of their fellow men, and who feel an inward compulsion to improve conditions The problem of putting life into a county medical society consists first in discovering the leaders, and second in keeping them as officers or chairmen of committees Holding an office in a county society should be only a preliminary training for an ever-widening field of service

It may be best that the leader should not have a conscience that is too acutely sensitive. The successful leader of a county society is one who goes ahead no faster than his colleagues can follow If he goes forward too fast, he finds himself alone in the enemy's territory, a helpless prisoner

Discovering the leaders is the result of personal work. Leaders seldom volunteer, especially for service which is quiet and unspectacular Moreover, most efficient men are modest and hesitate to make promises whose results are problematical These leaders must be sought out, and assigned to special duties which they are willing to undertake and which can be done with comparative ease

It is within the scope of the activities of the officers and committeemen of the Medical Society of the State of New York to assist in finding men who will become leaders in County Society work It is not enough that a State Officer should make a formal address before a County society on the need, for example, of making a medical survey of the

tails are lacking, but apparently there is no connection with the new radiodiathermic apparatus now in the experimental stage, although the claims made are very similar in both cases The main feature is the ability to deliver short waves, only a third the usual length The substitution of condensor electrodes which do not come in contact with the skin also suggests radiodiathermy The amperage is very low and the current source is an ordinary alternating circuit of 220 volts It is evident that between the present apparatus and the possibility of radiodiathermy the outlook for progress in this direction is very promising —*Deutsche medizinische Wochenschrift,* December 14, 1928

Local Tonsillectomy by the La Force Method—Samuel Cohen believes that the La Force tonsil operation is more rapid than any other method, that the post-operative appearance is better, and that the patients do not consider it as bad as other operations that they have seen or heard of He emphasizes certain points in the technique which add greatly to the success of the procedure First, it is important, in using the La Force instrument, not to rely on touch only, sight must always control the sense of touch One tonsil must be injected with the local anesthetic and removed before the other is injected Rigid asepsis is most important. Patients are instructed to bring a toothbrush and tooth paste, so they can brush their teeth thoroughly before the operation Then the patient is given a mouth wash of potassium permanganate solution A one-grain tablet of novocaine is dissovled in 4 drams of distilled water and boiled No adrenalin is added, as Cohen finds that in most of the fatalities reported from the use of novocaine adrenalin seems to have been added The claim that a few minims of adrenalin incorporated in the novocaine solution lessens hemorrhage is, in his experience, a fallacy The anterior pillar and the crease between it and the tonsil are swabbed with 3 per cent iodine, and a syringe full of novocaine solution is injected between the anterior pillar and the tonsil, hugging the tonsil, and taking care not to get the solution outside the pharyngeal aponeurosis and superior constrictor muscle, because if the solution gets into this area and infection occurs it will be in the pterygomaxillary fossa, and thus a dangerous complication will arise The patient must keep his mouth open until the operation is finished to avoid contaminating the site of injection He is placed on the operating table with the head somewhat lowered The tonsil is then engaged in the La Force instrument by the following steps (1) The instrument is used as a tongue depressor, (2) the end is inserted behind the tonsil and the tonsil is lifted up, (3) the tonsil is pushed through the fenestra with the thumb of the left hand, (4) the instrument is slightly pulled toward the operator and closed down so that the dull blade is seen to go between the tonsil and the anterior pillar, the screw is tightened down and the instrument lifted up The tonsil is grasped by a tenaculum and cut off by the sharp blade of the La Force The patient immediately sits up until all bleeding stops, and is then told to lie down again —*Laryngoscope,* December, 1928, xxxviii, 12

Acute Perforation of Peptic Ulcer—James M Troutt quotes statistics which show that peptic ulcer occurs one-half times more frequently among white soldiers serving in the United States Army than among those in Hawaii, but perforates four times more frequently in the latter The average incidence of peptic ulcer in the United States Army as a whole, for the five-year period of 1922 to 1926, is 0 73 per thousand, which is about one-twelfth of Morton's percentage for clinical cases The admission rate for peptic ulcer in Hawaii is decidedly below the rate for the entire army, while the percentage of ulcers perforating during the years 1922—1926 in enlisted men in Hawaii was 33 3 per cent. as compared with 7 77 per cent for the same class of soldiers serving in the United States, and with 12 per cent. for the general population The percentage of acute perforations has steadily increased almost sevenfold since 1922 The most significant fact with regard to perforated ulcers among soldiers in Hawaii has been the large percentage of acute ulcers In a search for the cause of the high incidence of acute perforating ulcers among soldiers in Hawaii, Troutt finds that these men suffer from nostalgia, mental depression, and lowered nerve tone, which leads to excessive smoking and, most important of all, to the excessive use of impure alcoholic beverages Alcohol has been generally admitted to have an important effect in causing perforation, since many perforations have been preceded by an alcoholic spree —*Surgery, Gynecology, and Obstetrics,* December, 1928, xlvii, 6

The Modern Treatment of Rickets—Professor H Aron of Breslau gives an elaborate monographic summary of the recent advances in this direction We may pass over the use of cod-liver oil, rayed food substances, ergosterin, etc , and take up briefly the orthopedic management which is liable to be sidetracked Sitting and standing, walking, etc , must be supervised There is the tendency to bowlegs which may be over-corrected into knock-knee When the child begins to walk a physiological flat foot appears which may erroneously be treated

MEDICAL PROGRESS

Nature of the Cancerous Cachexia.—A Krecke refers first to the pallor and emaciation of many cancer subjects in the latter stages of their malady Although a late symptom it is often the first diagnostic evidence of the disease Absence of emaciation is no argument for the non-existence of the disease, for in many cases of visceral cancer the patient retains his weight Cachexia and emaciation may be considered jointly as having well known causal mechanisms One of these is hemorrhage—repeated losses of blood, which also make for the pallor Another is the ulceration and the resulting discharge—chronic suppuration with its loss of albumin which leads to emaciation, pallor, and at times fever A third mechanism is the putting of important organs out of commission—the stomach, esophagus, rectum, etc In certain cases we can understand how the patient escapes cachexia even in advanced stages, due to the absence of these three enumerated factors This we are apt to see especially in certain cases of cancer of the female breast, corpus uteri, and rectum, the latter naturally when a colostomy has been performed The survival in some of these cases is remarkable A fourth factor to be reckoned with in these cases is the metastases, but the mere presence of the latter is not sufficient to produce cachexia in the absence of a special mechanism such as putting some important organ out of commission or intense pain causing insomnia, etc In general, in suspected visceral cancer we should follow the old rule of noting the weight, color, etc, in regard to diagnosis, but at the same time bear in mind that a subject in blooming health may have a cancer of the body of the stomach or colon which will change the favorable outlook in a very short time through hemorrhages, obstructive symptoms, etc—*Munchener medizinische Wochenschrift,* November 30, 1928

Some Points in the Chemical and Biochemical Side of Cancer—As early as 1889 Albert Wilson used sheep and goat serum, injected subcutaneously, in several cases of cancer with remarkable results He had found that the goat was never attacked by cancer Webb, in 1901, formed the opinion that the first lesion in carcinoma was a separation of cholesterin from the living cell, effected by local injuries, by a local chemical change, or by a change in the liver secretion, probably a loss of bile salts and soap or fatty acid in the bile He claimed several apparent cures and improvements from soap injections, where the liver was at fault he administered bile salts in addition to the soap The writer used this treatment in one case with apparent success It was the belief of A Shaw Mackenzie that the agent in the serum which enables it to attack cancer is a pancreatic enzyme, which activated prolipase, which is present in all the body tissues and in the pancreas, and is protective He found that the soluble enzyme may be replaced by other substances, *e g*, bile salts and fatty acids, or their sodium salts or enzymes The serum of various animal extracts notably accelerates the enzyme or prolipase The serum itself does not split fats, but contains an activating agent In progressive or advanced cancer this power of the serum is decreased Upon this fact is based Mackenzie's method of serum diagnosis, namely, that when small quantities of normal serum are added to pancreatic extracts and incubated, the fat-splitting action on olive oil or emulsion is greatly *increased,* when carcinoma serum is added in the same way, the fat-splitting action is *decreased* This method of differentiation has proved correct in 221 of 230 serums tested On this basis the logical treatment of cancer would be the stimulation of lypolytic activity—*Journal of Tropical Medicine and Hygiene,* December 15, 1928, xxxi, 24

A New Type of Diathermy Apparatus—Franz Nagelschmidt describes in much detail a new form of apparatus and its uses, which is summed up by the author himself as follows The older apparatus is not to be scrapped for it still fulfils most of the demand The new is more convenient because the patient need no longer undress The great positive advantage is that a much larger section of the body can be warmed through—the skull, an entire lung, the pelvis Perhaps it will be possible to raise the temperature of the blood mass and the body as a whole In such a case the "aseptic fever" which the patient will present, will differ notably from infectious fever It spares the oxidation of reserve combustibles and involves no waste of the tissues The margin of safety must be borne in mind for while the body will readily tolerate 41 5° C (106 7° F) over a considerable period, a temperature of 43° C (109 4°F) which is quite practicable, may kill the patient It is also hazardous to warm the brain alone above a certain point In perfecting his apparatus the author mentions that some of his research was conducted in Chicago In the description of his new model the author gives no photographs or diagrams and some de-

should be worth while. Lack of vitamin-A in the diet leads to stone formation in the rat bladder Hence in subjecting their rats to this diet the authors studied controls in which with such a diet, milk or codliver oil was added in thought of prevention The total number of animals studied was 100 and the duration of the experiment 154 days One group of 37 rats received the customary rat food—bread, fruit, grains, swill, etc —and none in this group developed any stones The deficiency diet was made up of barley, polished rice, and yeast. Of 28 rats followed up over 5 months and then killed, 7, or 25 per cent, had calculi in the bladder, the number and size showing much variation The rats whose deficiency diet was compensated by milk or codliver oil did not develop stone In regard to the practical side of this subject McCarrison has called attention to the frequency of vesical calculi in the children of the primitive peoples in India and has recently stated that under the influence of a balanced diet this status improves notably In countries where such a campaign has not yet been carried out, this ailment is still notably common in nurslings and children No theory is given by the authors to explain the formation of these stones, but apparently they originate in the bladder and not higher up, consisting very largely of phosphates They are not necessarily the result of preceding cystitis, although in some individual rats there were marked evidences of infection The nutrition of the stone rats was notably poor, they were emaciated and anemic and some died too early for stones to have formed —*Munchener medizinische Wochenschrift,* December 21, 1928

Study of Goiter in Primitive Peoples —Dr C R Pfister a Swiss familiar with this dieease in his own country, has investigated an endemic of the same among the Bataks of Sumatra He investigated 48 villages with the technique employed in Switzerland, grading the cases by the degree of thyroid enlargement. In the communities studied there was a marked excess of female births and a higher mortality among girls and women than in males Females suffered more from goiter than males, although the excess was small The disease curve showed a sharp ascent at puberty, later the ascent being more moderate The author was unable to find a single external factor to the operation of which he could attribute the beginnings or development of the disease, and he therefore concluded that it was due to causes purely endogenous In other words the goiter subject is a biological variant, and his disease is a genotypic alteration If he is right, Pfister says, the only remedy is to breed the disease out This can readily be done in the case of goitrous animals, but the author has no definite plan which might hold good for mankind. New settlers in the tropics should be prevented from breeding with goitrous natives and marriage of a goitrous subject could be made the subject of restrictive measures Goitrous subjects could be prevented from settling in certain communities As a rule they are not much inclined to change their abode The Bataks live largely in isolated communities where in-breeding is inevitable and this factor must play a role in the goiter incidence Men are killed off in the war, others migrate, and the tendency is for the unfit to remain behind There is a general physical inferiority, often with a suspicion of cretinoid degeneration among these residual dwellers The author is evidently entirely skeptical as to any influence of soil, food, drinking water, etc, in the causation and as to the possibility of any improvement of conditions from hygiene — *Schweizerische medizinische Wochenschrift,* December 22, 1928

Benign Tumors of the Duodenum.—In a search of the literature Donald C Balfour and Earl F Henderson find that King, in 1917, collected 119 cases of benign tumor of the intestine, of which five were in the duodenum. To these they add eight cases culled from the literature and six cases seen at the Mayo Clinic The rarity of benign tumors of the duodenum and the fact that they do not necessarily produce symptoms are the chief reasons that they are so seldom encountered in surgical practice Of the six cases here reported, five were in men and three in women The patients ranged in age from 22 to 50 years Two of the tumors were myomas, 2 adenomas, 1 ademomatous polyp, and 1 a hemangioma The most significant sign was hemorrhage, which was severe in four of the six cases In five cases some form of indigestion was present, in three of these it had simulated somewhat the ulcer type A tumor was not noted on examination in any case. In only one case was definite obstruction present. This is in sharp contrast to benign tumors elsewhere in the small bowel, which usually first attract attention by producing intussusception The tumor was ulcerated in three of the six cases A diagnosis of benign tumor of the duodenum can be made only by the roentgen rays Unless the tumor is large it is difficult to visualize it on account of the rapid passage of the medium through the small bowel While gross gastric hemorrhage or melena should suggest the possibility of benign duodenal tumor, other intragastric and duodenal lesions are so much more common that this is a remote possibility So far as the authors have determined no instance of a benign duodenal tumor having undergone malignant degeneration has been reported —*Annals of Surgery,* January, 1929, lxxxix, 1

with arch supports, which deprive certain muscles of the privilege of exerting their normal corrective functions In most cases muscular exercise, walking on the toes, and other simple resources suffice Our art is not yet far enough advanced to correct anomalies of the spine and thorax and we also know by this time that retentive apparatus, like corsets, jackets, and braces, does more harm than good About all we can do here is to make the child sleep on a hard mattress or at least avoid feather beds which tend to weaken the back muscles In other words we must not think of the treatment of rickets merely as a matter of light rays and vitamin, but include proper skeletal development by special measures—*Klinische Wochenschrift,* December 16, 1928

Chronic Nephritis in Childhood.—J C Spence states that, although from the standpoint of morbid anatomy there are no forms of chronic nephritis that are peculiar to childhood, there are certain clinical features that deserve attention He discusses three types of chronic interstitial nephritis The first type, the "small white kidney," is characterized by an unrecognizable onset, marked uremic nephritis, and a slow course with renal dwarfism, sometimes very marked It does not appear to result from any preceding nephritis or infection, and though terminating in uremia, it does not produce any rise in blood pressure or retinitis In the second type there is a history of acute glomerular nephritis or prolonged sepsis Within a few years after the initial illness, high blood pressure (150 to 200 mm), cardiac hypertrophy, albuminuria with red blood cells, and retinitis occur The course of the disease is usually rapid This type is not common in children but fairly frequent in early adult life A third, and exceedingly rare, type of chronic interstitial nephritis is characterized by primary arteriosclerotic changes, with secondary contraction of the kidneys The cause of the arteriosclerosis is unknown, but it is probably an inflammatory and not a degenerative agent Renal dwarfism and tetany in chronic nephritis are probably dependent on a disturbance of the calcium-phosphorus ratio of the blood, possibly due to a parathyroid syndrome The best that can be done in the way of treatment is to maintain what health the patient possesses by conservative methods No success has been observed from the use of glandular extracts Chronic parenchymatous nephritis is the commonest type of nephritis in childhood In classical, uncomplicated cases there are no red blood cells in the urine and the blood urea is normal, but the disease rarely runs an uncomplicated course It is often due to a toxin, most frequently of the staphylococcus, the source of which should be sought and eliminated A high protein diet is beneficial, decapsulation is useless It is important that the patient be guarded against intercurrent infections The possibility that some cases of chronic interstitial nephritis have their origin in a chronic ascending pyelonephritis is worthy of consideration—*British Medical Journal,* December 22, 1928, II, 3546

Progress in Clinical Midwifery—Max Henkel enumerates briefly the present state of our knowledge of certain aspects of practical obstetrics In regard to new methods of obstetrical analgesia none has given such general satisfaction as to come into ordinary use. The subject of pregnancy toxicosis is bound up in that of the metabolism of the gravida and of the behavior of the internal secretions, and evidently we know too little under these heads, for the question is still unanswered as to why most women escape autoxicosis, while others suffer slightly, and still others perish The author is also a pessimist on the early diagnosis of pregnancy, but failure here is not worse than the failure to detect disease in its earliest stages A fourth subject in which we are backward is the effect of the rontgen rays on the ovaries and fetus itself, and whether any unfavorable action on the fetus really proceeds from the action on the ovary This subject naturally includes the sterilizing and abortifacient action of the rays and the possibility of a delayed action Personal equation clearly plays a dominant role here and we cannot reason from one patient to another A subsidiary problem is the possibility of arrested physical and mental development of the fetus Under the head of operative procedures for enlarging the pelvic diameters the author mentions the theorectically sound measure of ablation of the promontory, although in practice this does not seem to have made good He discusses cesarean operations at length and decides that transperitoneal cervical section is a great step forward Control of the numerous forms of uterine hemorrhage appears to show no definite advance A great problem for the future to decide is that of the induction of labor—when and how—and of control of the pains In regard to protection of the perineum a short expulsive period is a desideratum and the author believes that a deep median vaginoperineal incision, running as far back as the sphincter, will greatly shorten the expulsive stage and can be readily closed with sutures—*Deutsche medizinische Wochenschrift,* December 21, 1928

Calculus Formation from Vitamin-A Deficiency—Drs S Perlmann and Weber report their study of this subject from the surgical clinic of Professor Bier Research was limited to rats but in view of our ignorance of the causes of stone in mankind any suggestions

astute medical observer would readily comprehend his condition Information thus acquired is clearly within the scope and meaning of the statute "[3]

Further judicial interpretations of the rule will be of interest to the profession As previously stated, in order to establish the privilege the relationship of physician and patient must exist Thus, in the Griffiths case, which was an action for negligence in which the defendant was sued for running over a boy, a doctor who was in the employ of the defendant (not the boy), but who visited the boy in the hospital in order to ascertain the extent of his injuries, but not for the purpose of treating him, was held competent to testify to conversations with the boy, on the ground that the relationship of physician and patient did not exist [4]

In the Sliney case, a criminal action, it was held that a physician who examined a prisoner at the request of the District Attorney for the purpose of giving evidence as to the prisoner s sanity, was competent to testify to any information gained as a result of that examination, as the relationship of physician and patient was not there [5]

In the Kelly case, a civil action, the plaintiff called upon the physician a few days before the trial to ascertain what testimony the physician would give He did not call upon the physician in order to obtain medical treatment. It was held that the physician should be permitted at the trial to testify as to what the plaintiff said to him on that visit, the test as to whether the professional relationship exists being whether or not the physician has gained his information in the course of giving professional advice or treatment [6]

We have frequently been asked as to whether or not the fact that no fee was paid was determinative of the existence of the privilege In the Bauch case, it was squarely held that the payment of a fee was not essential to the relationship of physician and patient, and that a free patient was entitled to just as full and complete protection under the statute as a patient who had paid a fee [7]

Nor does it make any difference whether or not the physician was called by the patient himself, by a member of his family, or indeed by another physician Even if he is called by an utter stranger, if he attends the patient for the purpose of giving professional advice and aid, the relationship of physician and patient exists and the privilege arises Indeed, the fact that the patient was unconscious when the physician arrived and was unaware of the physician's presence, makes no difference If the physician in such cases attends for the purpose of giving professional attention or advice, the relationship of physician and patient exists, and the privilege is intact [8]

Thus, in Meyer v Knights of Pythias, it developed that the physician was summoned by a bellboy in a hotel to attend a guest who had attempted suicide by attempting to eat "Rough on Rats" It was held that the physician in that case could not give any information which he obtained while treating the patient [9]

The question is often asked as to what kind of information is privileged The answer is that the privilege extends to any information which is necessary to enable the physician to prescribe for or treat his patient [10] Thus, in the Green case where an ambulance surgeon learned from bystanders as to how the accident had happened, he was permitted to testify concerning this information, since that information was not necessary for any purpose of surgical treatment [11]

An interesting application of this rule was made in the Nelson case, in which a physician while attending his patient at childbirth, learned that she had an umbilical hernia He did not treat her for this, and the knowledge of its existence was of no aid to him in caring for his patient Nevertheless, the physician was not permitted to testify concerning the umbilical hernia, inasmuch as the very nature of his employment compelled the disclosure to him by the patient.[12]

A different application of the rule was made in the Spares case, in which a physician was permitted to testify that he performed an operation on a certain person at a certain time and place, but it was held that he would not be permitted to describe the nature of the operation or any condition which was disclosed by his examination of the patient's body [13]

In recapitulating, the information which the physician is forbidden to disclose is that which he acquires while attending his patient *in a professional capacity* In order to render the privilege available, it must clearly appear that the physician was attending the party in a professional capacity, and that the information which he acquired was obtained in that attendance, and was necessary to enable him to act in his capacity as physician The burden of proof that such information was obtained in this way, rests upon the person asserting the privilege [14]

Thus, in the Burley case, a physician who attended a testator during the last year of his life was asked whether he observed the testator during this time *when he was not attending him as a physician* The court held that it was competent for him to answer such questions as went only to the observations made as to the outward physical facts that were seen

LEGAL

By Lloyd Paul Stryker, Esq.
Counsel, Medical Society of the State of New York

CONFIDENTIAL COMMUNICATIONS

This, the eleventh in our promised series of editorials,* deals with a subject of far-reaching interest and importance to the medical profession There is no subject upon which your Counsel has been more frequently requested to give advice We shall endeavor here to state clearly what the rule in New York State is, its history and its interpretation by the courts, to the end that all questions heretofore asked by individual members of the profession may be here fully answered

At common law, communications which were made by a patient to his physician for the purpose of receiving medical treatment were not privileged, no matter with what confidence they were made[1] This rule, says Professor Wigmore, "would probably have been acknowledged as a common law principle in every American court, but in New York in 1828 came a statutory innovation establishing the privilege, and the legislation of other States, accepting in this respect as in so many others the model established by the distinguished leaders of legal reform in that epoch-making movement in New York, embodied the privilege in other statutes Missouri followed next in 1835, until at the present day in one-half of our jurisdictions the privilege is a settled part of the law"[2]

In 1828 the New York legislature enacted a statute protecting privileged communications made by a patient to his physician This statute has been ever since in effect in this State, and is now found in Section 352 of the Civil Practice Act, which reads "A person duly authorized to practice physic or surgery, or a professional or registered nurse, shall not be allowed to disclose any information which he acquired in attending a patient in a professional capacity, and which was necessary to enable him to act in that capacity, unless where the patient is a child under the age of sixteen, the information so acquired indicates that the patient has been the victim or subject of a crime, in which case the physician or nurses may be required to testify fully in relation thereto upon any examination, trial or other proceeding in which the commission of such crime is a subject of inquiry"

Briefly analyzing this statutory rule, it will be observed (a) that the privilege extends to duly licensed physicians or to professional or registered nurses, (b) the facts thus privileged consist of "any information" which the physician or nurse acquired in attending a patient "in a professional capacity, and *which was necessary to enable him to act in that capacity*", (c) the rule is mandatory, it does not authorize the physician to elect whether or not he will disclose such a confidential communication, the statute says that he "shall not be allowed to disclose" the same

This statute was first commented on by our Court of Appeals in 1878, when in the Edington case Judge Miller wrote "The statute is very explicit in forbidding a physician from disclosing any information received by him which is necessary to enable him to prescribe for a patient under his charge It is a just and useful enactment, introduced to give protection to those who were in charge of physicians from the secrets disclosed to enable them properly to prescribe for diseases of the patient To open the door to the disclosures of secrets revealed on the sick bed, or when consulting a physician, would destroy confidence between the physician and the patient, and, it is easy to see, might tend very much to prevent the advantages and benefits which flow from this confidential relationship The point made that there was no evidence that the information asked for was essential to enable the physician to prescribe is not well taken, as it must be assumed from the relationship existing that the information would not have been imparted except for the purpose of aiding the physician in prescribing for the patient Aside, however, from this, the statute in question, being remedial, should receive a liberal interpretation, and not be restricted by any technical rule When it speaks of information, it means not only communications received from the lips of the patient, but such knowledge as may be acquired from the patient himself, from the statement of others who may surround him at the time, or from observation of his appearance and symptoms Even if the patient could not speak, or his mental powers were so affected that he could not accurately state the nature of his disease, the

* We are omitting numbers 9 and 10 of the articles outlined in this Department on page 96 of the January 15, 1928, issue of this Journal. Numbers 9 and 10 are on "The application of law to medicine," and "The legal duties and liabilities of the physician." These subjects are covered in other articles of the series

astute medical observer would readily comprehend his condition Information thus acquired is clearly within the scope and meaning of the statute "[3]

Further judicial interpretations of the rule will be of interest to the profession As previously stated, in order to establish the privilege the relationship of physician and patient must exist Thus, in the Griffiths case, which was an action for negligence in which the defendant was sued for running over a boy, a doctor who was in the employ of the defendant (not the boy), but who visited the boy in the hospital in order to ascertain the extent of his injuries, but not for the purpose of treating him, was held competent to testify to conversations with the boy, on the ground that the relationship of physician and patient did not exist.[4]

In the Sliney case, a criminal action, it was held that a physician who examined a prisoner at the request of the District Attorney for the purpose of giving evidence as to the prisoner s sanity, was competent to testify to any information gained as a result of that examination, as the relationship of physician and patient was not there [5]

In the Kelly case, a civil action, the plaintiff called upon the physician a few days before the trial to ascertain what testimony the physician would give He did not call upon the physician in order to obtain medical treatment It was held that the physician should be permitted at the trial to testify as to what the plaintiff said to him on that visit, the test as to whether the professional relationship exists being whether or not the physician has gained his information in the course of giving professional advice or treatment [6]

We have frequently been asked as to whether or not the fact that no fee was paid was determinative of the existence of the privilege In the Bauch case, it was squarely held that the payment of a fee was not essential to the relationship of physician and patient, and that a free patient was entitled to just as full and complete protection under the statute as a patient who had paid a fee [7]

Nor does it make any difference whether or not the physician was called by the patient himself, by a member of his family, or indeed by another physician Even if he is called by an utter stranger, if he attends the patient for the purpose of giving professional advice and aid, the relationship of physician and patient exists and the privilege arises Indeed, the fact that the patient was unconscious when the physician arrived and was unaware of the physician's presence, makes no difference If the physician in such cases attends for the purpose of giving professional attention or advice, the relationship of physician and patient exists, and the privilege is intact [8]

Thus, in Meyer v Knights of Pythias, it developed that the physician was summoned by a bellboy in a hotel to attend a guest who had attempted suicide by attempting to eat "Rough on Rats" It was held that the physician in that case could not give any information which he obtained while treating the patient [9]

The question is often asked as to what kind of information is privileged The answer is that the privilege extends to any information which is necessary to enable the physician to prescribe for or treat his patient [10] Thus, in the Green case where an ambulance surgeon learned from bystanders as to how the accident had happened, he was permitted to testify concerning this information, since that information was not necessary for any purpose of surgical treatment [11]

An interesting application of this rule was made in the Nelson case, in which a physician while attending his patient at childbirth, learned that she had an umbilical hernia He did not treat her for this, and the knowledge of its existence was of no aid to him in caring for his patient Nevertheless, the physician was not permitted to testify concerning the umbilical hernia, inasmuch as the very nature of his employment compelled the disclosure to him by the patient.[12]

A different application of the rule was made in the Spares case, in which a physician was permitted to testify that he performed an operation on a certain person at a certain time and place, but it was held that he would not be permitted to describe the nature of the operation or any condition which was disclosed by his examination of the patient's body [13]

In recapitulating, the information which the physician is forbidden to disclose is that which he acquires while attending his patient *in a professional capacity* In order to render the privilege available, it must clearly appear that the physician was attending the party in a professional capacity, and that the information which he acquired was obtained in that attendance, and was necessary to enable him to act in his capacity as physician The burden of proof that such information was obtained in this way, rests upon the person asserting the privilege [14]

Thus, in the Burley case, a physician who attended a testator during the last year of his life was asked whether he observed the testator during this time *when he was not attending him as a physician* The court held that it was competent for him to answer such questions as went only to the observations made as to the outward physical facts that were seen

by him when he was not attending as such physician.[15]

Among many others, the following communications have been held to fall within the rule of privilege Information obtained by a physician with respect to the health of an assured while he was attending such assured as a physician,[16] the fact that a patient had a venereal disease while under a physician's care,[17] in an action for divorce, a physician was forbidden to testify as to conversations had with him by one of the parties tending to establish adultery [18] The rule, however, does not forbid a physician from testifying to the fact that a certain person was his patient, that he attended such person as a physician, and the dates and number of times hourly or daily that he so attended such patient [19]

The question often arises as to whether or not the information which the physician gained was in fact necessary to enable him to treat the patient As to this, it has been held that the physician himself is a competent witness to show whether his knowledge of a fact regarding his patient was or was not necessary to the due performance of his professional duties [20]

A question which has frequently been asked is as to who may claim the privilege The answer is that whenever it appears that the privilege is asserted to protect the feelings or the reputation of a living patient or the memory of a deceased patient, the testimony of the physician will not be received no matter whether the objection is taken by the patient, his personal representative or a third person Even the assignee of a cause of action may claim the privilege [21]

In one case, the Appellate Division of our Supreme Court has held that where no objection is taken to the testimony of a physician, the court itself is in duty bound on its own initiative to refuse to receive the testimony [22] In that case, however, it appeared that the patient was not present in court to object or cause his counsel to object to the testimony The opinion suggests that if the patient had been present in court and heard the testimony without objection, that this would have constituted a waiver by him of the privilege in his behalf [23]

There is an immense amount of learning on the subject of the waiver of the privilege This branch of the subject may be divided into three divisions (a) actions brought by plaintiffs to recover damages for personal injuries to themselves, (b) all other civil actions, and (c) criminal prosecutions

(a) "Where," said the Court of Appeals in Hethier v Jones,[24] "the plaintiff in an action brought to recover damages for personal injuries caused by the negligence of the defendant describes these injuries and their results and it appears that he has consulted or been treated by a physician in regard to them he waives the protection of section 834 of the Code (now section 352, Civil Practice Act) The physician may then be called by the defendant and examined as to any information acquired by him in the course of such consultation or treatment The rule as it was formerly understood was altered by our decision in Capron v Douglass (193 N Y 11) We there took the position that where the patient tenders to the jury the issue as to his physical condition it must in fairness and justice be held that he has himself waived the obligation of secrecy which would otherwise exist"

In the Capron case previously referred to, the plaintiff brought an action against a physician for malpractice in the treatment of a fracture of the tibia and fibula One of the physicians who subsequently treated the plaintiff's leg was offered as a witness for the defendant, but was not permitted to testify on the ground that it would constitute the divulgence of a confidential communication This objection was sustained by the trial court, but was overruled by the Court of Appeals where Judge Haight, referring to the plaintiff's conduct, wrote "He has thus permitted the condition of his broken limb to be given to the public in an open trial, thereby forever preventing it and its condition from being a secret between himself and his physician The intent of the legislature in enacting the statute making such information privileged was, doubtless, to inspire confidence between the patient and his physician, so that the former could fully disclose to the latter all the particulars of his ailment without fear that he may be exposed to civil or criminal prosecution, or shame and disgrace, by the disclosure thus made, and thus enable the latter to prescribe for and advise the former most advantageously This action, as we have seen, was for malpractice The plaintiff both in his complaint and in his testimony has fully disclosed all of the details of his affliction as it existed both at his home and at the hospital He has given in much detail how the fractures occurred, how they were treated, his pain and suffering, and so far as he was able to comprehend, when not under the influence of anaesthetics, the particulars of the operation at the hospital He, himself, has, therefore, given to the public the full details of his case, thereby disclosing the secrets which the statute was designed to protect, thus removing it from the operation of the statute The character of the action necessarily calls for a disclosure of his condition and the treatment that was adopted by the defendant and those assisting him To hold that the plaintiff may waive the privilege as to himself and his own physicians and then invoke it as to the defendant and his physicians, would have the effect of converting the statute into both a sword and a shield It would permit him to prosecute with the sword and then shield him-

self from the defense by the exclusion of the defendant's testimony It would enable the plaintiff to testify to whatever he pleased with reference to his condition and the treatment adopted by the defendant without fear of contradiction The plaintiff could thus establish his cause of action, and the defendant would be deprived of the power to interpose his defense by reason of the closing of the mouth of his witnesses by the provisions of the Code referred to Such a construction of its provisions we think was never contemplated by the legislature. It would lead to unreasonable and unjust results "[25]

In this connection, we should give attention to the provisions of Section 354 of the Civil Practice Act which provides that the privilege cannot be waived unless it is "expressly waived on such trial or examination by the patient ," or in the case of the validity of the last will and testament of a deceased patient the privilege may be waived by the "executor or executors named in said will, or the surviving husband, widow or any heir-at-law or any of the next of kin, of such deceased, or any other party in interest" The statute further provides "The waivers herein provided for must be made in open court on the trial of the action or proceeding, and a paper executed by a party prior to the trial providing for such waiver shall be insufficient as such a waiver But the attorneys for the respective parties, prior to the trial, may stipulate for such waiver, and the same shall be sufficient therefor"

This Section was construed in the Capron case, and it was there held that inasmuch as the plaintiff both in his complaint and his testimony had fully disclosed the details of his affliction, that he had "therefore given to the public the full details of his case, thereby disclosing the secrets which the statute was designed to protect, thus removing it from the operation of the statute "[26]

In the McKinney case, the Court of Appeals said "After its publication no further injury can be inflicted upon the rights and interests, which the statute was intended to protect, and there is no further reason for its enforcement. The nature of the information is of such a character that when it is once divulged in legal proceedings, it cannot be again hidden or concealed. It is then open to the consideration of the entire public, and the privilege of forbidding its repetition is not conferred by the statute The consent having been once given and acted upon cannot be recalled, and the patient can never be restored to the condition which the statute, from motives of public policy, has sought to protect "[27]

The writer has sometimes been asked whether or not, where Patient A has sued Doctor B and has been subsequently treated by Doctor C, it is permissible for Doctor C (prior to the trial) to divulge the information gained by him in the treatment of the same injury, without the permission of Patient A. There is no question whatever but that Doctor C, if called as a witness for Doctor B, may at the trial testify to any facts learned by him in the course of his treatment, nor in our opinion is there any doubt but that Doctor C may divulge such information either to Doctor B or to Doctor B's lawyer in advance of the trial to enable Doctor B to prepare for trial Where Patient A in his complaint has disclosed (and he must necessarily do so in whole or in part) the facts of his condition, from the date of the making and serving of that complaint the privilege is waived For instance, in the Capron case, supra, the Court said "The plaintiff both *in his complaint* and in his testimony has fully disclosed all of the details of his affliction as it existed both at his home and at the hospital,"[28] and as will be recalled, the privilege was there deemed waived

In Terner v. Dare, Patient A sued Physician B for malpractice, and testified as to his own condition At the trial, the court excluded evidence as to the nature of the disease for which the defendant had previously treated the plaintiff, but the Appellate Division held that this exclusion was error, and Judge Kellogg said "It is evident that the defendant could not by experts show to what extent the present condition of the plaintiff might be due to a chronic disease unless he was able to show what the disease was *By bringing an action* against his regular physician, who had been treating him for a disease, claiming that the subsequent treatment was malpractice, the plaintiff waived the professional privilege and the defendant was permitted to show any facts he knew bearing upon the present condition of the plaintiff "[29]

To recapitulate, where Patient A has brought an action against his Physician B, by the mere making of his complaint and the bringing of his action he has waived that privilege which by law he would have been entitled to had he not instituted the action in question, and that privilege is waived from the moment of the making and serving of the complaint.

(b) In all other actions, that is, actions other than those for malpractice, personal injuries or the like, the privilege is not waived unless it is expressly waived in open court by the party claiming such privilege, or by the stipulation of his attorney prior to the trial.

(c) In criminal prosecutions, it has been repeatedly held that the patient's privilege cannot be used to shield a murderer or other criminal, where it appears that the privilege is in no wise asserted for the benefit of the patient Thus, in the Pierson case, where a defendant was charged with committing murder by arsenical poisoning, the testimony of the physician who had been called to attend the victim of the crime was offered by the prosecution to prove the cause of death The Court of Appeals held that the objection to

this testimony was properly overruled, upon the ground that the purpose of the statute was "to enable a patient to make known his condition to his physician without the danger of any disclosure by him which would annoy the feelings, damage the character, or impair the standing of the patient while living, or disgrace his memory when dead," and furthermore that the statute was not enacted for the purpose of constructing a shield for the benefit of murderers [30] Generally stated, the law is that where the death of a patient is the subject of a criminal prosecution, the testimony of the physician who treated the deceased will not be excluded on the ground of privilege [31]

Professor Wigmore, in his invaluable work on the law of evidence, has strongly criticized the New York statute creating this privilege which was unknown to the common law His discussion is interesting and valuable from a philosophic point of view, and indeed would be of great importance to the legislature of any State which had not previously enacted this privilege into law There are about 50 per cent of the States of the Union which have not adopted this legal privilege [32]

Whether Professor Wigmore is or is not correct from an abstract point of view is not germane to this discussion, although the writer, with due diffidence and modesty, would like to express his dissent from the views of this most distinguished law writer upon this subject The question, however, whether there should or should not be a privilege, is purely an academic one inasmuch as the privilege (subject to the qualifications hereinbefore outlined) has been in existence in this State by force of statute for one hundred years

TONSILLECTOMY—CLAIMED BROKEN TOOTH DURING OPERATION

In this case, the plaintiff, a man thirty-one years of age, came to the office of the defendant, a specialist in diseases of the nose and throat He gave a history of having been troubled with irritation of the throat for a number of years Upon examination the doctor found both tonsils and adenoids badly infected, and recommended an operation for their removal The patient consented, and a few days later the doctor, under general anesthesia, removed both tonsils and adenoids There was very little bleeding, and the patient made an uneventful recovery, and left the hospital the day after the operation

About a week later he came to the doctor's office, and complained that one of his teeth had been broken off during the operation, and demanded that the doctor pay him some money This the doctor refused to do, telling the patient that he did not break off any tooth during the examination or operation

Subsequently, the patient brought suit, charging the doctor with negligence in the performance of the operation, and claiming that during it the doctor had carelessly and negligently broken off a tooth The case came on to be tried, and at the close of the plaintiff's case, the plaintiff having failed to produce any evidence of negligence on the part of the doctor, his complaint was dismissed, thus terminating the matter in the physician's favor

NEWS NOTES

LEGISLATIVE BULLETIN NO 5—FEBRUARY 13, 1929

Since our last bulletin the following bills have been introduced in which we have an interest

Mental Hygiene

Assembly Int No 783—Goodrich, provides for a third assistant commissioner of correction who shall be a qualified psychiatrist of not less than five years' experience in practicing nervous diseases

Assembly Int No 784—Goodrich, provides for a psychiatric clinic at Sing Sing prison

Senate Int No 549—Wales, Assembly Int. No 787—Jenks, reintroduces bill relative to annulment of marriage on ground of incurable insanity

Assembly Int. No 857—Ambro, provides for examination of certain persons accused of crime, by a division in Mental Hygiene Department, to determine mental condition which may affect their criminal responsibility

Senate Int No 646—H D Williams, admission to institutions for mental defectives to be only on certificate of physician or psychologist or on voluntary application

Workmen's Compensation

Assembly Int No 772—Lefkowitz, amends Workmen's Compensation Law, making compensable every disease established by medical testimony to be due to nature of claimant's employment and contracted therein prior to date of disablement This is an improvement over the several other bills that have been introduced adding to the list of compensable diseases and occupations, and is more acceptable because it provides for scientific establishment of the fact that there is a disability There is a great desire on the part of everybody to have all compensable disability and the occupation causing it, recognized by law, but there is an objection to a blanket law on the ground that it would permit malingering

Child Welfare

Three new bills on child welfare have been introduced, authorizing (1) child welfare allowances where father is totally disabled, (2) for widowed mother with one or more mentally defective or physically disabled children under twenty-one, (3) grant of child welfare benefits notwithstanding fact that mother or children may be entitled to workmen's compensation award, in which case child welfare allowance shall be lien on workmen's compensation award

Public Health

Senate Int No 554—Quinn, Assembly Int No 775—Nugent, New York Charter—empowers commissioner of water supply, gas and electricity to require any company selling water in city to determine whether it is healthful, safe and proper for consumption and whether furnished in quantity and at pressure adequate for fire protection, cross connections between such system and the city's water system to be made if commissioner finds it necessary

Senate Int No 565—Pitcher, Assembly Int No 810—Lattin, provides local health board of a district within boundaries of a state park shall consist of park commission and state commissioner ex officio, such board to appoint health officer

Miscellaneous

Assembly Int No 927—Steingut, asks for exemption of property of medical colleges in certain cities

Hearings

There appeared before the Committee on Codes on Tuesday, proponents of the anti-vivisection bill They were fewer than usual and inclined to be less sentimental in their plea for the bill, as a matter of fact, they made a very weak plea this year On the other hand, Dr Sondern had brought along with him, in opposition to the bill, a very strong team, consisting of Drs Flexner, Sweet and Williams Dr Wadsworth appeared as the representative of the Department of Health There is no question about the impression left upon the committee and as to the fate of the bill

The following hearings are scheduled for the the coming week

Feb 19—Assembly Int No 35—Remer, birth control—Assembly Committee on Codes

Feb 19—Senate Int No 289—Brown, sterilization bill—Assembly Int No 338—Dominick, (Joint) Committee on Public Health

Feb 19—Senate Int No 438—Freiberg, water pollution—Senate Committee on Finance

Committee on Legislation, Medical Society of the State of New York

CADUCEUS POST, AMERICAN LEGION

Caduceus Post, Number 818, of the American Legion, which is New York City's Medical Post, held a meeting on January 12th in the New York Athletic Club building The principal feature of the meeting was a series of moving pictures of Russia taken by Dr Orrin S Wightman, Editor-in-Chief of the NEW YORK STATE JOURNAL OF MEDICINE Dr Wightman was a Major in the American Red Cross during the World War and went on a special mission through Siberia to Moscow and Petrograd, and down to the Crimea and Rumania, and took moving pictures showing bits of scenes, the customs of the people, and the women's regiment An attack of influenza held Dr Wightman home on the night of the lecture, but Dr Theron W Kilmer, who had lived in Russia, explained the pictures and added side lights of his own The room was crowded and those present gained a new idea of Russia as though with first-hand knowledge

Caduceus Post held its annual dinner on the evening of Saturday, February 16, in the New York Athletic Club, with about 250 members and guests present Col Douglas McKay, U S A, Commander of the State of New York, installed the officers as follows

Commander, Dr Samuel J Kopetzky, Vice-Commanders, Drs Fenwick Beekman, C Burns Craig and Kirby Dwight, Adjutant and Treasurer, Mr Robert R Gerstner, Chaplain, Rt Rev Herbert Shipman, D D

The installation ceremony was peculiarly impressive because Col McKay performed the prescribed ceremony from memory

Dr Harlow Brooks, as toastmaster, referred to his experiences in the army as the most satisfactory of all in his life, for they resulted in the lasting friendships of men who were accomplishing things worth while He introduced Col Charles R Reynolds, Commander Medical Field Service School, Carlisle Barracks, Pennsylvania, as the first officer under whom he had served in the World War and under whom also many of those present had served in Camp Upton, over seas, and at Carlisle Barracks

Col Reynolds described the standardization of the instruction in Carlisle, and especially the preparation of correspondence courses which are of a practical nature He also described a series of movies which are now being prepared in order to show service in the field to those who are unable to attend the Carlisle courses

Capt Rand P Crandall, U S N, spoke from the standpoint of the Navy and related humorous war stories

Major General Hanson E Ely, Commander of the Second Corps area, said that he had a very great respect for the medical officers, for, if they wished, they could find an appalling number of defects in an officer coming up for promotion or retirement He said that the training of the Reserves was designed largely to discover the capabilities of the men in order that they may be fitted to the needs of the service when an emergency arises

Brigadier General H O Drum, Commanding the First Division, U S A, spoke of the friendly bond which the war developed between the officers of the Regular Army and those of the Medical Corps Doctors were the first group of professional men that realized they had to prepare themselves for service, and to respond to the call for action German officers of note have paid a high tribute to the American physicians for their skill in performing their war duties

General Drum spoke of two factors to be considered in the prevention of war First, is the moral factor, which works both ways In 1793 a bill was introduced in Congress to establish a Department of Peace instead of War, and yet twenty years afterwards, the Government had to call out half a million of men to repel an invasion by seventeen thousand English soldiers who knew their business A second factor is commerce, now involving twenty-six billions of dollars, owed to the United States as the result of the World War The United States cannot secure peace nor collect debts, merely by wishing to do so

Col Albert E Truby, M C, U S A, spoke of the growth of the Reserve Corps, and said that there were 2,700 Medical Reserve officers in the Second Corps area alone He emphasized the need of young men as medical officers

Dr George Henry Fox spoke as one whose service was in the Civil War

Dr J Herbert Lawson, Past Commander, described the work among disabled veterans and said that the members of Caduceus Post were rendering invaluable services to the veterans free of charge Dr Lawson had recently been made Commander of the American Legion of New York County whose principal work is along medical lines in the diagnosis treatment of incapacitated veterans

Dr Kopetzky, the new Commander, spoke of the good fellowship which exists among the members of Caduceus Post, and of the plans for the regular meetings of the Post

QUEENS COUNTY—ANNUAL MEETING

The annual meeting of the Medical Society of the County of Queens was held at Eagle Palace on November 27, 1928, at 8 30 P M, president, F G Riley, M D, in the chair

The Board of Censors, through the Chairman, Dr E A Flemming, recommended and the following doctors were elected to active membership Louis Berwick, M D, 3149 36th Street, Astoria, Joseph E Breen, M D, Sanford Avenue and Bowne Street, Flushing, James R. DeRose, M D, 2333 Grand Avenue, Astoria, Samuel S Feuerstein, M D, 4215 Graham Avenue, Astoria, William Filler, M D, 3506 72nd Street, Jackson Heights; Arnold Gottesman, M D, 10020 37th Avenue, Corona, Clement A. Jarka, M D, 6124 Grand Avenue, Maspeth; David Kirschenbaum, M D, 6109 37th Avenue, Woodside, Louis Wachtel, M D, 4415 43rd Avenue, Long Island City, Martin L Weitz, M D, 8774 150th Street, Jamaica

Frederick H Fechtig, M D, Jamaica Hospital, Jamaica, was elected to associate membership (intern)

Ernest W Goode, M D, 294 Amherst Avenue, Jamaica, was received by transfer from the Medical Society of the County of New York

The Secretary reported the regular meeting of the Comitia Minora on November 10th and the conduct of the routine business of the Society

The nominations for the officers and boards presented at the October meeting and published in the Bulletin were duly elected

The annual financial report was presented by the Treasurer, Dr J M Dobbins, showing the following accounts on hand general fund, $3,071 73, sinking fund (initiation fees), $565, land fund, $1,200 36, total, $4,836 09

Scientific Session

Paper—"Achylia Gastrica," by Mills Sturtevant, M D Discussion opened by J M. Wicks, M D., and continued by Drs E E Keet, T C Chalmers and closed by Dr Sturtevant

Paper—"The Dose of Medicine," by E E Smith, M D Discussion opened by Dr E E Keet and continued by Drs Chalmers and Riley

Adjourned Collation Attendance, 83

E E Smith, *Secretary*

QUEENS COUNTY—JANUARY MEETING

A stated meeting of the Medical Society of the County of Queens was held at Eagle Palace on Tuesday, January 29, 1929, at 8 30 P M The meeting was called to order by the retiring president, Dr F G Riley, who introduced president-elect, W J Lavelle, M D, as he took the gavel

The following new members were elected Adrian Eugene Donnelly, M D, 4169 Parsons Boulevard, Flushing, David Klein, M D, Jamaica Hospital, Jamaica, Anna Mirkin Schlesinger, M D, 101 North 108th Street, Corona.

The following associate (intern) members were elected Frank J Corniglia, M D, Jamaica Hospital, Jamaica, Frank Vincent Yannelli, M D, Jamaica Hospital, Jamaica

Dr T C Chalmers, Chairman, reported for the Board of Trustees

In the absence of the Chairman, Dr H C Courten reporting for the Committee on Medical Economics, stated that the Committee had in mind another class on public speaking to be conducted without an instructor at about $5 00 per member. Members of the Society wishing to join such a class were asked to notify Dr Rohr, Chairman of the Committee.

Scientific Session

(1) Address—"The Private Physician as Public Health Agent," by Shirley W Wynne, M D, D P M, Commissioner of Health Discussion by Drs F G Riley, Charles S Prest, J J Kilcourse, Harry M White, D F Downing, Miss O'Neil, James M Dobbins and closed by Dr Wynne

(2) Address—"Urology, Its Place in Practice," by Francis G Riley, M D, Retiring President. Discussion opened by Dr Irving Simons and continued by Drs E E Smith and G A. Distler and closed by Dr Riley

Attendance, 72 Collation was served after the meeting

E E Smith, *Secretary*

MEDICAL WARES

PHONOGRAPHIC RECORDS OF HEART SOUNDS

A phonograph is to sound as a cinematograph is to sight While moving pictures have been adapted to teaching medicine, phonographic records have been used for that purpose to only a slight extent, but researches by the Western Electric Company and the Columbia Phonograph Company, Inc, have resulted in the development of practical means of making records of the chest sounds, especially of the heart

One difficulty in the reproduction of heart sounds has been that, while the normal heart sounds are faint, the abnormal ones are usually still more faint, and are likely to blend with the normal sounds Some magnifying device was therefore necessary in order to produce vibrations of sufficient intensity to drive the stylus which cuts the wax of the recording cylinder The invention of the sound magnification of the radio has resulted in the development of the device called the "multiple stethopone," which enables a roomful of students to listen to the heart and lungs The principle of the multiple stethophone is that the heart sounds produced by a patient are received in an ordinary stethoscope and are conducted to an amplifier from which branching tubes extend to the individual students of the room, each ending in a double ear piece like those of an ordinary stethoscope Such a device was exhibited at the annual meeting of the Medical Society of the State of New York in Syracuse, on May 14, 1925, as related on page 761 of this JOURNAL of June, 1925

The Stethophone was not entirely satisfactory, because the magnified sounds did not preserve their relative values when they entered the ear For example, when a sound of a high pitch was magnified, it became piercing to the ear, while a considerable magnification of a sound of a very low pitch was scarcely apparent to the ear Sounds of high pitch therefore became unduly prominent in the stethophone This difficulty was largely overcome by the development of filters which were adjusted to exclude or soften certain sounds The elimination of the high pitch sounds was comparatively easy, but when they were eliminated, there was likely to be an unbalance of the remaining sounds An observer's judgment of the sounds of the heart or lungs is the result of a composite blend of sounds of various pitches and intensities, and when one particular sound is magnified, or excluded it becomes unduly apparent Moreover, the blending of sounds of high pitch with those of low pitch was difficult, although the problem could probably have been solved if sufficient time and money had been expended on it

The stethophone was successful in transmitting the sounds of the heart, for they were largely of low pitch, but it was not developed to a point where it would transmit the high pitched breath sounds and rales of the lungs

Phonographic records of the heart beats have been made under the direction of Dr R C Cabot, Professor of Clinical Medicine of the Medical School of Harvard University, and Dr C J Gamble, of the Medical School of the University of Pennsylvania Their records are on on phonograph discs of regular size and are available on the market They are made by the use of the stethophone and are faithful records of the sounds which the stethophone produced The phonographic heart records are therefore subject to the same limitations as the sounds of the stethophone in a recitation room

The inequalities of harshness of the phonographic tones of the heart records may be softened by the use of a special sound recorder which has been developed by the Columbia Company, and they may be still further modified by the use of a fiber needle

The ear of a medical student is trained to pick out a particular biological sound from a number of others, and to do it when all the sounds are of an intensity to which his ear is accustomed For example, when he first listens to a heart he is confused by the multiplicity of sounds which come from the lungs and from outside sources, but gradually he learns to ignore the extraneous sounds and to concentrate his attention on a particular sound, which at first is almost inaudible When he hears a phonographic record for the first time, it is likely to be several times louder than the natural sounds to which his ear is accustomed, and so he may not recognize the fine points, but if a phonograph record of the heart is carefully adjusted to the loudness or intensity to which a doctor is accustomed, it will prove itself to be a faithful reproduction of the original sound

THE DAILY PRESS

TEAR GAS IN HOLD-UPS

The bandits of New York City are up-to-date in adopting tear gas in the place of pistols The accounts of the use of the gas do not seem to reach the newspapers, but yet according to the New York *Times* of February 6th, the Board of Aldermen passed the following resolution

"No person shall manufacture, sell, possess or use any lachrimating, asphyxiating, incapacitating or deleterious gas or gases, liquid or liquids, or chemical or chemicals, without a permit to be used issued by the Police Commissioner, under such regulations as he may prescribe."

The *Times* states the reasons for adopting the resolutions were as follows

"Passage of such an ordinance was suggested by the police after they had found the gas in possession of several criminals, in containers resembling fountain pens and easily carried in a vest pocket The police learned that the gas and these containers had been sold by two sisters, both of whom have police records

"Police Inspector John J Noonan and Colonel Charles W Exton, chemical warfare officer, stationed on Governors Island, appeared before an Aldermanic committee recently and stressed the need of such a restrictive measure. The Police Inspector exhibited one of the fountain pen devices and offered to demonstrate its use Fearful of the effects of the gas, the committeemen agreed to take his word for it.

"He and Colonel Exton told them that in some of the Western cities criminals were discharging the gas from hollow walking sticks They declared that it could readily be used in hold-ups and that enough volatile gas could be discharged from one of these harmless looking containers to render several victims helpless for at least an hour It could be made quite as effective, they declared, as a revolver or a blackjack"

THE SMOKE NUISANCE

The control of smoke in cities has always been imposed on the Department of Health on the ground of its unhealthfulness, but when a doctor is asked for a bill of particulars he does not make out a convincing case The New York *Times* of February 18 discusses the smoke nuisance editorially and says

"We all know that Smoke is a Nuisance Just how much of a nuisance, and why, the Mellon Institute at Pittsburgh is at pains to point out in a pamphlet from which our local Department of Health gleans the following seven-point summary

"1 Lowers resistance to disease

"2 Injures buildings

"3 Destroys real estate values People move into the suburbs, where they can get a look at the sun once in a while

"4 Depreciates merchandise and increases the cost of its care (That is a point our New York merchants have often made against the local smoke evil)

"5 Increases soap bills and cleaning bills, and so adds to the cost of living

"6 Injures trees

"7 Increases the community's electric light bill

"Pittsburgh ought to know It had a smoke problem of its own once."

It is somewhat surprising that the Mellon Institute said nothing about the smoke excluding the ultra violet rays of the sun

---

THE ANTIVIVISECTION BILL

A hearing on the antivivisection bill was held on February 12 in Albany The New York *Times* of February 13, describing the hearing, said

"Antivivisectionists, in suggesting that surgeons do their experimenting on murder convicts awaiting execution, invoked the name of Lincoln today in an effort to have the Assembly Codes Committee approve liberation of dogs from the experimental knife on the birthday of the emancipator

"For once, however, at a public hearing on the time-honored bill to outlaw experiments on dogs the attending opponents of the measure, headed this year by Dr Simon Flexner, director of Rockefeller Institute, outnumbered

the anti-vivisection group and marshaled an array of medical lore to prove the value of dogs in the operating room

"Dr Wilbur J Murphy, who said he was a general practioner representing the New York Anti-Vivisection Society and the Bronx Kennel Club, said he knew of no accomplishment in medical knowledge that could be traced to experimenting on the living dog

"Ten million Christian Scientists and the great increase in chiropractice are the results of the popular reaction against vivisection," he declared

"The bronchoscope to extricate from the windpipe objects accidentally swallowed was exhibited as an instrument, the use of which was made possible by experimentation on dogs, and medical experts testified to an increasing control over human diseases through surgical studies of the animals"

CHILDREN'S DEATHS FROM AUTOMOBILES

Figures for children's deaths caused by automobiles were given out by the Police Department of New York City on February 10 and are reported the next day by the New York *Times* as follows

"More children lost their lives in 1928 by crossing streets in the middle of blocks than from any other cause, according to figures compiled by the Police Department and made public yesterday by Acting Commissioner Philip D Hoyt.

"Safety campaigns carried on in the schools by the police with the cooperation of the school authorities have resulted in a steady decline in the number of fatal highway accidents in which children of 16 and under were the victims More than 40 per cent of the 325 children who lost their lives last year in street accidents were 6 years old or under and therefore not under the supervision of the schools

"In most cases there has been a decrease in deaths and injuries in 1928 compared with 1927, but the figures still are high and reductions can be made only by continually warning children against engaging in unsafe practices They should be taught to confine their play to the safe places set aside for them, such as playgrounds, parks and play streets

"The total of 325 marked a decrease of eighty-three fatalities compared with 1927—the greatest reduction that has been made in six years Pointing out that there were 453 children killed by automobiles in 1923, Mr Hoyt declared the figures for last year were especially remarkable, since automobile registration had increased more than 100 per cent since 1923 and school enrolments had risen at the rate of from 17,000 to 20,000 annually"

Educational campaigns in Safety First are producing results in New York City

DEPARTMENT OF SANITATION FOR NEW YORK CITY

Leaders in public health work have often protested against the old practice of requiring Health Departments to assume control of street cleaning, garbage collection, sewage disposal, and other sanitary measures whose direct connection with health is problematical The City of New York has long been planning to relieve its Health Department of many of those duties, and after considerable study, has sponsored a Legislative bill to create a new Department of Sanitation to have control of sewage, garbage, and street cleaning the New York *Times* of February 19 says

"The proposed legislation would have the effect of centralizing in the sanitary commissioners, supervision of all these functions which up to the present time have been largely under control of the several borough heads The measure was referred to the cities committee in both branches of the Legislature.

"The Board of Estimate already has made an appropriation of $600,000 for this work, and at the present time the committee is engaged in a survey of the various types of incinerators and their possible locations in the five boroughs of the city through the board's recent $8,500,000 appropriation for such improvements

"Many large cities throughout the country were visited last year on an inspection of their garbage and sewage disposal plants, incinerators and street-cleaning methods, and it was as the result of a report on this inspection that the preliminary appropriations were voted by the board"

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

THE DIABETIC LIFE: ITS CONTROL BY DIET AND INSULIN. A Concise Practical Manual for Practitioners and Patients. By R. D. LAWRENCE, M.A., M.D. Fourth Edition. Octavo of 138 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1928. Cloth, $2.50.

DISEASES OF THE BLOOD. By A. PINEY, M.D. Octavo of 195 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1928. Cloth, $4.00.

THE CLINICAL EXAMINATION OF THE NERVOUS SYSTEM. By G. H. MONRAD-KROHN, M.D. Fourth Edition. 12mo of 209 pages, illustrated. New York, Paul B. Hoeber, Inc., 1928. Cloth, $2.50.

RÖNTGENOLOGY. Its Early History, Some Basic Physical Principles and the Protective Measures. By G. W. C. KAYE, O.B.E., M.A., D.Sc. 12mo of 157 pages, with 49 illustrations. New York, Paul B. Hoeber, Inc., 1928. Cloth, $2.00.

THE CARE OF THE CHILD. By ALTON GOLDBLOOM, B.A., M.D. 12mo of 240 pages. London and New York, Longmans, Green & Company, 1928. Cloth, $1.50.

EUROPEAN CLINICS. Editorial Staff of European Clinics, 1927. Dr. WILLIAM LINTZ, Brooklyn, N. Y., Editor-in-Chief. Octavo of 347 pages, illustrated. Philadelphia and London, J. B. Lippincott Company, 1928.

THE PRACTICAL MEDICINE SERIES. Comprising Eight Volumes on the Year's Progress in Medicine and Surgery. Series 1927. Chicago, The Year Book Publishers, 1928. General Medicine. Edited by GEORGE H. WEAVER, M.D., and others. 12mo of 332 pages, illustrated. Cloth, $3.00.

THERAPEUTIC ANTITOXINS, OPSONINS, CHEMICAL, PHYSIOLOGIC AND PATHOLOGIC STUDIES. By DR. GEORGE E. BROWN and EDGAR V. ALLEN. 12mo of 219 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1928. Cloth, $3.00.

THE KAHN TEST. A Practical Guide. By R. L. KAHN, M.S., Sc.D. Octavo of 201 pages. Baltimore, The Williams & Wilkins Company, 1928. Cloth, $4.00.

QUANTITATIVE LABORATORY METHODS. By the Late Professor LEHMANN-CORTI. Authorized translation from the general part of 6th revised edition, by RALPH E. CRISPIN, Ph.D. Edited by ROGER ADAMS and HAVS T. CLARKE, Ph.D. Baltimore, The Williams & Wilkins Company, 1928. 469 pages, illustrated. 8vo. Cloth, $6.50. (The World Wide Chemical Translation Series. No. 2. Edited by E. EMMET REID.)

STERILITY IN WOMEN. Diagnosis and Treatment. By SIDNEY FRENCH, M.D. Octavo of 133 pages, with 25 illustrations. New York, William Wood & Company, 1928. Cloth, $3.50.

ULTRA-VIOLET RADIATION AND ACTINOTHERAPY. By ELEANOR H. RUSSELL, M.D., and W. KERR RUSSELL, M.D. Third Edition. Octavo of 648 pages, illustrated. New York, William Wood & Company, 1928. Cloth, $6.50.

RÖNTGENOLOGY. The Borderlands of the Normal and Early Pathological in the Skiagram. By ALBAN KÖHLER, Prof. Dr. med. Rendered into English from the Fifth German Edition by ARTHUR TRUMBULL, M.A., B.Sc., M.B. Octavo of 555 pages, illustrated. New York, William Wood & Company, 1928. Cloth, $14.00.

SURGICAL CLINICS OF NORTH AMERICA. Vol. 8, No. 6. December, 1928. (Pacific Coast Surgical Association Number.) Index Number. Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues), cloth, $16.00 net; paper, $12.00 net.

CHILD HEALTH AND CHARACTER. By ELIZABETH M. SLOAN CHESSER, M.D. 16mo of 204 pages. New York, Oxford University Press, 1927. Cloth, $1.50.

QUALITATIVE AND VOLUMETRIC ANALYSIS FOR MEDICAL STUDENTS. By H. LAMBOURNE, M.A., M.Sc., and J. A. MITCHELL, M.Sc. 12mo of 64 pages. New York, Oxford University Press, 1928. Cloth, $1.50. (Oxford Medical Publications.)

A HANDBOOK FOR THE DIABETIC. By ALBERT H. ROWE, B.S., M.S., M.D. 12mo of 129 pages. New York, Oxford University Press, 1928. Cloth, $2.50. (Oxford Publication.)

METHODS OF BIOLOGICAL ASSAY. By J. H. BURN, M.A., M.D. Octavo of 125 pages, illustrated. New York, Oxford University Press, 1928. Cloth, $2.55. (Oxford Medical Publications.)

LIPIODOL IN THE DIAGNOSIS OF THORACIC DISEASE. By F. G. CHANDLER, M.A., M.D., and W. BURTON WOOD, M.A., M.D. Octavo of 133 pages illustrated. New York, Oxford University Press, 1928. Cloth, $3.50. (Oxford Medical Publications.)

NOUVEAU TRAITE DE MEDECINE. By G. H. ROGER, FERNAND WIDAL and P. J. TEISSIER. Fasc. XVI. Pathologie du foie et des voies biliaires. Octavo of 1043 pages, illustrated. Paris, Masson et Cie, 1928. Cloth, 125 francs.

I. HUMAN CONSTITUTION. Its Significance in Medicine and How It May Be Studied: II. The Influence of Sex in Determining Human Disease Potentiality. III. The Patient and His Physician. By GEORGE DRAPER, M.D. Octavo of 75 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1928. (The Beaumont Foundation Lectures—Series No. 7.)

A TEXT-BOOK OF SURGICAL DIAGNOSIS. Edited by A. J. WALTON, M.S., F.R.C.S., B.Sc. Two octavo volumes of 1121 pages, illustrated. New York, William Wood & Company, 1928. Cloth, $20.00.

PARATHESIS: COMPENSATIONS AND ANTAGONISMS IN DISEASE. By EDWARD C. B. HOTSON, M.D., B.S. Octavo of 348 pages. Philadelphia, F. A. Davis Company, 1929. Cloth, $3.50.

the anti-vivisection group and marshaled an array of medical lore to prove the value of dogs in the operating room

"Dr Wilbur J Murphy, who said he was a general practioner representing the New York Anti-Vivisection Society and the Bronx Kennel Club, said he knew of no accomplishment in medical knowledge that could be traced to experimenting on the living dog

"Ten million Christian Scientists and the great increase in chiropractice are the results of the popular reaction against vivisection," he declared

"The bronchoscope to extricate from the windpipe objects accidentally swallowed was exhibited as an instrument, the use of which was made possible by experimentation on dogs, and medical experts testified to an increasing control over human diseases through surgical studies of the animals"

DRYCO

"COW'S MILK AT ITS BEST"

AN unrivalled record of results over a period of many years, has definitely established the fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases.

It is significant that this milk has long maintained steadily increasing prestige with the medical profession and is prescribed by leading pediatrists all over the world.

OUR NEIGHBORS

A SPECIAL HEALTH TRAIN IN TEXAS

The December issue of the *Texas State Journal of Medicine* has the following description of a special health train —*Editor's note*

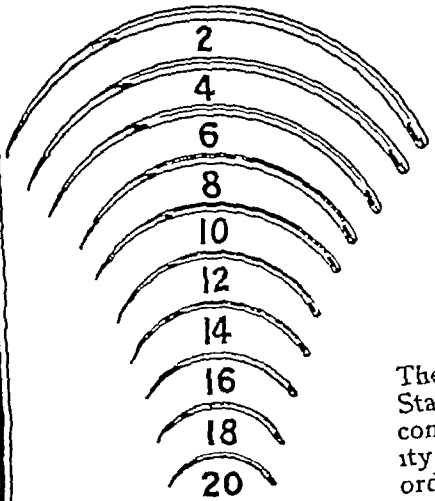
The first page of a folder describing the third annual Missouri Pacific Health "Special" says "The Missouri Pacific Lines, in cooperation with the Texas State Department of Health, will operate over our lines in Texas, a special train, conveying a comprehensive message designed to stimulate increased interest, in the strictest observance by the people of the state, of all advanced rules and regulations of better health and sanitation"

Before the tour of the better health special train was started, letters were sent to the station agents of the towns where stops were to be made, and literature was mailed to the various civic organizations, schools, and public health groups of these towns

The selected groups in these towns then arranged for the proper and orderly handling of the crowds upon the arrival of the train Placards bearing the date and time of arrival, and departure of the train were placed in conspicuous places about the town, several weeks before its arrival

The train was composed of seven cars, the first of which, a chair car, was used as a buffer but, at times, was brought into service as a lecture car The second car, a baggage car, carried the supplies of the train The third car was especially prepared by Dr Clarence E Smith, of the United States Public Health Service for the demonstration of measures of milk sanitation Two chair cars were next, which were used as lecture cars The sixth car was especially fitted out, containing models and placards, presently to be described, on typhoid fever, malaria prevention and rat control This car was the one into which the public was first shown The last two cars were for the personnel of the train, and consisted of a dining car and obervation Pullman car

The two exhibit cars contained more than eighty separate displays and exhibits In the front end of the first car were models of mosquitoes, made chiefly of wood, in characteristic poses Models of the common Culex mosquito and of the Anopheles mosquito were shown, emphasizing the differences in the lighting postures of the two species and some of the other easily recognized differences These models drew a wide range of comment Beside these mosquito models were models of their respective eggs, showing the differences as usually recognized In tanks about two feet square, and two feet deep, were kept some live Gambucian Affinis, or what is usually spoken of as pot-bellied minnows In reality, these are grown fish In vials near this tank were specimens of these fish in their various phases of life The specimens were preserved in alcohol Fly swatters were given to each lady visiting the exhibit



Various kinds of rat and mouse traps were exhibited and the proper method of baiting them was explained

Pamphlets describing malaria and yellow fever, and the rôle of the mosquito in the transmission of these diseases, were handed out to everyone who visited the train The prevention of malaria, by killing the mosquito or destroying its breeding places, was discussed In this connection, the use of the small fish as a means of doing away with the mosquito larvae, the value of cleaning grass around ponds, draining stagnant pools, and covering rain barrels and cisterns was clearly brought out Demonstrations of poorly screened windows and the contrast of well screened ones were shown The need of a small size of wire mesh was emphasized in the models and exhibits In connection with the mosquito exhibit, as a practical demonstration of malarial prevention, were models of farm places, showing poorly arranged farm buildings, ponds with grass growing around the edges, and uncovered rain barrels and cisterns In contrast to this, models of well-kept premises with everything in accordance with the recognized principles of sanitation, were exhibited

The third car of the train contained the milk exhibits Here were placards advising the drinking of a quart of milk a day, and the use of more milk and its products in the daily diet, more especially in the case of the younger children Models of pure and impure milk were shown The correct bottling of milk was demonstrated There were also models of sanitary barns for the cattle, demonstrating the proper arrangement of the stalls Model milk pails were exhibited

At the entrance to the first exhibit car was some one of the train's personnel, usually Mr Tom S Bond, assistant chief engineer, Missouri Pacific Lines, who directed traffic, as it were, and who held the official counter, checking each person who visited the train Usually the visitors were asked to line up, in single file, with the youngest school children going through the train first Lectures were not given to the very young children After the people passed into the first car (the sixth of the train) they were requested to move slowly through this car, observe the models on either side, and pass the second lecture

Any Artistic Workman Can Produce a Handsome Artificial Limb

But what about fitting the stump? What about the alignment of the artificial limb? What about durability? What about pressure at the sensitive points? Not to mention such important matters as the special care of the stumps of diabetic patients

The manufacture of artificial limbs is a science as well as an art. Mastering it is the work of a lifetime. The house of A. A. MARKS, Inc., has given three generations to this work, and respectfully places its skill at the disposal of your patients

car ahead and be seated As soon as this car was filled, some one of the physicians of the train personnel lectured for about five minutes on the ordinary communicable diseases of childhood, and some aspects of other public health problems, especially birth and death registration. Of the communicable diseases discussed, special emphasis was placed on vaccination against small pox and immunization against diphtheria Measles and scarlet fever were also discussed The greater number of these lectures were given by Drs J C Anderson, Oscar Dowling, E B Parsons, A H Flickwir, J A King and S P Cunningham

After this car was filled the second lecture car was opened to the visitors and lectures on safety and accident prevention were given here The importance of crossing railroads at the points designated by the railway was stressed, as was the necessity for looking carefully in both directions before crossing the tracks Messrs J P LaBarge, L A Henry and L Q Linson delivered most of the lectures on these subjects

Each town was allotted a certain period of time for the train to remain there This period was governed chiefly by the population of the town It was necessary, in some places, to lecture to the public on the station platforms and outside the train, because the crowds in attendance were greater than had been anticipated, and it was imperative that the original schedule be maintained The schedule was adhered to practically throughout the twenty-six days of the tour In a few places some of the train officials visited the schools and colleges and gave lectures. The train was greeted everywhere with enthusiasm and attention The crowds were most orderly and well behaved Committees met the train practically everywhere and gave it a formal welcome

To recapitulate somewhat, the train covered about 2,500 miles in 26 days, and visited 110 towns By actual count, 63,450 persons were shown through the train Over 150,000 health educational pamphlets were distributed, and about 10,000 fly swatters were given out

Before the tour of the Better Health Special was completed, some striking visible results began to show themselves Immediately following a visit of the train, several towns instituted the standard milk ordinance, as promoted by Dr Clarence E Smith That the tour accomplished great good there can be no doubt, however, most of its accomplishments cannot be pointed out as tangible, but are results which are obtained by more accurate knowledge of public health problems, better health, better sanitation, fewer accidents and more rightful living, generally

(Continued from page 302—adv xx)

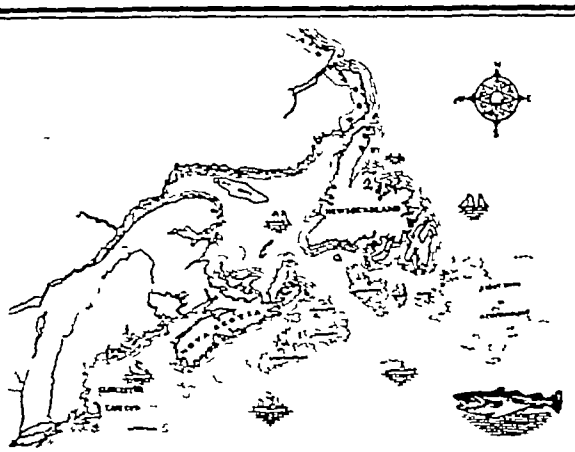
corrected while only 22 per cent of the total number found were corrected.

"From one association came the report that 24 defects in one child were discovered at a clinic by three prominent physicians who agreed something must be done to save serious trouble later These defects were nineteen carious teeth, some rotted to the gum, a hernia, a spinal curvature, heart trouble, diseased tonsils and adenoids The mother, quite concerned, went to her own physician who laughed at the findings of the other doctors Thus we have a child probably doomed to a life of ill-health while men of science differ

"One city reported that in 1926 a committee was appointed to interview the physicians and secure their cooperation but none of these with the exception of the county health officer seemed in favor of a Round-up so the project was not pushed In 1927 it was decided by the associations in that city to send the children to their own physicians But with few exceptions the mothers, who took their children to their physician, were sent home without an examination, one doctor even tearing up the examination blank and throwing it into the waste basket. Not discouraged, in 1928 the parent-teacher workers in this city selected the physician who had been most radical against the Summer Round-up in former years and he with the county health officer and a dentist conducted a clinic charging $1 for each child examined and the defects were corrected by the family physician Credit should be given to this man who was willing to acknowledge thus publicly that he had been in error

"Let us state the ways in which the medical profession may be helpful in making the Summer Round-up of benefit to the future citizens of Iowa.

"1 By helping to bring to the attention of parents the benefits to their children of an early correction of physical defects



"2 By taking the initiative in making plans for a Round-up which will meet local conditions

"3 By showing a sympathetic attitude toward volunteer workers who in their enthusiasm sometimes make mistakes

"4 By active support of legislation looking toward a public health nurse in each county to direct follow-up health work

"5 By helping to make possible the ultimate aims of the Round-up—that each child from birth to maturity shall have an annual positive health examination"

New York State may profit by the example set by Iowa in making provision for bringing medical service to school children Iowa affords an excellent example of co-operation between the medical profession and lay health organizations

The American Cod Liver Oil Map

THERE was a time, not so very long ago, when the fallacy existed that America could not produce good cod liver oil.

The Patch workers exploded that theory and helped to revive an old American industry This required a combination of research work and the development of new methods for making oil.

The results have been noteworthy An American Oil of the highest vitamin potency and—by improving the method of production—an oil of pleasant taste

Along the shore line, from Cape Cod to Labrador, are the Patch plants—where the oil is obtained from the fresh livers Out on the Banks are the stream trawlers equipped with the Patch cooker, where the oil is made soon after the fish come out of the water

To increase resistance against disease and to build up energy after influenza and similar conditions—Patch's Flavored Cod Liver Oil, with its high Vitamin A content, is particularly valuable.

You should taste this fine American product, so send for a sample, and with the sample we will send you the whole story of how Patch put America on the cod liver oil map

The
"Pomeroy"
Supporting Corset

A good corset, properly made and fitted, not only gives needed support to the vital organs, but moulds the figure to correct and graceful lines

The Pomeroy is ideal for this purpose, for it is so designed that the uplift is given by the corset itself with no need for additional belt or other contrivances The intersecting laces give an extra upward and backward lift which further helps the muscles of the abdomen to give the necessary support

PARENT-TEACHERS ROUND-UP OF IOWA SCHOOL CHILDREN

A conference of the County Secretaries of the County Societies of Iowa was held in Des Moines on December 13, 1928, at which the broad topic discussed was how to advise with state officers of lay agencies in securing proper medical guidance and aid in various local health activities Among the subjects discussed was a round-up of school children by the Parent-Teachers Associations The following descriptions of the work are taken from the January issue of the Journal of the Iowa State Medical Society

"The idea of the Round-up is to send into the beginning grade of each school a class of children who are free from remediable physical defects

"The plan provides for a survey of the school district in the spring to secure the names and addresses of the children who will enter school for the first time the following fall, to have these children examined in the spring for physical defects, have such defects as are remediable corrected during the summer and a check-up in the fall to determine what corrections have been made In 1925 there were 102 associations in twenty-two states enrolled in this campaign, while, in 1927, 2120 associations in forty-four states conducted a round-up in which 13,520 children were examined and 6,173 defects were corrected

"Early in the year a conference was called of representatives of those groups which could be expected to be interested in the conduct of the Round-up

"Following this conference a letter was sent by the chairman of the Child Hygiene Committee of Iowa Congress to the president of each local association explaining the Round-up and enclosing a copy of the method of procedure This method of procedure suggested that the approval and cooperation of school officials and Medical and Dental Societies in each county or local physicians in each town should be secured before undertaking the work It also advised that parents should be encouraged to take their children to their family physician and dentist for examination

"Letters were sent by the Iowa Commissioner of Health, to all County Medical and Dental Societies, and by the Director of the Division of Public Health Nursing to all Public Health and School Nurses explaining the Round-up and asking their support of it in their communities As a result 123 Parent-Teacher Associations registered for the 1928 Round-up These represented 49 communities, 88 in cities, 33 in towns and 2 in rural communities

"It may be interesting to state that 68 per cent of the defects found by the family physician were

The Cardiologist's Choice

Pil. Digitalis

(*Davies, Rose*)

Physiologically tested leaves made into physiologically tested pills

Convenient, uniform and more accurate than tincture drops

Prescribe *"original bottle of 35 pills"* which protects the contents from exposure from the time of manufacture to the time of administration. This further insures dependability of action

Each pill contains 0 1 gram, the equivalent of about 1½ grains of the leaf, or 15 minims of the tincture **Sample and literature upon request.**

DAVIES, ROSE & CO , Ltd
Pharmaceutical Manufacturers, BOSTON, MASS

As a General Antiseptic

in place of
TINCTURE OF IODINE
Try

Mercurochrome-220 Soluble

(Dibrom-oxymercuri-fluorescein)
2% Solution

It stains, it penetrates, and it furnishes a deposit of the germicidal agent in the desired field

It does not burn, irritate or injure tissue in any way.

Hynson, Westcott & Dunning

Baltimore, Maryland

MALPRACTICE SUITS

Why are malpractice suits brought? The *New England Journal of Medicine* discusses this question in its January 10 issue and says

"In the practice of medicine there will always be, in the nature of the art, a large field in which, if the physician chooses to do wrong, no one but he will know about it, until the Day of Judgment No amount of enactment of specific regulation can appreciably limit this field without changing the nature of the art of healing It is therefore of the utmost importance to have the right kind of physician

"The earliest responsibility then falls on the medical school, to restrict its degree to those who are morally and ethically qualified to practice medicine The difficulty of making this determination does not absolve the school from responsibility The next responsibility, in Massachusetts, falls on the Commonwealth, to restrict the license to practice to those who meet high standards The medical practice act should be modified so that a high-minded and efficient Board of Registration can restrict the licenses to those well qualified in every way to engage in the practice of medicine. There are crooks and shysters practicing medicine, but the legal profession has its responsibility also in this regard, with its share of these 'undesirable citizens' Legal procedure also is to blame, for jury trial does not always mean justice

"It may be that the prime movers in the malpractice suits are the patients who really feel that they have not been treated justly by their physicians

"But the situation is so serious in Massachusetts today, that the medical profession, through its present organization, or, if for any reason that is inadequate, through special organization, should make as thorough a study as possible What are the facts? Every claim should be investigated as thoroughly as possible, and all the information collected for study Who is responsible for starting the suit? Patient, patient's family, lawyer, another physician? Especially the responsibility of the physician should be investigated Is medical practice as bad as it would seem to be from the number of claims filed? Are the insurance companies stimulating suits to get physicians to take out insurance with them? Many of these facts are doubtless available already, but they should be set before the organized medical profession for consideration"

The NEW YORK STATE JOURNAL OF MEDICINE offers the explanation that the most frequent cause of malpractice suits is a disparaging remark made by a second doctor regarding the work of the first doctor that treated a case.

Patient Types . . .

The Chronic

They have worn holes in the carpets of many a waiting room and frayed the physicians' patience to shreds.

Often, underlying the chronic condition is bowel stasis and irrational use of harsh cathartics.

In such cases many chronics have been definitely benefited by a period of "habit time" education together with other rational treatment.

The use of Petrolagar will materially shorten the period of bowel re-education. A few of the advantages of using Petrolagar over plain mineral oil are its palatability, its more thorough permeation of the feces, less danger of leakage, and it has no deleterious effect on digestion.

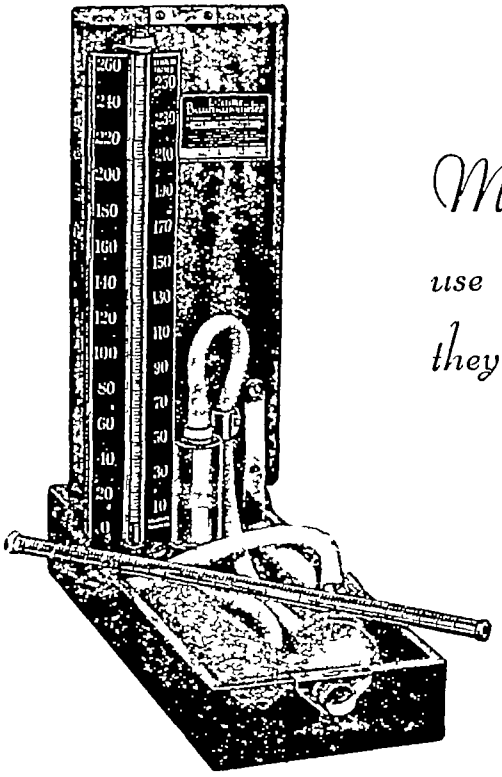
STUDENT MEDICAL SERVICE IN OHIO STATE UNIVERSITY



Medical service to college students is receiving an increasing amount of attention from college authorities and medical societies The Council of the Ohio State Medical Association appointed a special Committee on Student Medical Service, whose report is printed in the February issue of the *Ohio State Medical Journal,* from which the following excerpts are taken,—*Editor's note*

This committee has not only field several conferences but has assembled much correspondence and numerous documents bearing on the development of the student medical service at Ohio State University and elsewhere, and has reviewed in detail the consideration previously given to this general question by our State Association

We are all mindful of the thoughtful intent of the Board of Trustees of Ohio State University and of other officials of the University in providing some sort of supervision over the physical well-being of the thousands of students enrolled each year at that institution

We are in accord with the purpose of a plan of health supervision which will minimize and control communicable diseases in the University district, that will advise students about health problems, and when needing medical or surgical services refer them to reputable and qualified practitioners, that will teach proper hygiene and sanitary principles, that will emphasize the importance and value of frequent or periodic health examinations, that will render emergency and casual medical service to the students when on the University campus, that such service should be emphasized as emergency aid, advisory and preventive rather than curative medical practice, and that the student health service be attached to and under the supervision of the College of Medicine of the University

We suggest that a twenty-four hour telephone service, especially for handling night calls and reference of students requiring medical and surgical service, be inaugurated and maintained in connection with and under the supervision of the Student Medical Service, probably at the University Hospital, and that physicians referred by such call bureau be employed by the student patients on a private pay basis

Why not start now?

Most of the doctors in your town use the Baumanometer When they "take" blood pressure they get it —quick!—exactly

PAY IN WORKMEN'S COMPENSATION CASES

The physicians of Massachusetts, as well as those of New York, are deeply concerned over the repudiation of their charges by insurance companies The Court of last resort of Massachusetts has decided that a surgeon treating an injured employee in a free ward of a hospital cannot make a charge for his services

Physicians are glad to give their services free to those who have no means to pay An injured employee has the means to pay for his medical treatment, for that is the object of the Workmen's Insurance law Commenting on these principles, an editorial in the January 17 issue of the *New England Journal of Medicine* says

"Since there is a common and growing custom of permitting members of a hospital staff to charge for the care of private patients, physicians may, it seems to us, properly charge for services for injured workmen insured under the present laws pertaining to accident insurance, even though hte patient has not selected his personal physician

"If the profession and hospitals are agreed on this matter an effort should be made to secure payment to doctors for services in these cases

"We fail to see why competent physicians should be obliged to give professional service to any one who is not in the class of those who are entitled to charity

"The present laws relating to accident insurance are the result of efforts to deal justly with all concerned and we may confidently expect that the Industrial Accident Board will not obstruct efforts to have the laws changed in order to provide payment for reasonable charges by physicians It will of course become necessary to show that the charge of staff doctors is reasonable

"The insurance companies and perhaps the employers may not look favorably on any added costs to them, but we can see no reason for objection by the Board or the Courts Both now act in conformity with the interpretation of existing laws These laws have been amended from time to time Further changes may be in order"

In pneumonia
Start treatment early

In the

Optochin Base

treatment of pneumonia every hour lost in beginning treatment is to the disadvantage of the patient. Valuable time may often be saved if the physician will carry a small vial of **Optochin Base** (powder or tablets) in his bag and thus be prepared to begin treatment immediately upon diagnosis.

THE AMERICAN MEDICAL LIBERTY LEAGUE, INC

The *Wisconsin Medical Journal* for February contains a warning against the American Liberty League of 59 East Van Buren Street, Chicago, Illinois The Journal reproduces a letter from the secretary of the League whose letterhead is as follows

"American Medical Liberty League, Inc
A Citizens' Movement for Medical Liberty
on the same Basis as Religious Liberty
Endorsing the Principles and Aims of the
the Anti-Vivisection Societies"

The explanatory warning in the *Wisconsin Journal* reads

"On the first of the year all members of the Wisconsin Legislature received a mimeographed letter from a Mrs Lora C Little, Chicago, Secretary of the American Medical Liberty League. The letter urged the legislators to oppose legislation suggested by the American Medical Association Enclosed with the letter was a 66 page pamphlet on 'Doings of Doctors' written by one George Starr White, M D, 'F.R S.A., London,' whose address is given as Los Angeles, California.

"The letter is probably a preliminary step towards the introduction of measures in the interests of the cultists and possibly aimed to prevent vivisection, and limit vaccination and quarantine methods One H J Michaels is listed as the Vice President of the League for Wisconsin While no address is given, an H J Michaels is a chiropractor in this state

"The pamphlet enclosed with the letter is composed of a series of 'case reports' with such titles as 'Spinal Puncture—Dead Child,' 'Killed to Cure a Pimple,' 'Black Smallpox Hocus-Pocus,' 'Why Trust Doctors Control Hospitals,' 'Healthy Child Dies of School Inspection,' 'Smallpox Scares Built to Sell Vaccines,' 'Depraved Work of Doctors in High Standing,' etc.

"The American Medical Liberty League was exposed in the *J.A.M.A*, 1922, in which article it was stated that White was previously a second vice-president of the Allied Medical Associations in 1918 He graduated in 1908 from New York Homeopathic at the age of 42 and has been at times an advocate of 'spondylotherapy' 'zone therapy,' and of 'Bio-Dynamo-Chromatic-Diagnosis' The *J.A.M.A* declared that the letters F S Sc London, used in 1922 'carry with them an air of erudition and mystery that is well worth what they cost' They mean 'Fellow of the Incorporated Society of Science, Letters and Arts of London, Ltd' The 'Fellowship' is held by not a few 'patent medicine exploiters in the United States It costs one guinea ($5)' White was expelled from the Los Angeles County Medical Association in 1916 following his conviction in 1915 of practicing medicine without a license in Chicago"

LEGISLATIVE PROBLEMS IN OHIO

The first article in the February *Ohio State Journal* describes medical legislation in that state and says

'As an outgrowth of the joint legislative committee on economy in public service, which has surveyed all branches and divisions of the state government in the interim between the last legislative session and the start of the present one, a number of bills have been introduced and still others are expected As some of these will have a direct bearing on the State Medical Board, the State Department of Health, the State Department of Welfare, the State Industrial Commission, and many other departments of state in which problems of public health and medical practice are involved, the Policy Committee and the headquarters of the State Medical Association will follow these complicated proposals through their legislative course

"Judging by the unusual activity of various groups and cults there will be a greatly increased number of bills seeking 'special privilege' There is of course the new initiated chiropractic bill, a Christian Science proposal, a new osteopathic measure and proposals are expected from the anti-vaccinationists, anti-vivisectionists and others Then, too, there will be a number of more or less radical proposals in the field of 'socialization,' with more expense to the taxpayer, more functions of government more duplications, and exploitation of un-American ideas

"The Policy Committee and the headquarters of the State Association will closely watch all legislation as in the past, and will communicate developments and suggestions to the legislative chairman in each county medical society and academy It is his function, together with the other local officers, committees and membership, to cooperate in the united legislative policy of the Association '

JAMES THOMAS WRIGHT, M.D

TUBERCULOSIS IN KENTUCKY

The *Kentucky Medical Journal* for January contains an editorial on tuberculosis work in Kentucky, from which the following extracts are taken *Editor's note*

The treatment of early cases is almost completely dependent upon education It is only recently that physicians have given the patients the systematic and thorough examination that recognizes this disease in its incipiency when it responds most readily to treatment It is now the recognized duty of the physician to thoroughly examine the chest in every patient who presents any of the elusive symptoms of this insidious disease

Leadership in the campaign against tuberculosis has been wisely furnished by the Kentucky Tuberculosis Association in the past year, in co-operation with the county medical societies and county health departments Diagnostic clinics have been held in thirty-six counties Most of those examined were known contacts with active cases of tuberculosis This campaign has been largely financed by the sale of the Christmas Seals and the result secured has cost as little as any other public health activity with which we have ever been acquainted

The care of the advanced case presents many problems This is particularly true in a state like Kentucky where unfortunate political influences have created a very large number of poor counties Many of these counties have such meagre incomes that they are unable to attack successfully any of their problems whose solution costs any money Here again the leadership of the Kentucky Tuberculosis Association has been especially effective in the past few years More than 300 patients are now getting well in open air shacks and sleeping porches that have been built upon the advice of this organization The excellent results secured in Louisville and Lexington by the Sanatoria indicates the necessity for more liberal appropriation for beds for the tubercular and an enlarged state institution The State Tuberculosis Sanatorium at Hazelwood, near Louisville, is splendidly and economically conducted, but is only available for patients who can pay $15 per week, from which it derives its support

Vol 29, No 6 NEW YORK, N Y. March 15, 1929

PERNICIOUS ANEMIA; DIFFICULTIES IN DIAGNOSIS FROM A NEUROLOGICAL STANDPOINT.*

By N W WINKELMAN, M.D, PHILADELPHIA, PA., and JOHN L ECKEL, M.D, BUFFALO, N Y.

From the Graduate School of Medicine, University of Pennsylvania, and the Wards and Laboratory of Neuropathology, Philadelphia General Hospital.

THE rapid strides recently made in the treatment of pernicious anemia make it all the more important to diagnose the disease early and to differentiate it clearly from conditions with which it may be confused For this reason stock taking of our diagnostic ability should be made at this time from all angles

The earliest symptoms of pernicious anemia are the most important from a therapeutic standpoint Three different systems may show the earliest manifestations and it may be limited to a system for a long time First, the most common form is that in which the blood picture change predominates Second, those cases in which gastro-intestinal manifestations antedate the blood picture Third, those in which the first manifestations concern the nervous system

Because of the great variability in symptoms and systems involved, various other diseases may at times be mimicked It is well known that the differentiation between the blood picture of a primary and secondary anemia is not easy There are many conditions, such as cancer, syphilis, severe hemorrhage, pellagra, pregnancy, severe sepsis, intestinal parasites, tuberculosis, focal infections and leukemia that may so closely resemble the blood picture of pernicious anemia that one cannot differentiate them from that standpoint alone The above conditions have a tendency to low color index, but this alone cannot always make the differentiation A blood picture showing the following is extremely suggestive of pernicious anemia a marked diminution of red cells, a variation in their size, i e (microcytes, macrocytes, anisocytosis, poikilocytosis), polychromatophilia, megaloblasts, nucleated red cells, diminution of blood platlets, diminution of white cells with relative lymphocytosis and a high color index

Of all the above blood changes, the two most important and constant signs are the high color index and variation in the morphology of the red cells Pernicious anemia cannot as yet be regarded as a definite disease entity, nor as having a definite etiology. It is more the expression of a selective toxemia manifesting itself at a number of points in the body, affecting each one differently It apparently involves first the bone marrow, resulting in hemolysis and this condition in turn prevents an adequate blood regeneration Again the toxin may first affect the nervous system, producing changes in the spinal cord and peripheral nerves, and in still others it may involve other organs, particularly the gastro-intestinal tract

With reference to the gastro-intestinal tract, Grinker,[1] Bailey[2] and others have contributed excellent pieces of research to the subject. Whilst most investigators report approximately 100 per cent of cases of pernicious anemia with absence of free hydrochloric acid, still there is undisputed evidence in the literature that in the neighborhood of from 3 to 5 per cent of cases have had free hydrochloric acid present in varying amounts Achlorhydria may precede the anemia for from months to years The achylia of pernicious anemia when present is complete and is not relieved during remissions It is apparently not dependent upon the blood picture

Arriving at the main discussion of this thesis, that is, difficulties in diagnosis, we have selected a number of cases from our series which serve to illustrate some of the troubles encountered in arriving at a correct diagnosis Each of the cases presented has been autopsied, so that in addition to the clinical evi-

volvement of the peripheral nerves These latter authors disagree with most opinions in the literature, claiming the nervous symptoms in pernicious anemia did improve with the blood picture They presented several cases in which there was marked improvement in the nervous symptoms during a remission We can add a case of our own in which a patient was unable to walk He had marked objective sensory disturbance with subjective pain in all four extremities With improvement in the blood picture his neuritic symptoms improved and for the last two years this man has been carrying on his profession as an attorney It is our thought that when complete degeneration has occurred in the spinal cord, clinical improvement cannot take place, because regeneration in the central nervous system does not occur The improvement which takes place spontaneously or with treatment is probably dependent mainly on the subsidence of the neurotic pathology and the clearing up of the mild or incomplete cord changes

Case 2, 24-180, W F, a white male, aged 60, was admitted to the Philadelphia General Hospital five times between March 4, 1919, and his death, October 7, 1924 On the first admission he complained of shortness of breath, weakness, swelling of the feet and a slight yellowish discoloration of the skin This condition had gradually developed during a few months

Examination upon this first admission, March 4, 1919, revealed a fairly well nourished man, whose skin showed a yellowish tinge Pupils were of medium size, equal and reacted normally to light and in accommodation There was a slight systolic murmur at the apex of the heart. His lungs were clear Both liver and spleen projected a short distance below the margin of the ribs and could easily be palpated The tendon reflexes, both upper and lower extremities, were equal and very active He presented no abnormal toe signs He complained of paresthesias In the lower extremities vibration sense below the knees was lessened but not entirely lost Position and spot localization were well retained He had infected teeth, which were taken care of during the first few weeks in the hospital

Laboratory Examination Hemoglobin was 20%, red cell count 1,239,000, white 4,500 A stained smear showed many nucleated red cells, poikilocytes, also anisocytosis With diet, removal of his infected teeth and rest this man improved rapidly His blood picture likewise improved and he was discharged May 23, 1921, following which he worked as an orderly in the hospital During the spring of 1922 he again grew weak and pale and on April 26, 1922, was readmitted to the hospital At this time his hemoglobin was 24% There were 1,000,000 red cells, 6,000 white cells A blood smear showed marked variation in the size and shape of the cells with many nucleated red cells After several transfusions, diet and rest he improved rapidly Reflexes of the lower extremities at this time remained present and active Vibratory sense was practically lost There was no disturbance of position and spot localization He improved so that on November 1, 1922, he was discharged and again worked about the hospital as an orderly His improvement, however, did not last long He was readmitted about ten weeks later, January 13, 1923, complaining of headaches and weakness He soon developed gangrene of one of the toes of his right foot, which was amputated It was noted upon this admission that the tendon reflexes at knees and ankles were much reduced in their activity, but no Babinski sign was noted Following removal of the toe he improved rapidly and was discharged the third time May 24, 1923 He again worked as an orderly in the hospital His fourth admission was July 3, 1923, at which time he complained of weakness, cramps, numbness of the legs, dizziness, pain in the stomach, diarrhea and general malaise The gastric contents upon this admission showed absence of free hydrochloric acid with low total acidity There was no lactic acid The Wassermann tests of both blood and spinal fluid were negative The blood picture showed 20 to 25% hemoglobin and approximately 1,000,000 red cells A smear showed marked morphological changes with nucleated reds He was given rest and diet and improved again, so that he was able to leave the hospital on October 19, 1923, and again worked as an orderly until his fifth admission, September 20, 1924 At this time he complained of great difficulty in swallowing along with gastric distress, pain in the stomach, with diarrhea and general malaise The difficulty in swallowing began in July, 1924 He regurgitated solids These appeared to pass down the gullet for some distance before the regurgitation took place Fluids taken in very small quantities passed into the stomach Roentgenological examination at this time revealed an obstruction which was nearly complete at the lower end of the esophagus, which was thought to be malignant On September 28, 1924, a gatrostomy was done and ten days later he died Blood analysis upon last examination revealed hemoglobin 25%, 1,100,000 red cells, 4,600 white cells A stained smear revealed variation in the size and shape of the cells with many nucleated reds The urine was negative on all admissions

The blood picture in this case was suggestive of pernicious anemia There was a marked

dence we have the benefit derived from thorough pathological examination

Case Reports

Case 1 M S, a white woman, aged 70, widowed, was admitted to the University of Pennsylvania Hospital, service of Dr Spiller Her complaints were inability to walk, retention of feces and urine and tingling in the hands and feet

P H Little is known of her childhood She had eight sons, all alive and well, and there had been no miscarriages She cared for her own home and sold books to help maintain herself Her habits were good Her husband died at the age of 46 from a "stroke" Her general health had previously been good

P I. For the past three or four years she had had pain in the lower back, which radiated down the legs to her feet There was slight numbness of the feet during this time In the last year the numbness increased and weakness set in gradually, so that she had difficulty in walking For the past three weeks she was unable to walk alone Her arms and legs felt "dead" She could not tell the location of her hands or feet and was unable to distinguish objects in her hands She had a feeling of constriction about the body at the waist She had no control of sphincters She did not complain of headache There was no vomiting, no eye symptoms There were no convulsions and no vertigo She was able to talk and swallow She had no digestive complaints Her appetite was fair She had lost twenty-five pounds in the past six months

Examination showed that she was well built, rather obese She was unable to walk and was slightly deaf Mentally she was clear Her pupils were equal, round and reacted normally Both optic discs showed some pallor The retinae were normal Blood pressure was 135 systolic, 70 diastolic Heart sounds were normal The power of her limbs was greatly reduced There was neither spasticity nor flaccidity, but slight cyanosis of extremities was present in the upper limbs There was neither ataxia nor dysmetria and no astereognosis Sensitivity to touch and temperature was normal She was hypersensitive to pain in all her limbs Appreciation of vibration and muscle position was lost below the elbows and the knees The deep tendon reflexes were lost The abdominal reflexes were absent Babinski sign was present on both sides, but without ankle clonus The muscles of the calves and those of the forearms were tender to pressure and she complained of constant pain in her limbs She had to be catheterized

Laboratory Analysis The hemoglobin was 93%, red count 3,600,000 cells, thus presenting a 1 plus index, white cells 7,400 Differential, polys 68, lymphocytes 23, large lymphocytes 3, transitional 3, basophiles 1, eosinophiles 2. Stained smear failed to reveal any change in size and shape of red cells and no nucleated red cells were found Urine showed a specific gravity 1015, it was slightly alkaline in reaction, there was neither albumin nor sugar present Microscopically it was negative. Gastric analysis gave an absence of free hydrochloric acid on six different examinations Total acidity varied from 3 to 6 per cent. There was a moderate amount of lactic acid present No occult blood was found in the gastric contents Blood sugar was 109 mgm per 100 cc of blood, urea nitrogen 15 mgm There was no increase of urobilin in the urine. Course She grew worse rapidly, losing both in weight and in strength Frequent blood analyses were made during the next month These gave hemoglobin 80 to 85 per cent. Red count was in the vicinity of 3,500,000 White count 7,500 On one or two occasions a smear showed some definite variations in the size and shape of the cells However, there were no macrocytes and no nucleated reds Diagnosis of multiple neuritis with pernicious anemia was made She died rather suddenly from a left cerebral thrombosis

Postmortem examination was made one hour after death and was confined to the nervous system The brain was atrophic and showed moderate arteriosclerosis and recent thrombotic softening involving the left hem isphere in the distribution of the middle cerebral artery The spinal cord was uniformly small Microscopically, posterolateral sclerosis of the anemic type was shown by all staining methods The sciatic nerves showed definite inflammatory changes,—a real neuritis Some fibers showed early myelin sheath degeneration by the Marchi stain

Discussion This case was under observation for only a short period, during which the multiple neuritis syndrome was in the foreground However, the early history and a complete laboratory analysis suggested pernicious anemia with a complicating multiple neuritis, a not infrequent combination The blood findings by themselves were not diagnostic It was only in association with the other findings that the diagnosis was correctly made The autopsy substantiated the clinical diagnosis in this case

Up to recent times there has been but little reference in the literature to neuritis in association with pernicious anemia Von Noorden[3] in 1892, gave the first description of a case with this syndrome Later Russell, Batten and Collier[4] described a case with peripheral nerve involvement The best review is given by Hamilton and Nixon[5], wherein they describe six cases of their own, all carefully studied, in which there was in-

While syphilis is a frequent cause of such a condition, it could be ruled out in this case with considerable assurance The absence of free hydrochloric acid in the stomach made the diagnosis of pernicious anemia more than a possibility Knowing that the blood changes may not occur early in pernicious anemia, there was no doubt in the minds of those studying this man as to the diagnosis and the eventual prognosis This case occurred in 1921 before the liver diet era

As we watched the progress of this patient we expected to find the blood changes of pernicious anemia develop Innumerable blood examinations were made but at no time were the blood findings characteristic, even though the neurologic signs were progressive Even the final blood count made four days before death showed nothing that we could interpret as characteristic of pernicious anemia

Pathologic study left no doubt that pernicious anemia was the correct diagnosis In the nervous system the changes were characteristic and fully developed, so that a picture of a transverse cord lesion was present clinically and pathologically

Case 4 23-165 M B, a 53-year-old woman, was admitted to the Philadelphia General Hospital July 10, 1923, and died July 17, 1923 She showed on admission a marked anemia and very pronounced mental symptoms, with great restlessness at night Upon examination it was noted that the feet and ankles were swollen The history as to the onset of these symptoms dated back for nearly a year, when she is said to have gradually become pale and she tired on the least exertion For the past three months she had become dyspneic. Swelling of the feet and ankles had developed during the previous week

Examination Pupils were of medium size, they were round, equal and reacted promptly The optic discs were pale and the retinae contained a few small hemorrhages The tendon reflexes at the knees and ankles were increased and there was a double Babinski present. The blood Wassermann was negative The finer tests for sensation, localization and position were not reliable due to her mental condition It was noted that she was very fearful, apprehensive, restless, noisy and resistive and at times it was almost impossible to do anything with her When she talked it was in a confused manner and mixed with delusions of persecution, claiming that people were against her and that some one was trying to poison her No fabrication could be brought out

Laboratory examination showed a hemoglobin of between 15 and 20%, red count 780,000 and white cells 2,800 It was thus a high color index. Stained smear showed very marked variations in the size and shape of the red cells and there were numerous nucleated red cells found The white cells showed a relative lymphocytosis During her week's stay in the hospital her temperature was between 98 and 99° F, and her pulse was 80 to 100 She failed rapidly and died

Postmortem examination showed the brain to be pale but no other gross pathology The spinal cord showed definite areas of combined sclerosis of the anemic type The cortex showed severe ganglion cell disease, especially cell shrinkage and lipoid degeneration

Comment The interesting feature in this case was the extremely low blood count with a relatively high index and the marked mental symptoms, which had existed for several weeks before her death The feature of the mental symptoms herein described was that they did not conform to any definite mental entity They were more those of confusion, fear, and thoughts and ideas of poisoning, rather than any elaborate system of delusions There were no hallucinations present Mental symptoms developing in the course of pernicious anemia are rather rare and it has been noted by the few authors who have mentioned them, that in their experience they have never conformed to one of the definite mental groups It would appear that they are due to the toxic-exhaustive phase of the condition and that the manifestation is wholly a result of the cortical ganglion cell involvement. No foci such as found in the spinal cord could be seen in the cortex In this respect our case confirms those in the literature

Case 5 24-154 J J M, a white male, aged 65 A clerk by occupation There were thirteen children in the family He was admitted to the Philadelphia General Hospital, service of Dr M J Burns, June 24, 1922, and discharged April 18, 1923 Readmitted July 11, 1924, service of Dr Lloyd, and died October 15, 1924 The history given was that of a back injury some seven years before admission, following which there was gradual weakness of the lower limbs and later incontinence of urine On the first admission he was unable to stand and his feet were quite numb

Examination revealed pupils that were round, equal, but very sluggish in their reaction to light They were normal in accommodation There was some kyphosis of the fifth and sixth dorsal vertebrae This area was not tender The spine as a whole was quite rigid The knee and ankle jerks were absent. The arm reflexes were present There was no Babinski sign He had incontinence of urine There was ataxia of both lower extremities There was slight diminution of superficial sensation in both legs Deep sensibility was slightly impaired Vibration sense was diminished Blood pressure was 145 systolic, 70

variation in the size and shape of the cells with nucleated reds, and this, plus the reduced vibratory sense in the lower extremities, with absence of free hydrochloric acid in the gastric contents, with lemon tinged skin, seemed sufficient to make probable a diagnosis of pernicious anemia He was so regarded for a period of nearly four years The obstructive signs in the esophagus did not appear until four months before death It must be borne in mind that after the first attack each new attack was ushered in with symptoms of general malaise, indigestion and gastric pain, and the last two attacks with diarrhea We have since learned that a decrease or absence of vibratory sense in older individuals is a fairly common finding and does not necessarily mean posterior column disease

Postmortem revealed no degeneration of any tracts of the spinal cord by Weigert or Marchi stains The anterior horn cells of the cord contained much fat A number of the cells were small and atrophic The vessels of the cord were everywhere considerably thickened There were hyalin changes in vessels of the brain which were surrounded by gitter cells The stomach upon removal showed marked involvement of a malignant nature with metastases to the esophagus An interesting feature of this case was that for a period of five years this patient showed marked anemia, his blood picture closely resembling that of pernicious anemia, but the condition was apparently due to cancer, primary in the stomach, with extension to the esophagus, producing obstruction as a terminal manifestation

Case 3, 21-199, F L , a white male, aged 40, was admitted to the University of Pennsylvania Hospital, service of Dr Spiller, March 15, 1921 His chief complaint was weakness and difficulty in walking He had noted for a period of several months that there was numbness in his feet He had noted that the vibration of the truck he was driving became less and less perceptible to him Weakness was an early symptom, increasing to such a degree that he could not lift weights and could not manipulate the brake and clutch of his truck He began to lose control of his legs, parethesias increased, and later his legs became stiff and he staggered like a drunken man Constipation began and soon he had difficulty in voiding His sex power gradually diminished, pains in his legs became severe and they were very tender to touch His food did not taste as well as formerly There was nothing in his previous history bearing upon his present condition Venereal history was denied The family history was negative

Upon examination he appeared well nourished and mentally he was clear and coherent There was a yellowish discoloration of his skin His pupils were normal The tongue was unaffected The reflexes of the upper limbs were decreased The patellar and achil les reflexes were exaggerated, more so on the right Ankle and patellar clonus were present. Vibration and the sense of muscle position and of joint motion were absent in the lower half of the body, up to the umbilicus Other forms of sensation were normal Babinski sign was present bilaterally He could not stand alone and walked with a spastic and ataxic gait

His first blood examination showed red cell count of 3,770,000, white cell count 7,400, hemoglobin 75% The differential count gave 54 polys, 32 lymphocytes, 5 large monocytes, 2 transitional, 7 eosinophile The urine was essentially negative The blood and spinal fluid Wassermann tests were negative Gastric analysis showed total acidity 6, with absence of free hydrochloric and lactic acids Occult blood was present Examination of the blood April 6, 1921, revealed hemoglobin 80%, red cells 4,110,000, white cells 10,200 The feces were negative He left the hospital unimproved after five weeks He tried a variety of cults until October 14, 1921, when he was admitted to the Philadelphia General Hospital, service of Dr Weisenburg His blood on examination showed hemoglobin 85%, red cell count 4,200,000, white cell count 5,600 A stained smear revealed a very slight change in the size and shape of the cells with no nucleated red cells After one month in the hospital decubitus developed, he became toxic and died December 25, 1921

Blood examination four days before death revealed hemoglobin 80%, 4,470,000 red cells, 10,500, white cells Differential gave 78% polys, 19% lymphocytes, 3% large monocytes A stained smear of the blood revealed a slight variation in the size and shape of the red cells but no nucleated red cells could be found. Roentgenological examination of the spine showed some slight roughening of the articular surfaces of the tenth and eleventh vertebrae. No other lesion was found

Diagnosis in this case was made entirely on the neurological symptoms The blood count even four days before death did not show the characteristic findings of pernicious anemia.

Postmortem examinatoin showed very marked posterior and lateral sclerosis of the anemic type

Comment Clinical diagnosis in this case could be made from the neurologic findings alone. The presence of symptoms indicating a posterior column degeneration, as shown by disturbance in vibration, muscle position and the sense of joint motion, combined with lateral column degeneration shown in this case only by the presence of a Babinski sign, was sufficient for a diagnosis of a posterior lateral sclerosis The most common cause for posterior lateral sclerosis is pernicious anemia.

STILLBIRTHS AND NEONATAL DEATHS IN 1960 CONSECUTIVE PRIVATE CASES*

By JAMES KNIGHT QUIGLEY, M D, F A C S, ROCHESTER, N Y

OBSTETRICAL literature is replete with analyses of stillbirths from public health reports and from hospitals, but the presentation of a similar study of private cases is not common Again, much has been reported of the incidence and causes of stillbirths but less has been written on neonatal deaths and in the consideration of this subject they are inseparable, for many babies are resuscitated only to die in a few minutes or hours from the same causes as those that result in stillbirth, this is particularly true of the groups of birth trauma and asphyxia, the English quite properly combine stillbirth and neonatal death

Sterling in an exhaustive article on this subject in the U S Public Health Reports March 18, 1927, says that from 1916 to 1924 the total infant mortality rates dropped from 101 to 71 per 1,000, or 30 per cent, while the neonatal death rate showed a reduction of only 44 to 39 per 1000, 30 per cent as against 11 per cent During a similar period, 1911 to 1924, in England there was a decrease in the neonatal death rate of 17 5 per cent Our neonatal mortality rate is greater than that of England, and Wales, Australia Ireland, New Zealand, Netherlands, and Uruguay

The following table is of gross infant mortality rates from various localities

A marked lowering of the stillbirth rate for New York State during the past six years can be attributed at least in part, I think, to the work of The Division of Maternity, Infancy and Child Hygiene of the State Health Department The very low rate of 2 5 per cent credited to the midwives of Philadelphia is due to the fact that these were for the most part normal deliveries with probably no operative deliveries and few complications of pregnancy or labor

That there is need for more accurate determination of the cause of death, in other words, autopsies upon these cases rather than reliance upon clinical data alone, is evidenced by a comparison of the causes of stillbirth and neonatal death given from a selected section of the registration area including 18,634 deaths where clinical data was a criterion for diagnosis in a large percentage of the cases, with the causes determined by autopsy in a series of 300 cases of Eardley Holland of England

The differences in these two series is obvious, syphilis and difficult labor including instrumental delivery are of almost minor consideration in the cases not autopsied as compared with the cases checked by post-mortem examination, while the unknown group is comparatively high, 30 per cent, as against 10 per cent in Holland s cases The striking feature of the tabulation in the cases proven by autopsy is the high percentage of stillbirths and deaths due to birth trauma Ehrenfest states "that in at least 40 per cent of all autopsies properly performed on all stillborn infants and those dying within the first few days after birth intracranial traumatic lesions of some sort are discovered" Complications of labor stand at the top of the list as the most frequent cause of stillbirth and neonatal death followed by toxemia of pregnancy and syphilis

TABLE I
INFANT MORTALITY RATES

				TOTAL ‡	STILLBIRTH
Anspach	Private cases	400		2 25%*	
Danforth	Private and Ward	500		3 6	
Beck	Ward cases	1,138		3 0	
Williams, J W	Ward cases	4,000		7 55	
Toronto General Hospital	Ward cases	4,492		8 61	
Sloan Maternity	Ward cases	10,000		7 39	4 29
New York Lying-in Hospital	Ward cases	5,467	1924		4 1
Bellevue Hospital 2nd Division	Ward cases	4,396		6 1	4 8

New York City	State H Rep		1910–1921		4 41
Polak	Ward cases	12,000	"Infant mortality"		2 5
Midwives of Philadelphia quoted from Nicholson		51,693			2 5

*Anspach's series included only cases that had been under his prenatal supervision for at least three weeks prior to delivery and therefore no emergency or consultation cases

‡Total mortality rate meaning the stillbirths plus the neonatal deaths

The Health Organization of the League of Nations briefly summarizes this question as follows "the cause of antenatal fetal death is usually some maternal or placental disease, the fetus is usually macerated The common causes of intranatal

* Read at the Annual Meeting of the Medical Society of the State of New York at Albany May 23 1928

diastolic The heart was normal in size and position and there were no murmurs Blood Wassermann was negative Hemoglobin was 45%, red count 2,050,000, white cells 7,300, differential counts gave normal proportions for lymphocytes Stained smears revealed a marked variation in the size and shape of the red cells and there were many microcytes and macrocytes but no nucleated reds He improved with rest, diet and tonics and was able to walk and get about He was discharged from the hospital April 18, 1923, as a case of probable tabes dorsalis He did well for nearly a year, when he began again to become weak and ataxic and had difficulty in walking He was readmitted to the hospital July 11, 1924 At this time the blood findings were very similar to those of his first admission There was still a slightly low index The hemoglobin was between 40 and 45, red cells slightly over 2,000,000 and white count 7,000 Again there was marked variation in size and shape of the red cells but no nucleated reds and blood and spinal fluid were negative In the spinal fluid there was a trace of globulin, 8 cells per cmm, and a gold curve of 2233220000 The blood sugar was 122 mgm Urea nitrogen 16 mgm Uric acid 2 Unfortunately there is no report of the gastric analysis

Examination at this time revealed marked ataxia of gait, absence of knee and ankle jerks, with no Babinski Vibratory sense was markedly diminished There was moderate disturbance of position and spot localization, and likewise some disturbance of superficial sensation of the legs The arm reflexes were present There was incontinence of urine and loss of libido He gradually failed and died October 15, 1924

Postmortem revealed kyphosis of the dorsal region of the spine Examination of the cord yielded no evidence of pressure or softening at that point Stained sections of the cord later showed marked degeneration of the posterior columns of the cord but no degeneration of the lateral columns There was an increase of fat in the anterior horn cells A latent carcinoma of the cardiac end of the stomach was found

Comment When this case was first studied the clinical picture of tabes was found, which was attributed by the patient to an injury to his back, which occurred shortly before the onset of the condition The marked anemia which was present at the first examination could not be accounted for, since there was no evidence of bleeding anywhere in the body On his readmission the neurological signs had not changed but the blood picture still confused the diagnosis Pernicious anemia was strongly suspected The serological tests on both blood and spinal fluid were negative, even though the gold test was suggestive It is known that in many cases of cerebro-spinal syphilis, especially of tabes, the Wassermann reaction may be completely negative at all times No clinical signs of involvement of the stomach were noted Dr Lloyd felt that the case was one of tabes, plus an unknown condition, probably a malignancy, which would account for the abnormal blood picture His associates were strongly in favor of the diagnosis of pernicious anemia The finding of a carcinoma of the stomach and the microscopic findings of tabes dorsalis in the cord fully explained the symptom complex While a gastric analysis was not reported, it probably would not have added to the differential diagnosis

Summary

We have herein reported five cases in which a diagnosis of pernicious anemia was made or strongly suspected These give an idea of the difficulties attending the diagnosis in cases with complications In our first case the peripheral neuritic picture overshadowed all else. It was only by a complete history and blood examination that pernicious anemia could be diagnosed In the second case, pernicious anemia was considered highly probable but the development of a malignant stricture of the esophagus pointed the way to the correct diagnosis In the third case neurological diagnosis was comparatively easy This man showed all the signs and symptoms from a neurological viewpoint, on which a diagnosis of pernicious anemia can be made, but at no time did the blood give more than the faintest suggestion of this condition The patient died before blood findings developed In the fourth case the mental symptoms so dominated the clinical picture that neurological symptoms were in the background The blood examination, however, gave the clue to the correct diagnosis This case clearly demonstrates the importance of complete examination in all mental cases In the final case, the combination of tabes with a latent carcinoma of the stomach gave a very confusing clinical picture and demonstrates the value of pyramidal tract signs in making a distinction between tabes and postero-lateral sclerosis of the anemic type

CLASSIFICATION OF NEONATAL DEATHS

Hemorrhagic disease of newborn	5
Toxemia	4
Dystocia	3
Congenital pneumococcus septicaemia (twins)	2
Congenital heart anomalies	2
Congenital pneumonia	1
Meningitis, pneumococcus	1
Habitual death newborn	1
Monster	1
Asphyxia	1
Atelectasis	1
Cardiac decompensation in mother	1
	23
Autopsies were done on	16

For sake of comparison a like number of deliveries in the obstetrical ward of The Rochester General Hospital was investigated

Number of babies born	1920
Number of stillbirths	54
Rate of Stillbirths	2 81%

85 per cent of these cases came from the hospital's prenatal clinic

times and in spite of this died Two died on the fourth and eighth days respectively with practically no external bleeding, subdural hemorrhage being a part of a general condition of bleeding, these were unaided easy deliveries The fourth died suddenly on the fourth day of melena, subdural hemorrhage, and a large hemorrhage into the anterior mediastinum The fifth died suddenly on the eighth day from what might have been thought clinically to have been congenital heart disease, but an autopsy showed hemorrhage into the peritoneum and pericardium

Significant features of the combined groups of "Dystocia" are seven of the ten vertex cases were *occiput posterior* and there were three *breech presentations in primiparae* Of the thirteen in this group nine were in their first labor and the four remaining in their second. In two of these multiparae disproportion was responsible for the dystocia, the successful delivery previously of fair sized children through slightly contracted pelves and the inability to accurately prejudge the size of the second children made the choice of version as a method of delivery an error of judgment.

Prematurity was a factor in 18 cases though not solely responsible in more than two or three, it was associated with toxemia chiefly

Toxemias of pregnancy	5 2	10
Malformation (congenital defects)	4 1	5
Syphilis	2 6	16
Traumatism and overwork	3 7	
Other diseases and conditions of mother	3 1	2
Various causes	10 9	
Not specified and unknown	30 2	10

It is customary to divide stillbirths and neonatal deaths into two groups, the preventable and the irreducible unpreventable Anspach estimates that the preventable fetal mortality is about one per cent and that the unpreventable is from one and one half to two per cent

Three groups are susceptible of further reduction First, syphilis, the remedy is obvious, routine Wasserman tests and the thorough treatment of syphilitic cases has proven that healthy children can be born to syphilitic mothers Second, toxemia, intensive prenatal observation of the patient will help, I believe, however, that there is a small percentage of cases, the nephritic toxemic group where in spite of prenatal care placental changes will be inevitable and result in stillbirth before the mother is so ill as to demand interruption of the pregnancy Third, the large group of birth trauma where disproportion, malpresentation, breech and posterior positions of the occiput are largely responsible

F J Browne of Edinburgh who has made an exhaustive survey of this question in Scotland draws the following conclusions 1 Asphyxia was the most common cause of intranatal death and was met in 56 per cent of the total intranatal deaths

"2 Primiparity and breech delivery were the two chief predisposing causes, the latter being twelve times as frequently associated with it as vertex delivery

"3 Its incidence may be diminished by the practice of premature induction of labor ten days before term, especially in primiparae, by external cephalic version in the case of breech presentations, and by careful watching of the fetal heart during the second stage of labor, even when this does not seem to be unduly prolonged"

To all of this I heartily subscribe except to his proposal to induce labor ten days before term in all primiparae It is not easy to determine when this time has arrived, furthermore routine induction even in the hands of its advocates carries with it a fetal mortality of six per cent. It would seem that the best results for both mother and child are not to be had from any routine procedures such as induction of labor, version or forceps delivery but from conservative obstetrics

The determination of the cause of stillbirths and neonatal deaths is very important, too often asphyxia or prematurity is given as a cause when careful examination might have proven that a congenital cardiac defect or an enlarged thymus or some visceral anomaly wholly unsuspected and undiagnosed was the real cause

There are two very good reasons for securing autopsies First, to add to our knowledge in the hope that thereby we may be able to lessen materially the number of these tragedies of childbirth, this particularly concerns the physician. Second, to settle in the minds of the parents the exact cause of death, knowledge is better borne than uncertainty, the cause may have been due to some condition incompatible with life or one where death at birth might be preferable Let me illustrate Baby S born spontaneously after a labor of five hours seemed normal in every way until its fourth day when he developed fever, became listless, of a grayish color with labored respiration. Fluoroscopic examination of the chest showed a widening of the cardiac shadow with a question of enlarged thymic shadow, he died the evening of the fourth day without a diagnosis having been made The autopsy in brief disclosed that the pulmonary artery and the aorta both having their origin in the left ventricle, a much dilated pulmonary artery and a narrowing of the aortic arch

Much has been learned from a careful evaluation of data furnished by autopsies, in this country—Adair with 450 autopsies, McCord with 243, and J W Williams' 212, and in England Eardley Holland has reported 300

The number which are considered in this paper is not large and the author in presenting this series does not claim remarkable results but hopes that some lessons may be learned from this study In the conduct of pregnancy and labor in this series the policy has been one of conservatism, no routine practice of induction of labor, of forceps delivery or of version has been employed but indications have been treated as met, the conservatism practised has been that of close observation, the cases reported are consecutive with no omissions and include not a few first seen when in labor and there are no "corrected" percentages

The first group in the stillbirth classification, cord accidents is relatively high, in the seven cases of coils of umbilical cord about the body, arms, and neck, the cord was tight and more or less collapsed

Under the heading of Hemorrhagic Disease of the Newborn there were five neonatal deaths, an unusually large number today from this cause. One baby had been given human blood several

diphtheria toxin Böhme[12] furthermore showed that pigs, vaccinated according to Jenner's method with living erysipelas germs (Rothlauf), were successfully immunized Neither bacilli nor immune bodies were found in the blood Various authors, such as Moeller[13], Stukowski[14], Jesionek[15], have experimented with tubercle bacilli showing great differences between subcutaneous and intracutaneous application in regards to the toxic effect and overwhelmingly in favor of the intradermal method

Finally I want to refer to Besredka's very interesting book, "Local Immunization," in which he attributes a very special function to the skin in the mechanism of immunity production

The material on which I am reporting consists of 131 cases, divided into three groups

Acute Infections
35 Cases

1st Group—

	Cases
Septic fever	1
Erysipelas	1
Cellulitis	1
Follicular tonsillitis	2
Pelvic inflammation	1
Acute adenitis	4
Sore throats	9
Acute sciatica	7
Neuritis	4
Acute polyarthritis	5

Chronic Inflammation
91 Cases

2nd Group—

	Cases
Simple arthritis	51
Arthritis associated with sciatica	4
Arthritis with bursitis	1
Arthritis with sinus	3
Arthritis with endocarditis	1
Arthritis with synovitis	1
Arthritis with muscular rheumatism	2
Simple sciatica	4
Lumbago	12
Bursitis	4
Muscular rheumatism	4
Adenitis	3
Toxic heart	1

Chronic Suppurative Conditions
5 Cases

3rd Group—

	Cases
Osteomyelitis with recurrent erysipelas	1
Otitis media	2
Sinus and antrum	2

These cases were studied to determine the effect on pain, function, inflammatory signs, both local and general, and the economic capacity

First Group
Acute Infections

In the first group are a number of different diseases grouped together for convenience as they all present symptoms of the same general nature, they are chiefly in first attacks, with the exception of sore throats, which frequently have a history of previous attacks

One erysipelas, two follicular tonsilitis, one septic fever of unknown origin, one female pelvic inflammation, one cellulitis, and four adenitis These were of a type in whom one could expect rather stormy and dangerous symptoms In all a reduction of fever was noted in twenty-four hours which was brought to normal in twenty-four to forty-eight hours with the exception of one, the cellulitis, in which case it was twelve days Constitutional reaction as measured by malaise, strength, general appearance, and earning capacity, was markedly improved at the end of forty-eight hours to three days, and at the end of two days patient was able to resume all activities The case of cellulitis of the arm is especially interesting This was a young man who contracted a rapidly spreading cellulitis of the arm from an abrasion of the hand He became septic with temperature of 106, cold sweats, delirium, and so forth The arm was extensively incised and drainage established In spite of repeated operation, inflammation extended rapidly so that amputation at the shoulder was considered, with, according to the surgeon's experience, but the slightest hope of saving his life After the first vaccination the temperature dropped to 103 in two days, and the whole condition became markedly improved after the second He was considered out of danger after the third vaccination in seven days, by this time the temperature was 100 It was noticed that the process of inflammation stopped after the second vaccination Hemolitic streptococci and staphylococci were found in the pus

The case of septic fever is also of interest Temperatures 99½ to 103 for four weeks No focus obtainable Towards the end of the four weeks purpura hemorrhagia Cultures from the blood were negative, none was made from the hemorrhagic skin lesions All treatment was of no avail After vaccination temperature reduced in 24 hours, becoming normal in ten days Very striking was the quick improvement in the general condition Sleep, appetite, appearance, strength, all improved very rapidly, returning to normal in two weeks

Adenitis I There are four cases, two of less than 48 hours duration, one of three weeks, and one of two years with three acute exacerbations A reduction of the fever was noted in from twenty-four to forty-eight hours, with the exception of one case which, although there was an abrupt fall, took ten days before it became normal The temperature remained stationary after reaching normal While the general condition showed improvement coincident with the reduction of fever, a normal state was obtained in about three days with one exception, which however progressed very satisfactorily

This case is of especial interest. It concerns a boy who in a recurrent attack had been in a

THE TREATMENT OF INFECTIONS BY CUTANEOUS VACCINATIONS

By J G WM GREEFF, M D, NEW YORK, N Y

SOME two and one-half years ago a patient of mine, who had been unsuccessfully treated for a severe sciatica by a number of prominent physicians, walked into my office, cured by a course of vaccinations according to the technic advocated by Ponndorf I was naturally very much interested and began the study of this method, and after working with it for the past two years desire to present the clinical material from my experience with one hundred thirty-one cases, leaving the theoretical problems for subsequent discussion This treatment of infection consists of the application of vaccines by the intracutaneous route Ponndorf uses two types of vaccine *A*, which is pure Tuberculin, and *B*, consisting of a bacterial autolysate of microorganisms, viz, streptococci, groups of pneumonococci, staphylococci, micrococci, and influenza bacilli, plus a certain amount of albumen, fat, lipoid, and soluble material obtained from the tubercle bacilli My experience is with the Vaccine B Up to the present time I have treated acute and chronic cases, whether of known etiology or not, with variable results, but in the main so satisfactory that I wish to make a preliminary report The intracutaneous route is the introduction of vaccine strictly into the true skin and not into the subcutaneous fat The skin is cleansed with water only, though ether may be used if the skin is very oily Then the skin is incised down to the papillary layer, making from twenty to thirty linear incisions covering an area of from six to seven by nine centimeters, and the vaccine is applied to this In incising one must avoid bleeding and cut just deep enough to show at most a slight oozing Duration of treatment and number of vaccinations given varies with the type of case, also whether acute or chronic From eight to ten treatments are generally required in chronic cases while three to four in acute are usually sufficient The interval in acute cases is four days, and in chronic cases three to four weeks The amount of vaccine remains the same for each vaccination, but should a greater reaction be required, we obtain this by enlarging the vaccination field A positive reaction is indicated by a local inflammation of the skin, and one may get constitutional reactions such as malaise, fever, chills, headache These last about twenty-four hours The degree of local reaction is often indicative of the improvement which may be expected, in that vesicular or pustular dermatitis at the site of vaccination promises a greater likelihood of success than do the milder reactions of simple papular reaction with or without an area of redness around the vaccination site Very mild reactions or none at all may be due to the fact that the patient is greatly run down or anemic In these cases we may not get any result until the patient's general condition is improved.

The Ponndorf method is in reality a rediscovery of a principle presented by Jenner in his smallpox vaccination With the exception of Petrushky[1], who drew attention to the action of tuberculin salve on the unscarified skin, no scientific effort was made to use the skin until Ponndorf[2] started his work in 1908 for the treatment of disease by vaccines used intracutaneously It seems odd that so many years had to elapse since Jenner's time before any one thought of making use of an organ which apparently must be considered one of the important immune biological agents of the body Dating back into antiquity we find evidence that the Chinese, a thousand years ago, put specific crusts into skin lesions or the nose to protect against smallpox Primitive people used the same principle, utilizing the skin as a medium for immunizing animals against peripneumonia A spear plunged into the lungs of an infected animal was used to apply this material, thus obtained, to the skin of an animal they wished to protect against peripneumonia

The study of the mechanism set at work in the skin is of great interest So far the knowledge, let us say the assumption, that the skin is an organ with a special function is based more on clinical experimental work than on laboratory work

It is beyond the scope of this paper to go deeply into all the evidence we have tending to prove a special function, but I would like to allude to just a few examples which bear consideration These are, first of all, immunity derived by Jenner from vaccination Next we have Capesser's[3] soap inunction therapy in tuberculosis of the peritoneum, mustard counterirritation and painting of the chest wall with tincture of iodine in pleurisy, Robert Koch's[4] fundamental experiment in tuberculosis vaccination, Von Pirquet's[5] and other investigations on vaccination allergy with TBC, immunity following diseases with marked skin manifestations, Erich Hoffman's[6] work with the short active rays of artificial sunlight, which we know do not penetrate deeply and yet effect beneficial results on the general health and exert an influence on remote foci, Bohme's[7] interesting experiments with live Klebs-Loeffler bacilli applied intradermally, producing an immunity against diphtheria and showing that the bacteria are killed in from four to five hours, results substantiated by Schlossmann[8], Muller and Meyer[9], and Bayer[10] Bogendörfer[11] showed experimentally that diphtheria toxin in vitro was neutralized or attenuated when brought in contact with macerated skin of man whose organism contained antibodies against

was obtained in local symptoms, both arthritis and sinus, while in one of these cases the sinus was never relieved entirely but the arthritis pains disappeared and the sinus symptoms greatly diminished In the other case the sinus was entirely relieved while the arthritis condition was reduced in one month, and was practically eliminated in the course of three months The case of arthritis with an involvement of the endocardium showed a reduction of pain after ten days Six months later was reported as being worse. I have since heard that some further improvement was noted

Associated with Bursitis VIII One case In this case the arthritis condition was brought back to a normal state of health within four months while no change was noted in the bursa

Associated with Sciatica IX Four cases All with over a year's duration Previous treatment consisted of vaccine injections, eradication of foci, and physiotherapy Improvement of pain and tenderness and function was noted in from five days to nine weeks in all Only one was relieved entirely of both arthritis and sciatic local symptoms Three showed general constitutional improvement, and two of these became normal in from two to three months One was never changed constitutionally

Associated with Muscular Rheumatism X Two cases of two to fifteen years standing In both of these cases a reduction of pain and discomfort was noticed alike in the muscles and joints in from one to two months, and the same applies to the constitutional effect, as shown by increased capacity and strength, and ability to work

Simple Sciatica XI Four cases of sciatica of from five months to seven years standing In all of them we had reduction of the pain in from three days to three months, three months in a case of seven years' standing, while only ten days in a case of three years' duration Two of these cases were entirely relieved of their pains and brought back to normal capacity in from one and one-half to two months, while two cases were never relieved of their pains nor were they brought back to full capacity although a follow-up of sixteen months records that a greater improvement was noted since the vaccinations

Lumbago XII Twelve cases of lumbago of varying durations, lasting from three months to a number of years Various forms of treatment such as physiotherapy, medicines, removal of foci were without avail A reduction of pain and stiffness was noted in all In a few cases this occurred in from seven to ten days, in more, in a month, and in none of them was the time for this reduction in their local signs longer than thirty-eight days Seven of these twelve cases lost all pain and discomfort, and five were not brought to a normal state Constitutional condition, that is, full strength and capacity to resume their normal occupation, was improved in all but two cases, and brought to normal in four This was accomplished in from three to ten vaccinations over a period of from one to nineteen months, or an average of eight months In one instance, a case of several years' duration which never had any treatment, improved as regards pain, but never regained a full constitutional status A year's follow-up showed no recurrences of pain The average follow-up of all was six months

Chronic Bursitis XIII There were four cases of chronic bursitis with a duration of from seven months to a number of years In one there was no change at all Of the other three improvement as to pain was noted in from ten days to two months, two only becoming normal in this respect All these three were considered normal regarding their function and capacity, one after four weeks, one seven weeks, one four months

Muscular Rheumatism XIV Four cases of from four months to two years' duration In all there was a reduction of their local signs, pain, stiffness, in from eight to ten days, but were not brought to normal Three improved as to capacity, and one remained unimproved One case was brought to normal capacity though the local signs never became normal The patient reported practically no symptoms a year later In two of these cases, associated with arthritis, both showed a reduction in the local signs and constitutional improvement, but no complete restitution

Chronic Adenitis XV Three cases of two months to two years' duration In two the pains and swelling of the glands was reduced in ten days, in one one month Constitutionally improvement was noted in ten days in two, one month in one Complete return to normal occurred in two cases, one in ten days, and the other in thirty-seven days The third case never returned to normalcy This case was one of only two months' standing and received but three vaccinations, while the other two had received six each

Toxic Heart XVI In this same group of chronic inflammations was a case of toxic heart It concerns a boy of fourteen who was ill in bed for three months with temperatures ranging between 99 and 102, with severe infection of the nasopharynx and tonsils and involvement of the cervical glands For a period of six months his heart was under observation He had a pulse of 120, and electrocardiograms revealed auricular premature beat and sinus arhythmia After one month with three vaccinations his pulse was reduced to 80 and remained there He showed constitutional improvement as measured by malaise, disposition after eight days, and was considered able to resume all activity in fifty days A check-up of two years shows him to be in splendid physical condition, with no complaints about the heart He has grown and developed wonder-

desperate state with uninterrupted fever for five weeks In spite of the best care, with all advantages at hand in the way of advice, general care, and various treatments, he did not improve After the first vaccination, a change in temperature, pulse, and tenderness was noted, and after the second his temperature reached normal From this time on he has been in a continuous state of improvement, and although after one and one-half years he had not regained his entire health, he was back at school, is able to play all games with but slight supervision Three years after the first vaccination he developed a sore throat, enough to prostrate him for three days, no rash. His sister came down with a well-defined scarlet fever one week later The boy's whole condition was cleared up by a further vaccination.

Acute Sciatica II Seven cases, with a duration of from five days to two months Previous treatment was rest in bed, local applications, medicines, heat, massage, general hydrotherapy After vaccination one case which showed fever ranging from 99 to 102, had it reduced and brought to normal in twenty-four hours Pain and tenderness were reduced in eight hours in one case, in four cases in from three to ten days, and in two, within five weeks Complete absence of pain and discomfort was obtained in six, while one did not become normal Improvement as to capacity was noted in six cases within ten days, and were brought to normal within five weeks One case remained unimproved The follow up is from two to fourteen months

Neuritis III Four cases One of ten days duration, two of two years, and one of long but not definitely stated time Vaccines, physiotherapy, removal of foci had been done, and in one laminectomy Improvement as to pain was noted in three, one of which became normal in ten days Constitutionally, two were improved, one became normal, one worse, and two were unimproved

Acute Arthritis—Acute Articular Rheumatism V Five cases of from one day to seven weeks duration Two had their fever reduced in from twenty-four hours to two days two in one week, and one in four weeks In this latter case the temperature became normal in two months In three, temperature was normal in from two to ten days In one the temperature did not go to normal during three months' treatment in spite of five vaccinations This one never showed any improvement while all the other cases recovered their full capacity in from one to three months A follow-up of from eleven to twenty-one months showed no return of arthritis symptoms

Sore Throats * V The duration in the cases treated was from one to two days to a year Two of them were apparently in their first attack, while the others had frequently recurring attacks, often without fever, in the course of a year In the cases presenting fever, a reduction was noted in from twenty-four hours to two days The local signs were reduced about equally as soon in the first febrile attacks as they were in those that presented themselves with recurrent attacks with or without fever, that is, in from forty-eight hours to six days, with the exception of one case of one year's duration, which showed an increase after vaccination Constitutionally three cases took from ten to twelve days to show any improvement, two showed improvement in twenty-four hours, two in three days, one in four Of the patients with recurrent attacks, two considered themselves normal in four days, and with a follow-up of from two to four months showed no recurrence One after a year remained normal, two, which became normal in from ten days to two weeks, did not have recurrence in six, and twenty-two months, respectively One seen in an acute attack, which became normal in fourteen days, remained so for twenty months

SECOND GROUP

Chronic Arthritis VI Fifty-one cases of polyarthritis had a varying duration of anywhere from one to forty years All of them had received treatment, such as tonics, climatic changes, physiotherapy, and medicines Foci, where found, were removed, vaccines of various kinds were used without results In all but seven there was a reduction in their local signs, in one instance as soon as five days, in a large number of cases in anywhere from ten days to two weeks, in some only after three or four months after beginning treatment, in one case after nine months The majority had a follow-up of from two to fifteen months In nine, no follow-up could be obtained Nine were not improved as to their capacity and general well-being, the others, 42, all showed improvement in from two to four months The largest number of vaccinations given was twelve, and the least number two Some cases are still under treatment, some showed short relapses, after which they resumed a satisfactory progress towards improvement It will be noted that twenty-four of these cases which did not attain a normal state of health as measured by capacity and general well-being, nevertheless were improved in respect to pain and discomfort

Arthritis With Associated Conditions VII There were two cases of sinus with arthritis, one case of synovitis in one joint with arthritis, and one case of endocarditis and arthritis

Of the two cases of arthritis and sinus, relief

* By sore throat is meant a condition which is difficult to define as an entity There is no definite pharyngitis nor tonsilitis In many cases as a matter of fact tonsils have been removed yet these patients suffer with definite symptoms, recurring from time to time such as malaise temperature, pain a feeling of fullness and often actual swelling, cervical or submaxillary glands are frequently swollen Gargles, hot douches local applications are of little avail A simple term describing what we wish to convey would be infected throats

MAL-PRACTICE DEFENSE

Defense against malpractice suits is one of the major benefits of membership in the Medical Society of the State of New York No doctor is exempt from the chance that a lawsuit will be brought against him, and doctors of financial means are especially attractive marks for designing ambulance chasers

The article on page 347 sets forth the principles on which the Medical Society of the State of New York defends its members, who arm themselves with lawsuits It would seem that the principles are broad enough to cover every condition in which a careful physician is likely to become involved

fully in every respect, and is able to do sports of the most strenuous type

Third Group

Chronic Suppurative Conditions XVII There are five cases of chronic suppurative condition in the third group, one a case of osteomyelitis with recurrent erysipelas, and two of otitis media, and two with sinus and antrum inflammation

Two cases of otitis media were of six and two years' duration in whom frequent paracentesis had been resorted to The one with two years standing was one which had frequently recurring attacks, and came during an interval for vaccinations Since vaccination there has been no recurrence nor did the patient have any colds in the following sixteen months In the other case the discharge and discomfort was reduced in ten days, became normal in forty-four, while general constitutional improvement was noted and brought to normal within ten days A follow-up of a year shows no recurrence, and the mother reports him 100 per cent improved

The antrum and frontal sinus cases of from several to five years' standing showed a reduction of their pains in ten days, with one case becoming normal in two months, the other never quite normal Both cases showed constitutional improvement within ten days though never becoming entirely normal The follow-up of from three to nineteen months reveals the fact that though several colds have occurred the sinus has never given any more pain, and in the other case during nineteen months' observation only slight colds were noticed without a flare-up in the antrum

Chronic Suppurative Condition with Recurrent Erysipelas This is a case of considerable interest It concerns a man of thirty-six years of age, who, at the age of sixteen, injured his toe following which a septic inflammation set in, with an osteomyelitis in the lower third of his tibia In the course of eight years numerous operations were resorted to to remove sequestra as they occurred Finally the wound healed but again opened with a fresh sequestrum four years later Since then the patient has been troubled with suppurating fistuli, one a very large one showing the bone and three smaller ones, all suppurating extensively Lues and tuberculosis were excluded The patient received almost every known treatment in the form of *x*-ray, Alpine light, dressings, and general tonic treatment In the past six years patient developed two to five weeks' attacks of erysipelas confined to the leg, but of very violent character, temperature going to 103 and 105, attacks lasting from three or four days to two weeks These would occur chiefly with the closure of one or the other of the fistuli The patient presented himself with this status for treatment by vaccinations He received in all four treatments, and from the time of the first reported progressive improvement, closing of the fistuli, and healthy granulations with diminishing discharge In six months he hasn't had a recurrence of erysipelas, and feels better in every way than he has during the past six years

Conclusions

The intracutaneous administration of stock vaccines composed of an autolysate of various microorganisms—streptococci, groups of pneumonococci, staphylococci, micrococci, and influenza bacilli, plus a certain amount of albumen, fat, lipoid, and soluble material obtained from the tubercle bacilli—has in a series of thirty-five acute cases and ninety-six chronic cases produced in most a definite beneficial effect.

In acute infections the lowering of temperature and subsiding of the local signs of inflammation after one or two vaccinations has been striking

In chronic cases (arthritis, lumbago, neuritis) the results have been definite although less striking Conditions treated by all of the established methods without success have experienced relief of pain, diminution of swelling, and partial or complete return of function in all but nine cases Where a bacterial cause has been definitely established or presumed, results have been more definite In cases with non-demonstrable bacterial origin, results have been less obvious, in these cases improvement of general condition and relief of pain has been more striking than the return of function

MONOTONY OF CULT LEGISLATION

This is the open season for medical legislation, and for a repetition of the specious arguments whose dull monotony seems original to every crop of inexperienced legislators Cult legislation goes back at least one hundred years to the time when a medical practice act was passed in New York State, but with the disabling exception that anyone could prescribe herbs which are native to New York State Since that time there has been an endless reiteration of demands for exemptions from the provisions of medical practice laws

The reasons put forth by the cultists for special exemptions are extremely monotonous in their annual repetitions of arguments at least a quarter century old, as will be seen by the following list

1 Public benefit—the cultist exemptions are in response to a popular demand as shown by the number of persons who appear at hearings in support of cultists

2 The selfishness of physicians in contrast to the generosity of cultists in giving the people what they want

3 The inalienable right of American people to secure the kind of medical treatment that they may choose

4 Always the exemption of present healers, regardless of their skill and qualifications "Exempt us and we will put the qualifications so high that no one else can enter the fold to compete with us in our restricted monopoly"

These arguments are but the labels of conventionalized arguments which sound as though they were fixed on phonograph records ten years ago, and are played to legislators in endless repetition every returning convocation of legislative assemblies

---

THIS JOURNAL TWENTY-FIVE YEARS AGO

Malpractice Defense—The first article in the NEW YORK STATE JOURNAL OF MEDICINE for March, 1904, is an historical editorial entitled 'Associated Medical Defense." After referring to a revised charter granted by the Legislature to the New York State Medical Association in 1900, the editorial says, 'Owing to the novelty of the idea that a medical organization could be of practical value and use to its members, other than in a scientific way, the proposed plan for associated defense of members from suits for alleged malpractice was for a time postponed The plan was finally adopted, and, as is well known, became effective last March That it filled a long-felt want was shown by the fact that its announcement was responded to by the immediate application of between four and five hundred physicians for membership

"When the matter of associated defense was first under consideration, it was thought that probably the best way to accomplish it would be by making a contract with an insurance company of standing to furnish the necessary legal services to members for a definite yearly payment by the Association, but this proved impracticable on account of the premium demanded by the companies, and therefore it seemed best for the Association to employ its own attorney, at an annual salary, not only to attend to this work, but to look after the enforcement of the medical laws of the State as well This plan also offered the advantage of confining professional family secrets to executive meetings, thus saving its members the unpleasantness of stating their differences with their patients to lay strangers, who naturally would give them little courtesy and scant sympathy by reason of not fully understanding the situation

"Statistics show that in the United States an average of one physician in every 150 is sued each year for alleged malpractice The experience of The New York State Medical Association at first confirmed these figures, but when it became publicly known that the Association had assumed the defense of its members, this average rapidly fell off, and the great majority of the suits brought against members were discontinued as soon as it was learned by the plaintiff that the Association had undertaken the defense

"The effect of this wise action on the part of the Association in defending its members against attacks upon their professional honor and standing has not only been of direct benefit to the members of the Association, but to all members of the medical profession of the State and country as well, as shown by the adoption of similar plans for the protection of their members by other representative medical organizations"

DISCUSSIONS

A discussion is usually considered to be a necessary part of a medical society meeting A program is introduced by a leader who may be a lecturer, a clinical teacher, or the sponsor of a new medical movement Then comes the discussion, when anyone can take the floor to ask questions, or add new points, or to take exception to those made by the speaker The discussers will include the "Me, too" man who agrees with the listener and then simply repeats his points There is also the chronic objector who calls attention to insignificant "points which the speaker has failed to mention"

These consumers of time are always with us, and will remain so long as discussions are considered to be necessary in order to "arouse interest in the society proceedings"

Program makers often list discussions with the deliberate design of giving certain members the opportunity to hear their own voices, on the theory of the preacher who said,—"The best prayer meeting is that one in which *you* take part"

Discussions are usually necessary on the program of a medical society, how important they are will appear in an analysis of their characteristics They consist of three elements

1 Facts
2 Deductions
3 Opinions

There are men who possess knowledge of facts with a power of thoughtful expression in a happy combination that delights an audience no matter how often they rise to speak, but these men are also good listeners, always grasping the thought of the lecturer Then, too, there are men who come to learn, and who prepare themselves before the meeting so that they ask questions intelligently and thus compliment the speaker These questions secure the approbation of both the lecturer and the audience One who is listed to discuss a paper is often at the mercy of the lecturer Did you every try hard to listen to a speaker and were unable to determine what he was driving at? Only an expert could make the discussion of such a paper interesting

If only those possessing knowledge of a subject were to discuss a paper, the lecturer would feel that he had made a failure, for the acid test of his success is the degree which his lecture has been understood by those who are in most need of instruction and inspiration Intelligent questions from interested listeners are the greatest compliment that an audience can pay a speaker

Doctors are accustomed to make deductions and to draw conclusions As Dr Samuel Lambert says "A diagnosis is a working hypothesis for the application of therapeutics, and is subject to change on discovery of further evidence" One who hears a paper forms a working hypothesis whose application may be different from that intended by the speaker It may be that the wrong diagnosis is the result of incomplete evidence presented by the speaker, but it is more likely to be the result of faulty comprehension by the listener Every lecturer values the point of view of his audience, and only from those who discuss the paper can he see his own thought as it is reflected back from the discusser

Much that is said in a discussion consists of deductions in distinction from facts Both the lecturer and the audience will welcome deductions made by thoughtful listeners, but always a distinction is to be made between the deductions of the listeners and the facts on which they are based

Then, too, there are discussions consisting of opinions which are based on neither facts nor deductions The audience recognizes the opinion of the speaker, even though the chairman of the meeting is compelled to treat him with a courtesy which may be interpreted as a compliment

Discussers are of two types,—the talker and the thinker One of the talking type is not a listener, but he exercises his brain in scheming what he shall say after the lecturer finishes, and all through the lecture he pours out ideas rather than absorbs those of the speaker No lecturer can make an impression on one who is devising a reply

The thinker, on the other hand, puts aside his own opinions and tries to grasp the thought of the lecturer, and when he is asked to speak, he often begins slowly and uncertainly, but as he amplifies the lecturer's points he becomes eloquent Good listening is essential to a good discussion

A discusser may be either a reporter or a propagandist The reporter forms deductions and conclusions, while the propagandist refuses to accept the evidence but continues in his own preformed opinions A medical audience is bored by the propagandist

A discussion may be either informative or controversial Medical audiences are impatient with speakers of the controversial type

To what does this editorial lead? It is an outline of the opinions involved in making a diagnosis of a discussion in an average medical society If Dr Lambert's definition of a diagnosis is applied this editorial is a list of facts to be ascertained by the observation of those who take part in a medical society meeting These facts are the basis for making a diagnosis of the elements of success or failure of a speaker, and of forming a working hypothesis on which discussers may base their method of speaking If the speakers diagnose the conditions correctly, they will apply the proper treatment to the subject with satisfaction to the lecturer, the audience and themselves

of the general practitioner to promote all such movements, because the public look to him for leadership One specific responsibility to which the writer refers is in regard to tuberculosis The practitioner should be more careful to make an early diagnosis, to report cases of this disease, and to instruct the patients and their families in respect to the means of preventing spread of the infection, emphasizing the point that heavy infections in childhood are particularly dangerous Another responsibility concerns the solution of the problems of maternal and infant hygiene The family physician can do more than anyone else to persuade mothers of the need and value of antenatal care He should insist upon this care or refuse to take the case The general practitioner should give a start to, and then support the securing of, an adequate nursing service for the care of confinement cases in his community He should be careful in examining food-handlers when called upon to sign a certificate stating that they are free from any communicable disease, including tuberculosis and syphilis He should endeavor to further the application of preventive measures against smallpox and diphtheria It is not intimated that practitioners oppose such measures, but it is suggested that they fail to present to the individual parent the reasons why his children should receive this protection The future of the periodic health examination rests with the general practitioner The family physician should be the logical one to perform this service The general public are demanding these examinations and are not going to be contented with any half-hearted examination and jocular advice.

XIX Century Medicine and Present Day Criticism—Paul Diepgen discusses this subject from angles old and new The time may now be ripe, he says, for a revision of our conceptions of the revolutionary advances of the XIX century The inception of these may be ascribed by the future historian to the influence of Napoleon who broke down so many of the precedents of the day Not only was science but pseudo-science stimulated, and side by side with actual progress we saw the development of various therapeutic schisms and phrenology Later in the century colonization of the tropics broadened our knowledge of disease in more ways than one, the chief being the necessity of sanitation among oversea troops, marines, etc The Red Cross was in a sense an outgrowth of the preceding and a step in the development of world medicine. Social medicine and public health had their origin in the middle of the century as a question of domestic politics In a sense this could have originated either in an aristocracy of the paternal type or as a natural expression of democracy Another development of the idea of democracy was the admission of women as practitioners A philosophy of medicine was awakened midway in the century by thinkers like Comte and Mill, whose advocacy of observation and experiment and exclusion of a subjective and metaphysical influence stimulated some of the great medical scientists to research, this movement was furthered by the works of Darwin, Spencer, and others. There were, however, numerous reactionaries against purely materialistic conceptions and the late developments of the century tended to exalt energy at the expense of matter Psychotherapy and psychoanalysis are purely products of the XIX century and are also opposed to the purely materialistic view, standing in association with hypnotism and spiritism in this respect But perhaps the greatest influence in XIX century medicine was the rapid advance in the exact sciences of physics, chemistry, and biology and the aid supplied by them to laboratory workers —*Deutsche medizinische Wochenschrift*, December 28, 1928

The Causal Organism of Yellow Fever—That so acute and experienced a bacteriologist as the late Noguchi should have been mistaken as to the cause of yellow fever is a fact not easily explained W H Hoffman and F Jahnel have made researches on the cadaver of a victim of African yellow fever in an attempt to clear up this mystery As far back as 1920 Hoffmann identified Noguchi's American yellow fever spirochete with the spirochetic cause of epidemic jaundice, which at least it strongly resembled Much subsequent research by Noguchi, however, seemed to make out a complete case for his discovery and the latter held the stage until the recent outbreak of African yellow fever—in other words for ten years Explanation is most difficult Could Noguchi's patient's have been victim's of Weil's disease, so called, and not of yellow fever? Could the experiment animals on which the doctrine was built up have suffered from latent parasitism? The viscera from the African victims have been subjected to a most exhaustive study by Hoffman since 1926 and although the pathological finds were unmistakable he has not found a single spirochete, neither Noguchi's lepospira nor the organism of Weil's disease No organisms of any kind could be detected Noguchi may perhaps have been influenced slightly by the alleged discovery of Stimson in 1907 of a spirochete in the kidney of a yellow fever patient, but all subsequent study of the kidneys has failed to detect this organism, termed by Stimson *Spirochæta interrogans*, from its resemblance to an interrogation point. Weil's disease has at times been confounded

MEDICAL PROGRESS

The Scope of Physical Therapy—Dr William Benham Snow states that the indications for physical therapy comprise a very wide field, including various types of inflammation—those arising from infection, those arising from trauma, and those resulting from restrained or disordered metabolism The low volt constant current, though filling a smaller rôle than it formerly did, cannot be replaced for electrolysis and for destroying or altering tissue conditions locally The static modalities occupy an important place therapeutically for the removal of accumulated infiltrations or exudations occurring in the forms of arthritis, neuritis, and in congestions of the various viscera For the restoration of normal general metabolism and the awakening of sluggish activities of the various organs of the body the static modalities are more effective than other measures The high frequency modalities carry warmth and increased nutrition to every part of the body The induction of local hyperemia with diathermy controls conditions associated with infection by provoking increased activity of the phagocytes and brings an increased number of nature's germ destroyers into the field where germs are present The employment of the high frequency current for electromedical surgery is a field of wonderful possibilities Radiant light and heat, penetrating as they do to considerable depth, induce local hyperemia which facilitates the destruction of bacteria in regional fields, as in the treatment of otitis media and sinusitis The ultraviolet rays produce changes in the blood constituents and other changes in remote parts of the body, acting in a manner as vitamins do in effecting the conquest of various superficial infections, and producing a reaction from severe surface exposures, as in herpes zoster and neuritis The *x*-rays and radium are useful in the treatment of all tuberculous infections, as well as in tuberculous adenitis and peritonitis Hydrotherapy and thermotherapy are useful for stimulating circulation in the periphery, and for their reflex action on the deeper centers of the body Hot air generated by a special apparatus is particularly useful in awakening the deep reflexes of the cardiovascular system, and also for the treatment of local and general septic infection Mechanical vibration and massage increase the local blood supply, and so improve the nutrition of parts atrophied or having lowered conditions of circulation, they are particularly useful where exercise cannot be employed, as in certain cardiovascular conditions—*Physical Therapy*, January, 1929, xlvii, 1

Modern Drug Remedies—Professor F Eichholtz sums these up briefly under the following heads functional remedies, principally the hormones—adrenalin, thyroxin, insulin and the two hormones of the pituitary, symptomatic remedies, such as hypnotics, anesthetics, antipyretics, stimulants, etc, are placed in a separate category, their action often being variable, so that we use them more or less empirically New methods of physiological testing show that we have not understood their action, for while aspirin is merely ranked as an "antipyretic," as if it acted on the heat center, its principal activity is exerted on the peripheral blood stream Amidopyrin, another alleged antipyretic, has been shown to be a spasmolytic of the papaverin type and its control of pain is due in some way to relaxation of peripheral spasms of some kind Hence these new methods of measuring activity represent a great advance in showing how some of our old favorites really act In this symptomatic group the author also places liver extract for anemia, its action being still obscure. The remainder of the article is devoted to chemotherapy, including the organic arsenicals, preparations of bismuth and antimony, various quinine derivatives, certain mercurial combinations, chaulmoogra oil (for leprosy), tryparsamide for trypanosome diseases, emetine and various drugs—especially carbon tetrachloride—for intestinal nosoparasites and naturally serum therapy in so far as it represents a chemical antidoting, although the author merely mentions it in passing, which neglect also is noted regarding the new remedies for rickets He sums up by stating that the advances in drug treatment for the past 15 years exceed those of any previous period, for within that interval many thousands of cases of pernicious anemia, diabetes, rickets, leprosy, and numerous tropical maladies have benefited to such a degree that these ailments have lost much of their terrors—*Deutsche medizinische Wochenschrift*, January 11, 1929

Responsibilities and Opportunities of the Private Practitioner in Preventive Medicine—A Grant Fleming, writing in the *Canadian Medical Association Journal*, January, 1929, xx, 1, directs the attention of the individual practitioner to his obligation to humanity to bring about the application and practice of the known means to prevent disease and to promote the public health It is the peculiar responsibility

tinguishable by the electrocardiogram Left ventricular preponderance was most frequent (17 cases) and premature contractions ranked second in frequency (12 cases) Electrocardiographic evidence is of extreme importance not only as affording a clear-cut demonstration of focal lesions, but as a method of precision by which the progress of the disability can be estimated. In early cases treatment should be directed to elimination, the adequate adjustment of rest and exercise, and the avoidance of all excesses, especially over-eating, intemperance in alcohol and tobacco, and prolonged physical and mental stress Apart from the usual emergency remedies, certain cases respond best to sodium iodide in large and increasing dosage (10 to 40 grains, three times daily) To obviate the depressing effects of certain drugs when administered over long periods, it is wise to alternate with occasional courses (perhaps one week in four) of some reliable general tonic, such as Fowler's solution, combined with strychnine or nux vomica and perhaps iron Digitalis, except in complicating auricular fibrillation, auricular flutter, and dilatation, has no useful application in myocardial degeneration In certain cases reliable diuretics (diuretin, theocine sodium acetate, urea, etc) may become necessary, and, if these fail, novasurol —*The Lancet*, December 29, 1928, ccxv, 5496

The Nosebleed of the Arteriosclerotic —E Bergmann points out that in the arteriosclerotic subject nosebleed mostly supervenes without apparent external cause and is usually profuse A bloodvessel gives way under the increased intravascular tension and may be said to represent a spontaneous phlebotomy The advice to the practitioner is to let nature take its course and await the cessation of the hemorrhage If the patient himself have insight into the nature of his trouble it is best not to call a doctor for the latter may feel compelled to make a showing and apply hemostasis Naturally the loss of blood may be dangerous or, what is about the same, may frighten the patient and then it will be necessary to interfere The first-aid forward tamponade seems at first to have conquered the condition, but the patient is probably swallowing the blood and moreover the tampons become saturated In regard to the posterior tamponade, so frequently advocated in textbooks, it is really without theoretical justification and is also a source of great danger, according to those who have really given much time to its study All of the structures which make up the face and appendages are greatly swollen, the patient suffers in various ways from the forced mouth breathing, and the subjective sensations are highly disagreeable The rational method of procedure is to inspect the membrane and locate the leaking vessels which are almost always seated forward, after which one applies some hemostatic in situ The author has found that two measures suffice—mechanical compression and the use of silver nitrate in some form which will secure coagulation —*Munchener medizinische Wochenschrift*, December 28, 1928

Is Malignant Hypertension a Disease Entity?—J B McElroy thinks that the term essential hypertension may still be retained to designate cases of this condition without evidence of kidney involvement. There is a large group of cases of hypertension associated with arteriosclerotic kidney (a hyaline and fatty degeneration of the vessels the size of the vasa efferentia and interlobular arterioles) In these cases vessels of corresponding size of the spleen, pancreas, and brain may be similarly affected, but it is not a generalized disease This is the strongest evidence against the view of the primary functional hypertension as the only cause of the cases in this group Clinical and anatomical experience will not permit the writer to accept the view that malignant hypertension is only the renal form of the arteriosclerotic kidney Though essential hypertension, the beginning and end stage of the arteriosclerotic kidney, and the beginning stage of malignant hypertension may all present very similar clinical pictures, a careful study will differentiate them Arteriosclerotic kidney usually occurs in patients after the fiftieth year of age Evidence of slight renal involvement is present. Malignant hypertension occurs at a much earlier age than arteriosclerotic kidney —usually from the fortieth to the fiftieth year This fact is not easily reconciled with the view that malignant hypertension is the end stage of the arteriosclerotically contracted kidney Syphilis, lead, gout, and well known vascular poisons, play a distinct rôle in the causation of malignant hypertension In the early stage when kidney insufficiency is not pronounced, it may be diagnosed by hypersensitiveness to added salt and by inability to excrete added urea Later, when marked kidney insufficiency develops, the end-stage of malignant hypertension has to be differentiated from the end-stage of chronic glomerular nephritis There are toxic injuries in both conditions, but in glomerular nephritis the toxin produces primarily a capillaritis and affects the arterioles secondarily, in malignant hypertension there is the reverse of this order, as demonstrated by the microscopial picture. The conclusion cannot, therefore, be avoided that malignant hypertension is a disease entity dependent upon definite and distinct pathological conditions —*Southern Medical Journal*, January, 1929, xxii, 1

with yellow fever in the clinic and until disproved we must bear in mind this possibility of confusion. The authors do not mention what if any first hand experience Noguchi had had with Weil's disease and the *Spirochaeta icterohaemorrhagica* assigned as its cause and this omission seems to be of vital significance in this connection.—*Münchener medizinische Wochenschrift* December 14 1928.

Tuberculosis Reinfection of the Lungs.—Professor L. Aschoff reaches the following conclusions after a first hand study of the subject. He refers solely to extrapulmonary reinfection, whether this proceed from some other portion of the patient's anatomy or by the aerial route. If the patient reinfects himself the bacillus reaches the lung by the hematogenous or lymphatic route. If we study the lesion of an isolated reinfection this will be found to consist of an exudative and productive irritation-focus—so-called entry infiltration—which as a rule will undergo an extensive absorption of collateral exudate leaving cicatricial tissue which may be pleural subpleural intrapulmonary etc. Statistics of all pathologists show us that these lesions tend very strongly to heal themselves with scars which are specific for tuberculosis and contrast with the primary focus or foci. In the autopsy room primary lesions and scars are found in about the same frequency. Reinfection occurs both in childhood and in adult life and attempts to form two groups on this basis have been futile. We know only that reinfection is rare before puberty and that calcareous residues are especially rare. The majority of reinfections are localized in the respiratory area of the apical bronchus and the more caudally the others are situated the rarer the incidence although the size of the focus should increase caudally. Practically this distinction does not seem of much value for in every clinical form of tuberculosis both old and new lesions may occur side by side nor is any information forthcoming as to whether we have to do with an autoinfection or a heteroinfection. But the fact that these foci of superinfection have a general tendency to heal is reassuring even though in the exceptional case they may lead to the generalization of the process in the lungs. The author is silent as to the behavior of the primary focus in the presence of reinfection.—*Klinische Wochenschrift* January 1 1929.

Clinical Significance of Questionable Diphtheria Bacilli.—K. R. Grebe essays extensively of his experience with atypical and false diphtheria bacilli. He gives histories of patients who showed the presence of these strains in the throat or elsewhere all of which belonged to the so-called corynebacteria group of bacilli. Authorities naturally differ as to the significance of the latter—whether or not they are pathogenic at all whether they stand in some relationship to various diseases and even whether they are potential diphtheria bacilli. The patients showed very different clinical pictures. One woman with chronic pulmonary and laryngeal tuberculosis coughed up membranoid objects which gave rise to cultures of corynebacilli. This middle-aged individual had gone through diphtheria in childhood and apparently an attack of influenza had mobilized some latent infection. Despite the negative result of numerous tests the author appears to believe that this may have been an example of diphtheritic tracheobronchitis of a very atypical nature. These atypical organisms have been found in a number of affections of the respiratory tract and especially in tonsillitis of intrinsical disease. A second patient of the author showed numerous points of agreement with the first. On the other hand in a patient with mastitis and high fever the pus evacuated showed apparent diphtheritic bacilli and Professor Clairmont actually made use of antidiphtheria antitoxin in this patient. The mother and three children who played about her bed had their throats remained free from any of the corynebacilli. Study of the literature shows that various and very dissimilar affections have caused the suspicion of latent or masked diphtheria yet thus far all evidence of true clinical diphtheria has been wanting.—*Sonderabdruck aus der Medizinischen Wochenschrift* December 28 1928.

Myocardial Degeneration.—With the object of establishing a clearer conception of myocardial degeneration Basil Parsons-Smith analyzed the records of 50 cases of this condition in adults ranging in age from 37 to 75 years. The outstanding symptoms were: Breathlessness in 80 per cent anginal phenomena in 44 per cent giddiness fainting syncopal attacks in 40 per cent cough in 20 per cent hemoptysis and wheezing in 8 per cent and some oedema and deficient mentality in 4 per cent. The pulse findings included a wide range of abnormalities: in 70 per cent of the cases it was raised to 100 or over in 8 per cent it was reduced to 40 or under. In a large proportion of the cases the pulse tension was raised irregularities of rhythm were present and cardiac enlargement was obvious. The area of dullness was in no way characteristic. Frequently there was dilatation of the tricuspid area. Many of the heart sounds and murmurs were of poor quality. A combination of poor quality of the first sound with a relatively accentuated second sound was frequent. The blood pressure readings showed wide variations. The group of phenomena peculiar to conditions of the circulation bore witness to the unbalanced vasomotor circuit. Many very widely differing abnormalities were also

a man who holds himself out as a specialist is in fact such Doctors know whether he is or not, but all the public knows about it is what he himself represents Would it not be wiser for the profession to regulate this matter than to have the regulation come from inexpert and possibly hostile sources? Would it not be better for the doctors themselves to devise some system by which the public could be assured that an alleged specialist is in fact such, rather than to have an unfriendly legislature proceed to this without the advice, the help and the leadership of you who are best qualified to advise about it?

At this time, too, we hear much of commercialism both in law and in medicine A man whose chief objective is the acquisition of wealth makes an initial mistake when he enters the ranks of either of these two professions for that purpose Men of unusual attainments in these professions often acquire considerable wealth, but this comes or should come as an incident rather than as a predetermined objective of a professional life The lawyer should dedicate himself to the cause of justice, the doctor to the cause of health The first consideration of the professional man should be the interests of his client or his patient, not the amount of the fee which may be derived from the professional relationship The amount of compensation in any case is a matter of civil contract but the public and indeed the law itself is zealous that there should be no overreaching The amount of the fee charged in any case should be based upon the following essential factors

First, the character and nature of the malady

Second, the amount of time and effort expended

Third, the result achieved

Fourth, the standing experience and professional position of the physician, and

Fifth, the patient's ability to pay

No one of these considerations should be paramount to any other, all of them should be considered A physician should be as just as honorable and as fair in treating the patient's pocketbook as in administering to his physical condition Overreaching injures not only the individual physician in his standing and his reputation, but the entire profession as well

Then too, the public as it scrutinizes your profession, observes some men engaging in practices either fraudulent or directly criminal Your profession is not helped by those who engage in criminal operations The existence of the abortionist in every community is a notorious fact. He should be stamped out, but he continues nevertheless to flourish Not only does the abortionist violate man's laws and God's, but usually these conscienceless practitioners maltreat their patients in so shocking a way, through the failure to use ordinary aseptic precautions and the ordinary principles of surgery, that death or grievous bodily injury is the result This subject is not a pleasant one, but it should be met boldly and courageously by the profession itself If you do not meet it, the public may meet it for you.

In the recent ambulance chasing investigation conducted in New York City, shocking disclosures were made "A close connection," said Mr Justice Wasservogel, who so ably conducted the investigation, "is frequently found between the physician and the 'ambulance chasing' lawyer In a great many cases the physician recommended the lawyer, and occasionally the lawyer suggested the physician In some instances the testimony or certificate of the physician was used to bolster up claims for injuries which were never sustained or were grossly exaggerated" Numerous disbarment proceedings are now in progress and it is believed that many of the lawyers who engaged in reprehensible practices will be disbarred. The doctors' Grievance Committee is also at work and will deal justly, but sternly, with those physicians who are found guilty of improper conduct

It is not a pleasant task to catalog the various criticisms which are and can be leveled against the medical profession, and yet it would be serving a good purpose could all of these be marshalled, studied and proper action taken Criticisms from the public should be carefully considered, not ignored Where the criticism is unfounded, this should be established Where it has been well taken, prompt steps should be followed to remedy the condition The future of the medical profession is in your hands and those of your high-minded colleagues in every state These subjects require attention and study When just conclusions have been formulated action should be taken For all of this the co-operation of the entire profession is required, but most of all leadership is demanded Choose the leaders whom you trust and then follow them, support them, encourage them, and back them up Your profession needs more rather than less leadership My observation is that yours is a difficult profession to lead You are essentially individualists Doctors find more difficulty in co-operating one with the other than is discoverable in most other callings The individual physician relinquishes with difficulty, if he relinquishes at all, his individual opinion even after the majority has spoken This is one reason why constructive legislative medical programs are so difficult to put through After a decision has been

LEGAL

By Lloyd Paul Stryker, Esq.
Counsel, Medical Society of the State of New York

THE DOCTOR AND THE PUBLIC*

Gentlemen of the Hudson County Medical Society

Although in what I have to say tonight I am speaking for myself alone, nevertheless as general counsel for the Medical Society of the State of New York, I take great pleasure in bringing to you the greetings and good wishes of that great organization, composed as it is of nearly twelve thousand practicing physicians

The medical profession, like all other callings and professions, is in the crucible of debate and is under the microscope of public scrutiny Many of the criticisms which are leveled against the medical profession are without merit Some of the criticisms, no doubt, deserve a careful study

Take, for example, the question of fee splitting now so much discussed in all the public prints The public is aroused to this situation and demands an early answer as to whether or not the medical profession as a whole sanctions and approves this practice The relationship between the physician and his patient, like that subsisting between the lawyer and his client, and the priest and his penitent, is one involving the very highest degree of trust, confidence and good faith It is the duty of the professional adviser at all times and in every detail of his relationship with the man who trusts him, to deal openly and with perfect fairness and good faith When a patient is advised by his family physician that he is in need of operative intervention or some other procedure which the family physician feels himself unable to accord, the patient when he is advised that he must secure the services of a specialist and requests his family physician to secure that specialist for him, should have no reasonable basis for a doubt as to whether or not the surgeon or the specialist secured is retained upon the sole ground of ability and competence rather than for the reason that the family physician may profit by arrangement The term "fee splitting," as monly understood, means the splitting of without the knowledge, consent or approf the patient, and therein lies its vice t-minded man," said Dr John A Hartwell, President of the New York Academy of Medicine, recently, "can justify this fee splitting, and disaster, if not disgrace, threatens the profession if it is tolerated" Further, Dr Hartwell said "In essence, fee splitting amounts to the family doctor's receiving a rebate from the specialist for a service for which he is charging a separate fee without the patient knowing that such a rebate is being paid It results in two evils First, the selection by the family physician of a specialist who will pay the rebate, which may readily lead to the employing of a less qualified man than would be otherwise obtained, and, second, an increased charge by the specialist to cover the unacknowledged rebate It is a secret understanding between two professional men which they dare not bring into the open"

You doctors hold yourselves out to your patients as men of honor, character and integrity Undoubtedly the overwhelming and vast majority of your number are justified in these representations, but any doctor who, relying upon the confidence thus imposed, seeks to make a secret and undisclosed profit from his patient, not only violates the sacred obligations which rest upon him as a professional man, but injures the entire profession by lessening the high repute in which it should be held The medical profession should not wait for the public to enact laws upon this subject, but should take the lead in stamping out this or any other practice which does not accord with the high standards of your calling

Now that the profession has been so largely subdivided into various specialties, the public is taking an increased interest in the question of specialists and is asking what is the specialist? A specialist presumably is one who has made an unusual study and through practice has become peculiarly adept in some particular department of medicine or surgery But for a man to call himself a specialist does not make him one There are, unfortunately, some self-styled specialists who do not deserve the title Some men hold themselves out as having special qualifications in some particular field, when the justification for such a representation has all too little basis The ranks of specialism increasingly have attracted followings The public wants to know whether

the Hudson County Medical Society of New
1929, at the Hotel Pennsylvania.

unjust and improper inroads upon the legitimate professional incomes of those physicians whose practice is diminished by losing to charity those persons who should be private patients The general public has no more right to demand that a doctor should work for nothing than that it should be carried on a railroad free of charge, or should be permitted to send telegrams without paying for them

By way of comparison between you and your predecessor of an earlier day, we hear much from time to time in praise of the old family doctor He struggled through the snows of winter and drove long miles into the open country in the stormy nights He acted without thought of wealth or the hope of fortune Sometimes he was paid small fees for his great service, sometimes he was paid in kind by eggs or vegetables of the farmer—often he was not paid at all But he achieved the love, the affection, the regard, the respect and the following of his community Although he was unacquainted with thousands of the discoveries of science with which you are familiar, although he was deprived of innumerable diagnostic aids such as radiography and fluoroscopy, and the various clinical and laboratory tests which are the commonplace of medical practice now, he served his day and generation well, maintained his self-respect, achieved honor and established himself in the affections and the regard of his community He held a position of greater influence and leadership than that possessed by the average practitioner today In part this was due to the different world in which he lived and in part to his attitude towards himself, his patient and the community

The doctor of today is better equipped, knows more, has the advantages of the countless discoveries of science, but with all this finds himself held in less esteem than his confreres of a former generation Why is this so? One reason may be the growing disappearance of the general practitioner and his supplanting by innumerable specialists Another reason is that the modern physician is less of a character in his community, takes less part in public affairs, is more busily absorbed in the details of his practice and hence, finds it more difficult to seek or to assume that position of leadership which would be his for the asking

What I have here said tonight may seem depressing, but there should be no more depression in studying these facts than in your scrutiny of symptoms in an effort to make a diagnosis to formulate a prescription and to effect a cure in any private case I do not come to bring you a message shot through with gloom or weighted with despair, rather I should like to speak stimulating words of hope I know the medical profession as few laymen know it Probably I know more individual doctors than any other layman living, and I come away from my contact always with a renewed confidence in your great calling and those who ply it. In knowledge and ability you are incomparably greater than your predecessors In character, I am sure you are their full equals Despite the fact that into your profession there have entered some men who never should have been allowed to practice medicine, just as there are many who disgrace the calling of the law, it is my deliberate opinion that there is no body of men comparable with yours in the matter of character, unselfishness and service to mankind You are not sufficiently understood or appreciated by the public You do not sufficiently take the public into your confidence You should more carefully understand your public and seek a closer contact with it Criticism and suspicion are the weeds of ignorance and misunderstanding Enlighten your public, let them understand what you are and what you do, get your public with you, educate your public, lead it Then when new inroads are made upon your individual liberty, when new and improper nostrums are suggested to curb and to restrict you in your professional life, you can enlist the public as your friend, champion and defender

INFLAMMATION OF THE EAR—CLAIMED BURN DUE TO TREATMENT

In this case it was charged that the doctor while treating the plaintiff, a man about 36 years of age, for ear trouble, prescribed a poisonous curative and advised the plaintiff to use the same, as a result of which he sustained serious burns to his ear and face

This patient came to the doctor's office complaining of pain when chewing and moving his jaw and also pain over the mastoid antrum and tip, and furuncles on both anterior and posterior walls of ear canal An examination disclosed that the drum could only be seen with difficulty The doctor made a diagnosis of acute inflammation of drum of the ear The doctor prescribed a proprietary medicine to be applied on cotton three hours on and three hours off, also applications of hot water bag or flaxseed poultice on the ear He told the patient to return, but the patient did not follow these instructions

After the case had been on the calendar for some time, plaintiff's attorney finally discontinued, thus terminating the action in the doctor's favor

reached by a medical society, acting either collectively or through its accredited representatives and definite conclusions have been arrived at, it all too often happens that the minority is still vocal and ofttimes is found actively opposing that which the majority has decided to support In this way constructive measures are ofttimes endangered and many times defeated The doctors have much to learn in the matter of co-operation and group action

You have not yet sufficiently learned, after you have done your utmost to further your individual opinion and have not prevailed, to co-operate in sponsoring the program which the majority of your profession has endorsed Therein lies your weakness You cannot expect to receive the support of the public or to gain the ready ear of the legislature, unless you come forward with a united front In your private councils, advocate your views fearlessly, struggle for their recognition, but after you have done this, if you are overruled, stand by the majority as loyally as though it had expressed all that you had sought The adoption of this principle is the success of political parties, of labor movements, of all group activities and of democracies themselves In all the great questions that confront us, such as the questions of public health, the public does and should look to you for leadership But if when it looks, it finds you wrangling and divided, it will turn away and will perhaps exert a leadership for you which you have failed to exert for yourselves Choose your leaders—real leaders—and when you have chosen them, follow them and support them

It is not uncommon to hear doctors complaining of the red tape and the restrictions which surround them, and no doubt many of the complaints are justified, but we are living in an age of regulation The only way in which you can escape more regulation is by demonstrating to the public that it is to the public's interest that there should be no more You cannot make this or any other demonstration without co-operation and without leadership

I have spoken of but a few of the criticisms and the questions which should engage your anxious scrutiny There are many more Anyone of you could make a far larger catalog than I have done

The great, the vital and the pressing questions affecting your profession are all too little discussed and analyzed among you Too many doctors' meetings are taken up with details, personalities or unimportant points of parliamentary procedure More time could profitably be employed in the consideration of the great questions confronting medicine and in a constructive effort to meet and solve them In the mechanics of your organizations, you might with profit look to the business-like dispatch with which commercial enterprises are conducted In this way more time and effort can be devoted to the great questions affecting your profession, and the likelihood would be greater that you will solve them rather than have a hostile public solve them for you

You face, as we all face, the increasing danger of the curtailment of public liberty and of our right to be and act as individuals There are many voices in the public demanding state medicine, a system whereby all may be treated without cost I know of no graver injury which could befall not only the medical profession, but the public as well, than the inauguration of state medicine Such a program would stamp out all of the initiative, the enterprise and the individualism of the doctor Eliminate these qualities, and you have made him a mere machine, a civil servant, a mechanism without ambition and without hope. Yet in the last analysis the people of this country will get and will have what they want. It is the duty of educated leaders to see to it that the public are educated to demand that which is best Without your leadership and your guidance, the public may some time demand that all medical service shall be furnished by the state free of cost It is for you to point out to the people and to educate them that such a course would ruin the best qualities and the best ability which your profession has to offer

I state without fear of contradiction, that there is no class in the community that renders so much charitable service as the medical profession Every busy physician spends at least one-half to two-thirds of his time in giving gratuitous service to the poor The patients in our charitable hospitals receive the benefit of the very highest class of medical and surgical attention without cost Doctors give to these patients the same anxious study, care, zeal and attention as that which they expend in behalf of those who compensate them liberally This is a splendid thing It is not sufficiently appreciated or understood by the general public I wish that the legal profession could point to as fine a record in that regard Despite this, however, we hear from all sides increasing demands for charitable service Many of these demands are made by those well competent to pay for what they get and who should not seek or expect charitable medical attention Unjustified demands for charity of this kind result in three evils First, an unjust and improper burden upon the individual practitioner of medicine, second, the inevitable diminution of self-respect which must be the result where a person who is not entitled to charity asks and receives it, third

NEWS NOTES

LEGISLATIVE BULLETIN No 6—FEBRUARY 23 1929

The following bills in which we have an interest were introduced since the last bulletin was written

Workmen's Compensation

Senate Int No 791—Gates, Assembly Int No 1090—C P Miller, amends the Labor Law by providing for a state medical advisory committee as an adjunct to the council, and appropriates $5,000 00 to cover the expenses of the board. This is the bill in which we were so vitally interested last year and which passed the Senate, but failed in the Assembly because it lacked an appropriation for paying the expenses of the council That fault has been corrected by requiring an appropriation of $5,000 00, which amount it is assumed will be sufficient to meet the expenses If at the end of the year it is found that this is not enough or is too much, in another year the amount may be more definitely stated May we suggest that each chairman immediately communicate with his Senator and Assemblyman, asking their active support of this bill As we stated last year, it is probably one of the most important steps that the state can take in clearing up the confusion that at present exists in the administration of the medical phases of the Workmen's Compensation Law

Mental Hygiene

Senate Int No 865—Baumes, Assembly Int No 1160—Esmond, adds new section to the Mental Hygiene Law, creating a board of psychiatric examiners consisting of mental hygiene commissioner and the education and health commissioners, who shall determine qualifications of psychiatrists qualified to act in any criminal proceeding Mr Baumes has encountered some difficulty in securing competent medical service in the mental examination of criminals, and this type of examination has recently grown so popular that it is necessary that the court make provision for such examination, in certain types of cases at least The present bill was drawn up by the members of the crime commission, with the assistance of the State Departments of Health and Mental Hygiene We particularly urge that you read the bill carefully and give us immediately a statement of your reaction to it We are confident that the bill will be moved and, if it should be amended, we should like to have your advice as early as possible in order that the amendment may be properly considered

Hospital Fire Alarms

Senate Int No 813—Wales, Assembly Int No 1132—Whitcomb, would require asylums, almshouses, hospitals, orphanages and schools in cities and other municipalities having central fire alarm station, to be equipped with fire alarm boxes This bill was turned down by the legislature last year on the ground that it would unreasonably increase the expense in a great many instances

Progress on Bills

Senate Int No 182—Fearon, Assembly Int. No 628—C P Miller, workmen's compensation, radium, has advanced to third reading in both houses

Senate Int No 370—Webb, Assembly Int No 544—Rice, mentally retarded children—has been reported out of committee in the Senate

Senate Int No 522—Westall, health camps and preventoria—advanced to third reading

Senate Int No 402—Pitcher, Assembly Int. No 596—Lattin, amending Health Law with regard to duties of health officers—has advanced to third reading in the Assembly

Senate Int No 409—Pitcher, Assembly Int No 621—Lattin, water purification—reported out of committee in the Assembly

Senate Int No 408—Pitcher, Assembly Int No 623—Lattin, water supplies—reported out of committee in the Assembly

Hearings

Feb 26—2 P M Senate Int No 261—Webb, Lien Law, hospitals As Int No 467—Lattin, (Joint) Judiciary Committees This bill will be amended so as to give physicians and nurses the right of protecting themselves by lien, as well as the hospital

Feb 27—2 P M Senate Int No 466—Pitcher, Health Law, vaccination As Int No 679—Lattin, (Joint) Public Health Committees

March 5—2 P M Before joint Committees on Finance and Ways and Means, five bills on old age welfare.

At the joint hearing on Tuesday the 19th, before the Public Health Committees, no opposition was presented to the sterilization bill (Senate Int No 289—Brown, Assembly Int No 338—Dominick), nor was any opposition presented against the water pollution bill (Senate Int. No 438—Freiberg, Assembly Int No 660—Swartz), which had a hearing on the same day before the Senate Finance Committee

LONDON LETTER

LONDON LETTER

The King—At last there seems a lessening of the tense anxiety and apprehension which has pervaded not only England but so many communities throughout the world to whom the King of England stands for so much more than just a representative of an hereditary monarchy This long drawn-out struggle with Death is ending, and convalescence is becoming established slowly but surely The last report that there is now no trace of the original infection of the lung has brought relief to the whole Empire and we may reasonably hope that as the days lengthen into spring our King will be restored to us in sound health Nothing gratified me so much during my recent tour in America as the keen interest taken by all in the daily bulletins, and one feels, illogical as it may seem, that our Royal Family forms a link between the two great English-speaking nations God save the King!

My American Visit—I have just returned from an all too short visit to America I was invited to deliver the Mütter lecture before the College of Physicians of Philadelphia, and seized the opportunity to get a hasty glimpse of your great teaching institutions and meet men whose work has made their names famous throughout the world To a visitor from an old country the sudden transition from the almost barbaric massiveness of the Presbyterian Hospital of New York to the serene simplicity and dignity of the College of Physicians at Philadelphia, and then on to the modern activities of Johns Hopkins at Baltimore, presented a kaleidoscopic picture which emphasizes the amazing versatility of your great country In Philadelphia I was given the opportunity of meeting three veteran surgeons Professor Keen on the eve of his ninety-second birthday welcomed me to his quiet room, and after apologizing gracefully for his absence from my lecture on the ground that he was not allowed to go out at night, entertained me with delightful stories of his experiences in the Civil War I had hoped to have heard from his own lips the story of his operation on President Cleveland while weekending with him on his private yacht on the Potomac, but time was short and I had to bid him adieu, with many messages from his friends in England And then on to Dr da Costa whose trying bodily infirmities do not seem to have dimmed his amazing vitality Later on I was privileged to see Dr Deaver at an operation clinic, conducted with that effervescent bonhomie that has made him famous for all time as a teacher The esteem, almost love, which all bear towards Dr Deaver was well evidenced at the presentation of his portrait group, a ceremony which I was fortunate enough to witness

My next call was at Baltimore, and at once, so spontaneous was my welcome at Johns Hopkins that I felt myself almost a part of this great university Dr Dean Lewis, Dr Thayer, Professor Welch, and my old friend (if I may so term him) Dr Finney did the honors, and gave me the opportunity of meeting and seeing the work of many of the keen group of teachers on the University staff It is not too much to say that I was enthralled by the organized enthusiasm I saw around me, and a little envious perhaps of the perfection of equipment which seems so difficult to obtain in our country We are so used in England to take for granted that a University is immeasurably old, that it is quite a shock to realize that Professor Welch, just undertaking his third and latest charge, could be an original Founder of Johns Hopkins Each new activity he assumes seems to make him younger, and I am seriously considering his offer, when my time comes to retire, of a sunlit room on the upper floor of his fine new building where I could settle down peacefully to my old love, the study of the History of Medicine. I do not believe that Professor Welch will be a day older when I am helped out of my bath chair to take the lift to his sanctum and control my quavering voice to say, "Please, sir, I've come"

American hospitality is proverbial, and if I say I have received full measure and brimming over, I shall still leave unexpressed my gratitude to my many hosts From the moment of my greeting on the station platform at Philadelphia by my good friend Dr Lyon, to my last evening with Dr Finney and his family at Baltimore, I received nothing but the greatest kindness My old friendships are better established, and I hope I may say that I have made some new friends whose visits to the Old Country I shall eagerly await

H W Carson, F R C S, Eng

has been amended in both houses at the nurses' request

Senate Int No 402—Pitcher, Assembly Int No 596—Lattin, amending Health Law with regard to duties of health officers—has passed the Assembly and gone to the Senate

Senate Int No 182—Fearon, Assembly Int No 628—C P Miller, workmen's compensation, radium—has gone to the Governor

Senate Int No 438—Freiberg, Assembly Int No 660—Swartz, water pollution—has been amended and recommitted

Senate Int. No 409—Pitcher, Assembly Int No 621—Lattin, water purification—has advanced to third reading in the Assembly

Senate Int. No 408—Pitcher, Assembly Int No 623—Lattin, water supplies—has advanced to third reading in the Assembly

Senate Int No 411—Pitcher, Assembly Int No 625—Lattin, relative to local health officers—has advanced to third reading in the Assembly

Senate Int No 466—Pitcher, Assembly Int No 679—Lattin, vaccination—has advanced to third reading in the Assembly

Senate Int No 467—Pitcher, Assembly Int No 680—Lattin, prevention of rabies—has advanced to third reading in the Assembly

Senate Int No 565—Pitcher, Assembly Int No 810—Lattin, health districts in state parks—has advanced to third reading in the Assembly

Senate Int No 813—Wales, Assembly Int No 1132—Whitcomb, hospital fire alarms—has been reported out of committee in the Senate and advanced to third reading in the Assembly

Assembly Int No 566—Dickey, habit forming drugs—has been amended and still remains with the Codes Committee

Hearings

March 5—2 P M Five bills on old age welfare, before joint Committee on Finance and Ways and Means

March 6—2 P M All bills relating to occupational diseases before Joint Labor Committees

March 13—2 P M Senate Int No 112—Love (Assembly Int No 523—Esquirol), habit forming drugs—Senate Health Committee

The Senate Judiciary Committee accorded the hospital lien bill a hearing on Tuesday There appeared in its support representatives of the State Hospital Association and several prominent superintendents of hospitals, and your executive officer The opposition consisted of representatives of the New York Central Railroad Company and the trolley companies of New York City Prominent members of the bar had also filed opposition It is possible that the bill may be amended so as to limit its application to cases that come into court. We are inclined to accept such amendment, feeling that half a loaf is better than nothing at all

We have been informed that the Regents, before adjourning on Washington's birthday, took a vote as to whether they should support the osteopaths in their request, and decided that they would not

Considerable opposition is developing, particularly among dentists, to the Department of Education's bill—Senate Int No 512—Webb, Assembly Int No 755—Rice—which we announced as an effort on their part to establish uniform regulations for the various professional examining boards The Regents have announced that on Saturday morning, March 2nd, they will give a hearing upon the bill in New York City

Assembly Int. No 362—Higgins, is a bill we did not call to your attention to before, but we have decided that it may, after all, have a considerable general interest. Mr Higgins would amend the Civil Practice Act by raising the amount of wages from $12 00 to $35 00 or more per week, which can be garnisheed for the security of debts Collection agencies have informed us that this would prevent them from collecting a great many debts for physicians, and they also feel that the present law does not work a hardship in that it permits the court to require ten per cent of the weekly salaries when it amounts to $12 00 or more, but also permits the court to use its discretion as to whether the amount may not be less By raising it to $35 00, of course all weekly salaries of less amount would be exempt

The Christian Scientists are making an effort to have included in the Poor Law bill the following definition of medical care, which would permit them to treat cases in hospital "'Medical care' shall include any remedial care or treatment lawfully practiced in this state" We have called the attention of the sponsors of the bill to the regulation adopted by the American Medical Association, the American College of Surgeons, the Catholic Hospital Association, and the Protestant Hospital Association This regulation, which is common to all of these associations, specifically states that none but regularly licensed, practicing physicians may be admitted to membership on the hospital staff or treat cases on the wards

---

We want to thank those who were good enough to write us their opinions on the bills submitted with our last bulletin We hope that the number of interested chairmen may increase, because we are largely dependent upon their suggestions and are exceedingly grateful for the assistance they thus render us

Henry L K Shaw,
Harry Aranow,
Garrett W Timmers,
Committee on Legislation,
Medical Society of the State of New York

Approximately five hundred people, equally divided in number, appeared for and against the Remer contraceptive bill at the hearing given by the Codes Committee on Tuesday, February 19th For a number of years interest in this bill seemed to be lagging and, without doubt, the interest this year was stimulated materially by the entrance into the discussion of women's organizations and church groups Opposition to the bill was so pronounced that it is quite likely to share the fate of its predecessors

---

We learned that the osteopaths requested the Regents' support for the following amendment to the medical practice act that "A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform surgery involving the opening of a natural body cavity, or the amputation of an extremity, or other surgery generally *considered hazardous to life* Notwithstanding the foregoing provisions, a person licensed to practice osteopathy may use in the treatment of patients the following therapeutic agencies—anaesthetics, antiseptics, vaccines, antitoxins, and narcotics by administration but not prescription" The Regents Committee on Law and Legislation gave the osteopaths a hearing on the matter Friday, February 22nd The Medical Society was invited to send representatives to the hearing, and the following attended Dr Shaw, Dr Trick, Dr Card, Dr Sadlier, the counsel and the executive officer In our opinion, the osteopaths fell short of their expectations

We are enclosing a copy of the ambulance chasing bill (Sen Int No 281—Sheridan, As Int No 364—Moran), which we reported in bulletin No 2 as having been introduced We should like very much to have you read this bill carefully and immediately advise us whether, in your opinion, it should be enacted into law There are several bills similar in character, only relative to the profession of law, before the legislature, indicating that it is quite likely some measures will be taken to correct the deplorable conditions mentioned in Commissioner Rogers' report

There is a rumor that the legislature is planning to adjourn about the middle of March.

HENRY L K. SHAW,
HARRY ARANOW,
GARRETT W TIMMERS
Committee on Legislation,
Medical Society of the State of New York

LEGISLATIVE BULLETIN No 7—March 1, 1929

The following bills in which we have an interest were introduced since the last bulletin was written

STATE DEPARTMENT OF HEALTH

Senate Int No 1032—Downing, Assembly Int No 1325—Alterman, amends State Charities Law, dividing cost on 50% basis of maintaining and treating children in the state orthopedic hospital for children between state and county in which child resides, where cost has not been paid by parents or other persons

Senate Int No 1037—Pitcher, Assembly Int No 1337—Lattin, adds new section to the Health Law, requiring state to pay one-half of salary of health officer in every city of 50,000 or more, but only $3,000 if salary exceeds $6,000

Senate Int No 1057—A J Kennedy, provides that vaccination requirement shall not apply to minor whose parents or guardian object to his vaccination

OLD AGE ASSISTANCE

Senate Int No 1069—Antin, creates temporary commission to ascertain most practical and efficient method of providing security against old age want and appropriating $25,000

CHIROPRACTIC

Assembly Int No 1384—Esmond, chiropractic bill We have not yet seen this bill, but we notice that it has been referred to the Ways and Means Committee, which may indicate that it carries an appropriation If it does, in our opposition we shall make the most of that feature and thereby elicit the support of all those economically inclined

WORKMEN'S COMPENSATION

Senate Int No 1801—Kirkland, Assembly Int No 1391—Goodrich, amends Labor Law generally by providing, among other things, for a council of industrial standards and appeals, to replace the industrial board, and creating a workmen's compensation board, referees to be appointed on recommendation of workmen's compensation board at $8,000 a year, and appropriating $41,500

Senate Int No 679—Mastick, Assembly Int No 1228—Moffat, amends Workmen's Compensation Law by providing compensation for all diseases arising out of employment

PROGRESS ON BILLS

Senate Int No 323—H D Williams, Assembly Int No 416—Lattin, nurse registry bill—

METHOD OF MALPRACTICE DEFENSE

The following correspondence was occasioned by a paper by Mr Lloyd P Stryker, Counsel of the Medical Society of the State of New York, on "The Legal Aspects of the Practice of Medicine," which was presented before the Geneva Academy of Medicine on January 10, 1929, and was published on page 211 of the February 15 JOURNAL Dr Thomas W Maloney, of Geneva, wrote to Dr Harry R. Trick, President of the Medical Society of the State of New York, asking for further light on the questions suggested by Mr Stryker's paper Dr Trick referred the questions to the Executive Committee of the Council of the Medical Society of the State of New York, which authorized a formal reply to the questions, and directed that the reply be published in the NEW YORK STATE JOURNAL OF MEDICINE

The following are the letter and the reply—*Editor's note*

My dear Dr Trick

In order to clear my mind of a possible misapprehension as regards the defense for mal-practice featured by the State Society in case of suit against its members, I request you to furnish me with the information embodied in the following questions

As a prelude to the questions, I offer the following information Mr Lloyd Paul Stryker, Counsel of the Medical Society of the State of New York addressed the members of the Geneva Academy of Medicine on Thursday, January 10th, 1929, reading a paper entitled "Legal Aspects of the Practice of Medicine" On the same evening Mr H F Wanvig of New York who at the request of the State Society in 1921 organized and has since supervised the present Plan of Group Insurance also read a paper, the subject of which was "The History and Significance of the State Society's Group Plan of Insurance" These papers were both opened for discussion. During the discussions, it was brought out by Mr Stryker that any member of the State Society was within his rights and was privileged to carry his insurance against mal-practice in any company which he chose, but that if any member of the State Society carried his insurance in any company except the Aetna, he—Mr Stryker—would not participate at the trial except as Chief Counsel of the defense He stated further that the facilities of his office, in so far as the investigation of the circumstances leading up to an alleged mal-practice action was concerned, would be extended to any member of the State Society and he stated also, in substance, that his office would assist any counsel in the preparation for trial

Assuming that an insuring Company, other than the Aetna, preferred to employ as Chief Counsel, another than who represents the Medical Society of the State of New York, and assuming that the Counsel of the State Society refused to act as an associate in the defense, the conclusion appears to be that the member would not receive the defense to which his membership in the State Society entitles him and which defense is given to the members insured in the Aetna Insurance Company

The defense in case of suit for alleged malpractice always has been considered by the members of the State Society as one of the most valuable features of membership therein For this reason it is believed the following questions and answers thereto should make clear to the members of the State Society just what they may expect in case they are unfortunate enough to be sued for mal-practice

Questions

(1) Does the State Society provide its members with defense in case of suit for malpractice?

(2) Does the State Society provide defense against malpractice for those who are insured in the Aetna Insurance Company?

(3) Does the State Society provide defense against malpractice to its members who are insured in the companies other than the Aetna Insurance Company?

(4) Does the State Society provide defense against malpractice to its members insured in the Aetna Insurance Company in a different degree than to those who are insured in any other company?

(5) "Regardless of who the insurance carrier is, and if it is satisfactory to said carrier, *would* Mr Stryker, State Society Counsel, have to take the case of a State Society member should such occasion arise?" (this question by request of Dr Crance)

(6) Has the State Society changed its constitution and/or by-laws as regards the defense against malpractice since the organization of the Group Insurance Plan in 1921?

My dear Dr Maloney

Your letter of January 18, 1929 addressed to Dr Trick, was referred by him to the Executive Committee of the Medical Society of the State of New York for its consideration This Committee after consideration and after conference with Mr Stryker, has decided to reply to your letter to Dr Trick.

LEGISLATIVE SPECIAL BULLETIN—MARCH 4, 1929

The Esmond Chiropractic bill—Assembly Int. No 1384, Print No 1533—is of the same character as those he has introduced in former years It provides for the appointment of a special examining board by the Governor, the only qualifications of the members shall be that they are chiropractors He has taken great pains to outline the form of instruction future chiropractors shall be obliged to take, but, by the usual waiver clause, would license all persons who are practicing in the state at the present time The bill also would give authority to the chiropractic board to accept applications for licensure from chiropractors of other states, and although other examining boards recommend to the Regents such persons for licensure, this law would make the chiropractic board's recommendations "final and conclusive"

The bill has purposely been drawn so as to have it referred to the Committee on Ways and Means instead of the Committee on Public Health, in which it has been buried so frequently

You are urgently requested to get in touch immediately with members of this committee, and especially make certain that if your Assemblyman is on the committee, he thoroughly appreciates the importance of killing the bill

ASSEMBLY COMMITTEE ON WAYS AND MEANS

Hutchinson, Fulton-Hamilton, Porter, Essex, Lord, Chenango, Lattin, Orleans, Miller, Genesee, Robinson, Tompkins, Fake, Schohane, Pammenter, Monroe, Allen, Dutchess, Garnjost, Westchester, Borkowski, Erie, Moffat, New York, Hamill, New York, Howard, Kings, Eberhard, Bronx

HENRY L K. SHAW,
HARRY ARANOW,
GARRETT W TIMMERS,

Committee on Legislation,
Medical Society of the State of New York

LEGISLATIVE VERY SPECIAL BULLETIN—MARCH 6, 1929

We are sorry to say that we have what we consider very accurate information to the effect that the chiropractors are unusually confident of achieving success this year They are boasting that they have the support of the leaders of the majority party, and we must confess that it does seem strange to us that the bill, which is practically the same as that of preceding years, was not handed to the Committee on Public Health, but placed with the Committee on Ways and Means We do not believe for a minute that the boast which they are making is well founded, but, nevertheless, our experience with legislative matters convinces us that a legislator supports his arguments by the volume of support or opposition he receives to the measures under consideration, and so we urge, *urge, URGE* that you immediately write to the persons named below, and that you also ask every physician and lay person to do the same Make your opposition on the ground that to admit chiropractors to licensure would be to lower the state's educational standards The state is proud of its high educational standards, and rightly so, and there could be no greater calamity to the Department of Education's wonderful achievement than to admit a group of people, although few in number, to a professional standing, who can offer very little more than a high school training

Ask your associates in the professions of law, dentistry, and education to add their protests to yours These letters should be directed to the following four persons, as well as to your own Senator and Assemblyman

Hon H Edmund Machold, 9 E 41st St, New York City—Chairman of the Republican State Committee

Hon Joseph A. McGinnies, Speaker of the Assembly, Assembly Chamber, Albany

Hon Russell G Dunmore, Majority Leader, Assembly Chamber, Albany

Hon Eberly Hutchinson, Chairman Committee on Ways and Means, Assembly Chamber, Albany

Get busy with this at once, and don't stop until we send you an "enough" signal

HENRY L K SHAW,
HARRY ARANOW,
GARRETT W TIMMERS,

Committee on Legislation, Medical Society of the State of New York

corporation in and for this state, upon whom all lawful process in any action or proceeding against the corporation may be served, is guilty of a misdemeanor"

A foreign corporation is any corporation which has not been created by or under the laws of the State of New York or located in the state, and created by or under the laws of the United States, or by or pursuant to the laws in force in the colony of New York before the 19th day of April, 1775 (Civil Practice Act, Sec 7, General Corporation Law, Sec 3, subd 5)

One of the methods of disposing of an action for malpractice (and where the facts require it), a necessary method of disposing of such an action is by settlement To settle is to "adjust" a loss A lawyer therefore, who might undertake to settle an action for a foreign insurance company not authorized to do business in this state, would bring himself within the provisions of Sec 1199 of the Penal Law and would thereby be engaging in the commission of a crime The same applies to the trial of such an action, for it is clear that a lawyer who tries a case, in which an unauthorized foreign insurance company is the insurer "aids the transaction" of business The statute is very clear, it says that one who "adjusts losses or *in any manner aids* the transaction of any business" of an unauthorized foreign insurance company is guilty of a crime

We have discussed this matter with Mr Stryker and he has advised us that he would not and could not endanger his professional reputation by performing any act which was or could be construed as a criminal offense We understand and endorse his attitude in this regard and would not of course, request him to do anything which could be regarded even as unprofessional, surely we would not request or sanction the commission by him or any representative of ours of a criminal offense One of the assets of this Society is the high professional standing of our legal counsel

But this does not answer your question insofar as it may concern insurance companies which are lawfully authorized to do business in this state We are informed and believe that every such corporation provides in its policy of insurance that the policyholder must take and accept the service of the counsel which that company provides No company other than the Aetna Life Insurance Company provides the services of our legal counsel If, therefore, a policyholder in such a corporation were to refuse the services of the counsel provided by such corporation and to demand the services of Mr Stryker and the company were unwilling to accept those services, such a policyholder would be guilty of a breach of his policy and would lose its benefits In the eight years operation of the group plan, a case has never yet arisen in which such a corporation has requested our legal counsel to act as an attorney in any case involving a physician covered by such a company It such a case should arise it would be covered by a resolution adopted by the House of Delegates on March 29, 1926, which reads

"*Resolved*, that the Executive Committee of the Council shall have the power to decide whether or not a member is entitled to legal defense by the State Society against alleged malpractice claim or suit, and how many times, and to what extent he shall be defended for any claim or suit, and what aid shall be rendered in case of appeal from judgment of the court, and the procedure for conducting the defense shall be that authorized by the House of Delegates, April, 1914, and such other rules and regulations as the Secretary, the Executive Committee and the legal counsel may authorize."

(4) Does the State Society provide defense against malpractice to its members insured in the Aetna Insurance Company in a different degree than to those who are insured in any other company?

The answer to question (3) is likewise the answer to this question

(5) 'Regardless of who the insurance carrier is, and if it is satisfactory to said carrier, *would* Mr Stryker, State Society Counsel, have to take the case of a State Society member should such occasion arise?

The answer to question (3) is likewise the answer to this question, except that we might add that even if the Executive Committee acting under the resolution of March 29, 1926, previously quoted, were to request Mr Stryker to defend a member of our Society insured in some company (other than the group plan carrier) and such company was authorized to do business in this State, it would in no event make such request unless such company expressly and unequivocally agreed that Mr Stryker would have full, complete and supreme command of the case, which would include the right to make such a settlement as he saw fit to make, or to do any other thing which in his legal judgment was necessary in the proper conduct thereof, absolutely free from any direction, control or supervision of such company, its officers, attorneys and agents In this connection, we would again call your attention to that sentence which is a part of the form of agreement which an applicant for defense must sign, which reads "He renounces his own and places in the Medical Society of the State of New York *full power* to defend said action and to look after his interests, through its legal counsel"

(6) Has the State Society changed its constitution and/or by-laws as regards the defense against malpractice since the organization of the Group Insurance Plan in 1921?

The answer is no Neither the defense nor the group plan agreement are a part either of the By-Laws or of the Constitution of the Society

We have endeavored thus to answer specifically your six questions

We shall first answer the six questions which you propounded, giving our answer to each question in order

(1) Does the State Society provide its members with defense in case of suit for malpractice?

The State Society provides the following defense

(a) Under the resolutions adopted by the Council on December 5, 1913, it was provided that members of our State Society in good standing are entitled to the defense of our counsel for alleged acts of malpractice committed during the time when they were members of the Society, and provided that the doctor sued furnishes to the Secretary, the Executive Committee and the legal counsel a complete and accurate statement of his connection with and treatment of persons upon which complaints against him are based, etc , and that such doctor furnish to the Secretary, the Executive Committee or the legal counsel "such other relevant information" as may be required There are also certain other requirements, among which might be mentioned, that if the doctor sued "shall without the advice or consent of the attorney of the Society, determine to settle or compromise any claim against him, he shall reimburse the Society for the expenses incurred in undertaking his defense, and in default thereof, he shall be deprived of further privileges under this resolution" Each doctor desiring to avail himself of this defense is required to sign a written agreement which provides, among other things "For and in consideration of this defense the undersigned agrees not to compromise or adjust this claim without the consent of the Medical Society of the State of New York or its attorney *He renounces his own and places in the Medical Society of the State of New York full power to* defend said action and look after his interests, through its legal counsel The undersigned agrees not to obligate the said Society to the payment of any money whatsoever for any purpose, and will help, aid and assist and cooperate with the Medical Society of the State of New York and its attorney in the defense of said action in the securing of witnesses, in the execution of any papers properly presented to the undersigned for signature and execution, and do all things necessary and proper in the defense of the above action"

(b) A member of the Society in good standing who has taken out coverage in the Society's group plan of insurance (in the Aetna Life Insurance Company) is likewise entitled to the defense of the Society's counsel Perhaps the most important feature of the Society's agreement with the Aetna Company is that this insurance carrier agrees to use and employ the legal counsel of the Society in the defense of all malpractice actions of doctors who are insured in that company under our group plan In your letter you state "The defense in case of suit for alleged malpractice always has been considered by the members of the State Society as one of the most valuable features of membership therein" It was because of the recognition of this truth and of the unusual experience and success of our counsel in the defense of malpractice actions that this condition (*i e*, the condition that our counsel be engaged by the insurance carrier in the defense of all actions covered by it) was included in the agreement Summarizing, the two methods of defense rendered by the Society are (a) the defense of uninsured members in good standing, and (b) the defense of members in good standing who are insured in the group plan

(2) Does the State Society provide defense against malpractice for those who are insured in the Aetna Insurance Company?

The Aetna Insurance Company furnishes defense in such cases, but agrees to furnish and does furnish the Society's legal counsel

(3) Does the State Society provide defense against malpractice to its members who are insured in companies other than the Aetna Insurance Company?

As to those who are insured in foreign insurance companies which have not complied with the laws of this state and are not authorized to do business here, the State Society does not provide defense for the following reasons

The Insurance Law (Sec 26) provides that "Every insurance corporation incorporated under the laws of any other state of the United States, and doing business in this state, shall keep on deposit with the superintendent of insurance of this state, or with the auditor, comptroller or general fiscal officer of the state by whose laws it is incorporated, the same amount and character of securities which a like domestic insurance corporation is required to deposit with the superintendent of insurance of this state***," The Insurance Law provides further "No foreign insurance corporation shall transact any business of insurance in this state until it has executed and filed in the office of the superintendent of insurance a written appointment of the superintendent to be the true and lawful attorney of such corporation in and for this state, upon whom all lawful process in any action or proceeding against the corporation may be served with the same effect as if it was a domestic corporation Service upon such attorney shall thereafter be deemed service upon the corporation"

Sec 1199 of the Penal Law provides that "Any person acting for himself or for others, who solicits or procures, or aids in the solicitation or procurement of policies or certificates of insurance from, or *adjusts losses or in any manner aids* the transaction of any business for, any foreign insurance corporation, which has not executed and filed in the office of the superintendent of insurance, a written appointment of the superintendent to be the true and lawful attorney of such

COMMITTEE ON SCIENTIFIC WORK

There are two prizes which may be awarded at the Annual Meeting of the Medical Society of the State of New York

The Merrit H Cash Prize—This prize was established by Dr Merrit H Cash in 1863 and is given to the author of the best original essay on a subject designated by the Committee on Prize Essays Competition is limited to the members of the Medical Society of the State of New York, who at the time of entering the competition are residents of New York State

The essay shall be typewritten or printed, and the only means of identification of the author shall be a motto or other device It shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

The Lucien Howe Prize—In 1906, the late Dr Lucien Howe, then residing in Buffalo, N Y, presented the State Medical Society with a prize fund, the interest of which is to be used by the Society for the presentation of a suitable medal for the best original contribution to our knowledge of some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York

"The method of presenting the communication and of awarding the prize shall be substantially the same as that followed in regard to prize essays That is to say, the communication shall be typewritten or printed, and the only means of identification of the author shall be a motto or other device It shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer If, in any year, the committee does not deem any essay or communication which is offered worthy of the prize, then it shall not be awarded, and the interest for that year shall be added to the principal"

The attention of the members of the Society is drawn to these two prizes It is hoped that this year many communications will be placed in competition

Prize essays must be submitted before May 15th They must be directed to the Committee on Prize Awards, Medical Society of the State of New York, 2 East 103rd St., New York City

If any identification marks other than the ones prescribed are attached to the essay, it will be debarred from the competitions

---

The Surgical Section of the Society having in charge the General Wednesday Afternoon Session has proposed the following program

"Diseases of the Breast," Dr Jonathan M Wainwright, Scranton, Pa (By invitation)

"Intestinal Obstruction," Dr John B Deaver, Philadelphia, Pa (By invitation)

"Toxemias of Pregnancy," Dr John O Polak, Brooklyn, N Y

This, we believe, will offer to all members of the Society an excellent opportunity to meet men of international reputation and hear them present their personal experiences in such a comprehensive, enlightening way that the messages they bring will be of actual value in the care and treatment of patients

We again call attention to the fact that this year there will be no section meetings on either Tuesday or Wednesday afternoons, for at those times the entire membership will gather together in one large hall and listen to the addresses of men of note and the enlivening discussions which are certain to follow

---

AMERICAN MEDICAL ASSOCIATION CONVENTION, PORTLAND, ORE

The American Medical Association National Convention will convene at Portland, Oregon, July 8, 1929 This meeting will be the occasion for the transaction of important business and constructive effort on the part of all who attend, and a representative registration is anticipated

Portland, with a delightful climate, will permit full recreation Sixteen splendid golf courses to select from—hundreds of miles of paved highways will make easily and quickly accessible beaches, mountains, forests, waterfalls, and the many other fascinating, colorful scenic attractions of the Convention City, and its beautiful environmental and recreational districts

Transportation from the Atlantic Seaboard to the Pacific Coast is always a problem involving considerable detail The Committee appointed by the President, has, after careful consideration of many plans, with your comfort and interest in mind, adopted the following arrangements

Leaving New York City at a convenient hour, June 30, 1929, traversing the great Empire State by daylight, arriving at Chicago mid-day, where time will be allowed for a brief stop, thence into the heart of the cool Great North West, arriving at Glacier National Park, where mystery mountains, valleys, glaciers, lakes and rivers, set off with forests, and gay with ever-changing flowers, will fascinate and

There is another paragraph of your letter which we will discuss briefly This paragraph reads

"Assuming that an insuring Company, other than the Aetna, preferred to employ as Chief Counsel, another than he who represents the Medical Society of the State of New York, and assuming that the Counsel of the State Society refused to act as an associate in the defense, the conclusion appears to be that the member would not receive the defense to which his membership in the State Society entitles him and which defense is given to the members insured in the Aetna Insurance Company"

We do not agree with the conclusion which you state For the benefit of its members, the New York State Medical Society retains a lawyer of high standing in his profession and one peculiarly experienced and equipped in medico-legal and malpractice matters He is not engaged to act as a subordinate or assistant to someone else, but for the purposes which his title implies, namely, general counsel The State Society by inaugurating and maintaining the system of defense which it maintains, has at heart the interests of all of the members of the Society The proper defense of each case is a matter of concern to every member of the Society and to the Society itself No professional man, whether he be lawyer or doctor, can give the best that is in him unless he is in command of the case which he assumes Complete responsibility implies complete control The trial of a law suit is not a place for differences of opinion between counsel on the same side of the case There must be one general and only one in command Mr Stryker has advised us and we agree with and endorse his position, which is that he would be unwilling to act "as an associate in the defense" where some other lawyer was acting as "chief counsel" Not only do we agree with him in this, but it is plain that his attitude is consistent with that part of the agreement which the applicant for defense must sign, namely, the sentence previously quoted wherein "He renounces his own and places in the Medical Society of the State of New York *full power* to defend said action and look after his interests, *through its legal counsel*"

For many years before the inauguration of the group plan, the only method of defense furnished by the Society was the defense of its counsel which, while an extremely valuable privilege, gave the individual doctor no protection in the event that a settlement was required or that (as must sometimes happen) a judgment was rendered against him It was for this reason, and to provide indemnity as well as legal defense of the physician, that the group plan was inaugurated The history and nature of this plan has been many times described in our State Medical Journal, a good summary of it was contained in the report of the Insurance Committee of the Executive Committee, which appeared in the New York State Journal under date of October 15, 1928, at page 1,244 The Society's sole interest in this group plan lies in the fact that through constant study by many officers and many committees, and from a long experience it has been deemed a very wise and beneficial arrangement for the individual doctors Of course, no member of the Society is forced to insure himself in this plan, if he does not desire to do so He is in this respect, as in all others, a free agent. In times past, before the inauguration of the group plan, where a physician was insured in some company, so far as we know, it was the invariable practice for such an assured to accept the service of the counsel of that company, rather than the counsel of the Society The purpose of the Society's defense is to furnish its members with the defense of its counsel where they are not insured. Where they are insured in the group plan the Society's agreement with the insurance carrier is that the insurance carrier shall provide the services of the Society's legal counsel

In your letter, you further state (referring to Mr Stryker's appearance before the Geneva Academy of Medicine) "He stated further that the facilities of his office, *in so far as the investigation of the circumstances* leading up to an alleged malpractice action was concerned, would be extended to any member of the State Society and he stated also, in substance, that his office would assist any counsel in the preparation for trial."

Mr Stryker advises us that he believes you are partially mistaken in your recollection of what he said, that he did not say that (in cases of which he was not in charge) he would extend the facilities of his office as to "the investigation of the circumstances leading up to an alleged malpractice action," but that what he did say, and what he has always done, is that in any case involving a member of the Society, whether or not he is insured in the group plan, he would be glad to confer with that doctor or the counsel of the company in which he may have insured himself, in order through such conference to advise and instruct such counsel in the duties which he may have assumed

This, however, of course, would not apply to assisting counsel for an unauthorized insurance company, as by rendering such assistance Mr Stryker might be deemed in some manner to be aiding the transaction of the business of such unauthorized company, and thereby directly or indirectly participating in a criminal offense.

We have written you at some length in an endeavor to answer all of your inquiries

Very truly yours,

HARRY R TRICK,
President

D S DOUGHERTY,
Secretary

MEDICAL WARES

ADVERTISEMENTS

Advertisements are necessary in medical journals for several reasons They inform doctors where they may obtain supplies The increased sales resulting from the advertisements enable manufacturers to improve their products and widen their distribution, and to conduct research departments, many of which rival those of medical schools in equipment and quality of work

The service rendered by medical journals, like that by a physician, is both impersonal and personal The reading matter and news columns of a medical journal are impersonal They deal with matters of general interest and no contributor profits financially by the items On the other hand, the advertisers profit by the distributing service offered to them by the Journal They are the private patients of the Journal and expect to pay for what the Journal does for them

A medical journal, like a doctor in private practice, expects to supervise its patrons, to diagnose their conditions, to prescribe the remedies, and to assist in carrying out the directions

A medical journal may assume the attitude of a drug clerk and either hand out what a customer calls for, or say that the article is not carried in stock The Journal may reply to the advertiser, "No, we do not carry that kind of advertising," or it may take the attitude of a doctor to a patient, and say, "Your advertisement is sick or defective, but here is the way to cure it, and when its defects are remedied, we will accept it"

An advertisement in a medical journal is intended to impress physicians Its first essential is that it should be scientifically truthful in its statements Advertisers in their zeal search through medical literature and are usually able to quote statements that confirm their most optimistic claims But doctors expect each advertiser to state the truth without recourse to long words which make the advertisement read like the harangue of a negro preacher

The medical profession can influence advertisers best by editing their copy and showing them wherein their claims are exaggerated or false Most advertisers seeking admission to medical journals are honest and sincere in their efforts to conform to the wishes and standards of physicians, and they say, "How can we know the copy to be edited They also say that they will try to adopt the suggestions of the editors as they prepare copy for lay periodicals, so that their advertisements shall conform to one standard To raise the standard of medical advertisements attitude of the medical profession unless doctors tell us that the quotations that we find in reputable medical books and journals do not represent the opinions of modern physicians?" It is surprising how many objectionable advertisements can be made acceptable by the change of a few words which do not affect the general style of the advertisement

Medical products whose advertisements are offered to medical journals may be divided into three classes

1 Those used by doctors only
2 Those used by both doctors and laymen
3 Those used by laymen only

There is seldom any trouble with an advertisement of an article used only by the medical or allied professions These articles are nearly always well written, scientific, and truthful, and are always acceptable to any medical journal

Advertisements of medical products sold to laymen only also give editors little worry, for they are rejected because they are written in the exaggerated style of the quack Practically all medical journals agree that cosmetics, beauty restorers, and patent medicines have no place in their columns

Advertisement articles which are sold to both doctors and laymen arouse controversy principally because the manufacturers and dealers sometimes have one set of statements for doctors and another for laymen It seems to be a principle of advertisers in newspapers and magazines that the manufacturer who makes the best claims stands the best chance of selling his goods The standard of a medical journal is that an advertisement shall tell the truth without exaggeration

There is sometimes a question as to whether or not a product, such as that for external use, shall be considered a therapeutic agent If the use of a harmless plaster or ointment allays pain, soothes a part, or relieves distress of either body or mind, it is an ethical product according to medical standards, and its use by physicians is permitted But doctors object to the claim that a household remedy can cure any disease at all

Will manufacturers and dealers accept the advice of physicians and medical editors? Experience shows that they will welcome the suggestion of physicians and accept the editing which medical journals may require Advertisers have shown a spirit of cooperation in accepting the editorial printed on page 160 of the February first issue of this JOURNAL, and are offering their

charm Invigorated by our three-day tour of this ideal vacation land, we again resume our westward journey through the Rocky Mountain section, arriving at Portland with mind clear and body rested, prepared for convention activities

On our return we will for three and one-half days enjoy the diversity and wonders of Yellowstone National Park, visit Salt Lake City, thence via the scenic Utah-Colorado Rockies paralleling the mighty Colorado River with its indescribable scenic attractions, passing through "Tennessee Pass," "Canon of the Arkansas River," with brief stop at "Hanging Bridge," visiting Denver, the Capital of the great State of Colorado, terminating our sightseeing and educational features with a visit to the marvelous region within the boundaries of the "Rocky Mountain National Park," arriving back in New York July 24, 1929

With three of our great National Parks included in our tour, and every necessary detail carefully planned, recreation, fellowship and carefree travel are our offering to the members of the State Society

We cordially invite our members and their families to join in this ideal vacation tour Your cooperation will make it possible for railroads interested to provide a special train with its many advantages for our exclusive accommodation Further announcements will be forthcoming

JOHN A CARD, Poughkeepsie, N Y,
ARTHUR W BOOTH, Elmira, N Y,
Transportation Committee

ULSTER COUNTY

The regular meeting of the Medical Society of the County of Ulster was held in the coffee shop of the Governor Clinton Hotel, Tuesday evening, February fifth, beginning with a short business session In the absence of the president, E F Sibley, vice-president, occupied the chair C T Gervais, of Milton, and Augustus S Keefe and Harold Rakov of Kingston, were elected members of the society, and Charles B J Mittlestaedt was transferred from New York County membership to Ulster County

The membership of the standing committees for the year was announced, as follows Committee on Legislation Alexander A Stern, Chairman, Mark O'Meara, Mary Gage-Day Committee on Public Health Raymond S Crispell, Chairman, Joseph Jacobson, Frederic W Holcomb Committee on Milk William J Cranston, Chairman, Hugh S Chidester, Saugerties, Frank M Holcombe, Ellenville

Dr William A Howe, Head of the Bureau of State Medical Inspection of School-children gave a talk on "School Health Program" Dr Howe expressed himself, as highly gratified over the interest being taken, in preventive medicine, both for the child and the adult In fact, he considered the prevention of all mal-adjustments in life, both mental and physical, to be a work of real progress He compared the beginnings of Medical Inspection with its part time service, with the present when there are forty-five full time Medical Inspectors in New York State He gave a most interesting illustration of the great benefits, which had come to the school-children, from medical inspection The speaker emphasized the importance of medical leadership in all this work, and he pleaded with every physician in the county to stand behind the school-medical work He believed, that close cooperation, would greatly increase the benefits of medical inspection

Statistics show that all over the state, from sixteen to fourteen per cent of the school children are retarded In some cases this was due to mental defects and in others it was due to physical He believed that when there was more ideal cooperation and better medical leadership, some of this retardation might be prevented, thereby securing greater happiness and usefulness to the individuals, as well as saving much expense to the state, for every school-repeater is an added expense to the school system In this state, women physicians had been very successful as medical inspectors At the present time 700,000 or 77% of the school children are being inspected and 580,000 defects had been discovered, some serious, others slight, and 275,000 defects were receiving attention

After a general discussion, refreshments were served, after which Dr Raymond Crispell gave a very interesting talk on Endocrinology He warned the doctors not to accept all the rosy advertisements of the manufacturing firms at full value, for our real knowledge of the internal secretions was very slight There was considerable discussion of this subject after which the meeting adjourned

The Superintendent of the City Schools, the Principal of the High School, and members of the Board of Education were the guests of the County Medical Society

F H Voss, *Secretary*

SKYSCRAPER HOMES

The impression that all New York buildings are rising higher and higher is disproved in an editorial in the New York *Times* of February 21, which says

"That New York homes, taking the city as a whole, are destined to be pitched in topless towers is not true. The great metropolises, as places of residence, are not piling up, but are decentralizing The real process now under way is not urbanization, but suburbanization

"In New York City it has been true for ten years that Manhattan of the minarets has been fast losing population The drift has been to the outlying boroughs with a moderate skyline The Bronx shelters its near two millions in apartment houses of about the same height as Manhattan buildings before the skyscraper Queens has nearly a million people living, largely, in two-story homes Inasmuch as Queens has been heavily populated by migrations from Manhattan, this means that in the city as a whole a great many more people have gone down in the world, from five stories to two, than have gone up, from five stories to fifteen or even forty-five For all our towers, business and residential, the average height of Manhattan's buildings is probably four stories, we still have miles of three-story brownstone and two-and-a-half-story brick residences, on the side streets and in the lower part of the town"

While dwelling houses in general are only three or four stories high, yet some of the most desirable houses are bungalows located on the tops of immense skyscrapers whose roofs are big enough to permit the tenants to cultivate vegetable gardens

---

SAFETY FIRST FOR CHILDREN

The safety first campaigns conducted in schools is bearing results according to the following editorial in the New York *Sun* of March 1

"In 1922 the increase in child deaths began to arouse public interest, with the result that accident prevention began to be generally introduced into school curriculums Until 1924, the safety magazine recalls, the number of children killed in accidents in the United States steadily increased The downward trend was first observed in that year Since then the reduction has continued, despite an increase in the number of vehicles using the roads and in the number of children exposed to street mishaps The saving in children's lives is more significant when it is considered that 'for the population as a whole the number of accidental deaths is going steadily upward each year'

"Of the great variety of fads and contests introduced into the schools in recent years safety education seems to be destined for a permanent place in the curriculum This is one bit of propaganda which has fully justified itself"

PUBLICITY AND INFLUENZA

The New York *Times* of March 2 draws wise conclusions regarding the effect of publicity and education in the prevention of influenza when it says

"Health Commissioner Wynne praises his department's publicity in helping to check the ravages of the recent influenza epidemic Except as this policy sometimes attempted to minimize the danger of infection, it doubtless was of educational value It served to draw attention to the necessity of simple precautions

"From England comes the report of an editorial in *The Lancet* characterizing as knaves and fools victims of influenza who do not go straight to bed This is in line with the advice published in New York Despite the fact that little is still known of the nature of the 'flu' and how it is transferred from one person to another, the presumption is that if the victim goes to bed immediately he lessens the likelihood of spreading the disease and increases his own chances of early recovery

"The world has been slow to recognize the damage caused by the various ailments which we call 'colds,' 'grip' or 'influenza' The very fact that they now bring forth campaigns of health publicity such as that to which the Health Commissioner refers is an indication that the public at large is adopting a more sensible attitude in the matter"

THE DAILY PRESS

HOOVER ON HEALTH

President Herbert Hoover, in his inaugural address on March 4, touched on health as follows, as reported in the New York *Herald-Tribune* of March 5

"There is an equally important field of co-operation by the Federal government with the multitude of agencies, state, municipal and private, in the systematic development of those processes which directly affect public health, recreation, education and the home We have need further to perfect the means by which government can be adopted to human service

"In public health the discoveries of science have opened a new era Many sections of our country and many groups of our citizens suffer from diseases the eradication of which are mere matters of administration and moderate expenditure Public health service should be as fully organized and as universally incorporated into our governmental system as is public education The returns are a thousand-fold in economic benefits, and infinitely more in reduction of suffering and promotion of human happiness"

That Congress is considering the Nation's health is shown by the following editorial from the New York *Times* of February 20 In describing a Senatorial bill to create a National Institute of Health, the editorial says

"The bill was unanimously reported from the committee It has the approval of Secretary Mellon, who points out that it would not only make possible the use of existing governmental machinery without setting up new bureaus, but might encourage private gifts to the government in aid of the study of health problems He has also stated in a letter to the chairman of the Senate committee that he is advised by the Bureau of the Budget that the appropriation which it carries "is not in conflict with the financial program of the President" This comes very near implying a Coolidge endorsement of the measure.

"Assured is the endorsement of the leading scientific societies, of the American Medical Association, the American Public Health Association and the American Farm Bureau Federation and of many other organizations interested in public health, as well as of many prominent men in the field of medicine and education, including Dr Ray Lyman Wilbur, Dr Mayo, Dr Treat Johnson of the Yale Medical School and Dr Reid Hunt of the Harvard Medical School"

The plan outlined in the bill is an expansion of present agencies which may naturally develop into a department headed by a cabinet officer

---

VIVISECTION ARGUMENTS

The New York *Sun* of March 4 prints letters from which the following excerpts are taken

"If you will write to the New York Anti-Vivisection Society, 1860 Broadway, New York, or to Vivisection Investigation League, United Charities Building, New York, you will be furnished with literature that will prove to you conclusively that animal experiments do not help to "spare a child suffering" These experiments are all compiled from doctors' books"

The next letter refers to the opinion of one who is "a firm believer in vivisection, on the theory that it is far better to take the life of an animal, if so doing will spare a child much suffering" The letter continues

"This theory appeals to what is basest and most cowardly in mankind As Bernard Shaw says 'We are prepared to snatch at any dirty receipt for immortality rather than face death like ladies and gentlemen'

"It is not one life sacrificed but countless lives, the never-ending slow, hideous torture of innocent defenseless creatures by practices which it would challenge the ingenuity of hell itself to duplicate

"Vivisection, over 2,000 years old, has never saved a single life, on the contrary, it has led the healing art into grotesque blunders D A. Pugh can verify this at the Antivivisection Society

"Morally, it is indefensible! The right to save one's life has its limits We have no right to save life (our own or another) by an act of dishonor

"We are not opposed to doctors, as such, personally, I have known many fine doctors, but we oppose devilish deeds which are as futile as they are unnatural"

Physicians should know something about these and other arguments with which antivivisectionists beseige legislators and a long-suffering, sentimental public

SKYSCRAPER HOMES

The impression that all New York buildings are rising higher and higher is disproved in an editorial in the New York *Times* of February 21, which says

"That New York homes, taking the city as a whole, are destined to be pitched in topless towers is not true The great metropolises, as places of residence, are not piling up, but are decentralizing The real process now under way is not urbanization, but suburbanization

"In New York City it has been true for ten years that Manhattan of the minarets has been fast losing population The drift has been to the outlying boroughs with a moderate skyline. The Bronx shelters its near two millions in apartment houses of about the same height as Manhattan buildings before the skyscraper Queens has nearly a million people living, largely, in two-story homes Inasmuch as Queens has been heavily populated by migrations from Manhattan, this means that in the city as a whole a great many more people have gone down in the world, from five stories to two, than have gone up, from five stories to fifteen or even forty-five For all our towers, business and residential, the average height of Manhattan's buildings is probably four stories, we still have miles of three-story brownstone and two-and-a-half-story brick residences, on the side streets and in the lower part of the town"

While dwelling houses in general are only three or four stories high, yet some of the most desirable houses are bungalows located on the tops of immense skyscrapers whose roofs are big enough to permit the tenants to cultivate vegetable gardens

BOOK REVIEWS

BRONCHIAL ASTHMA. Its Diagnosis and Treatment. By HARRY L. ALEXANDER, A.B., M.D 12mo of 171 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, $2.25

In a small compact book the author presents the latest conceptions of the subject of Bronchial Asthma and attempts to correlate the older theories with the new Lengthy discussion and arguments and technical terminology are avoided, making the work interesting to the general practitioner as well as to the specialist. The clinical side of the subject is stressed throughout. There are interesting chapters on the pathogenesis and pathological findings The immunological aspects comprise another chapter but this is presented rather summarily in order not to over-emphasize this part of the subject. The accepted methods of treatment are adequately presented and reviewed. The bibliography is fairly complete and the illustrations instructive.

The author seems to have his subject well in hand and presents it in a manner which will make pleasant reading for all who seek a broad but complete review of the subject of Bronchial Asthma in its present state.

M W

LABORATORY MANUAL OF THE MASSACHUSETTS GENERAL HOSPITAL. By ROY R. WHEELER, M.D, and F T HUNTER, M.D Second Edition 12mo of 101 pages Philadelphia, Lea and Febiger, 1928 Flexible leather, $1.75

Wheeler & Hunter is a small volume of 99 pages devoted to accurate and concise descriptions of that laboratory technique essential in diagnosis and treatment. Methods of collecting specimens, the accepted technique for the performance of the tests, and the reading of the results are described clearly and succintly For hospital use, especially for the interne, technician and pathologist, it contains information of great practical value.

MAX LEDERER.

PHYSICAL EDUCATION ACTIVITIES FOR HIGH SCHOOL GIRLS By the Staff of the Department of Physical Education for Women, University of Michigan, Ann Arbor, Michigan. Octavo of 322 pages Philadelphia, Lea and Febiger, 1928 Cloth, $3.50

This interesting and highly instructive volume offers a particularly excellent guide to instructors in physical training and camp administrators It is the work of a group of writers, and the thoroughness and attention to detail throughout the book bears out the wisdom of this plan. Each chapter is accompanied by a list of books and periodicals on its subject, together with information concerning the source of the materials required.

Several chapters, notably those devoted to canoeing, swimming, tennis and golf, will be of interest to teachers of young folks of both sexes The book is well written and clearly printed, and can be recommended to the reader as an outstanding achievement in its field.

JEROME WEISS

A TEXT-BOOK OF FRACTURES AND DISLOCATIONS Covering Their Pathology, Diagnosis and Treatment. By KELLOGG SPEED, S B., M D Second Edition Octavo of 952 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, $11 00

This volume of 952 pages with 987 illustrations appears in its second edition having been thoroughly revised thus bringing it entirely up to date. It is unnecessary to specifically review the individual treatments of the various types of fractures and dislocations described therein Suffice it to say that every conceivable fracture and dislocation of every type and of every bone in the body is fully and carefully discussed The plan of the work has been somewhat changed in this second edition, namely, the preliminary chapters on "bone, pathology of fractures, and symptoms, signs, and diagnosis of fracture" have been omitted. These points are covered in the discussion of each bone as it appears in the text.

Special consideration is given to the treatment of compound fractures because of their increasing numbers due to industrial and automobile injuries It is noteworthy that the author has avoided encumbering the text with the untried and unproven fads of treatment.

As a text book for the student of surgery, as a guide to the general practitioner and as a work of reference for the surgeon this book is highly recommended.

MERRILL N FOOTE.

A TEXT-BOOK OF PHARMACOLOGY AND THERAPEUTICS or the Action of Drugs in Health and Disease. By ARTHUR R. CUSHNY, M.A, M D Ninth Edition, revised by C W EDMUNDS, A.B., M.D, and J A. GUNN, M.A., M D Octavo of 743 pages, illustrated. Philadelphia, Lea & Febiger, 1928 Cloth, $6 00

This ninth edition of Dr Cushny's well known book has been revised by Drs Edmunds and Gunn to bring it into line with the present Pharmacopoeia Under such qualified supervision Cushny's work maintains the status that it has long enjoyed—easily the leader in its field.

M F DEL

BACTERIOLOGY GENERAL, PATHOLOGICAL AND INTESTINAL. By ARTHUR ISAAC KENDALL, B S., Ph D Third Edition Octavo of 733 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, $7 00

There are several important features in this edition which add to the splendid reputation which the book already enjoys as a text book of Bacteriology Kahn himself contributes a section on the Kahn test, giving a full description of the preparation of the antigen and the apparatus as well as the reagents to be used, both for blood and spinal fluid analysis, qualitatively and quantitatively The results of the tests as well as the comparison with the Wassermann test are also discussed.

The author also presents enlightening information on the mooted questions regarding the etiology of such diseases as poliomyelitis, typhus fever, and some of the exanthemata. One finds there a careful review of the more important and recent work on the Filterable Viruses, the Bacteriophage and Rickettsia

S H. POLAYES

DISEASES OF THE EAR, NOSE AND THROAT Medical and Surgical. By WENDELL CHRISTOPHER PHILLIPS, M.D Seventh revised Edition. Octavo of 922 pages, illustrated Philadelphia, F A. Davis Company, 1928 Cloth, $9 00

This, the latest edition of Dr Phillips' book on Ear, Nose and Throat contains additions of value and makes it the most up to date of any of the text-books on the subject. Chief among the additions are a revision of the chapter on test for hearing, including all phases of the audiometer tests the limitations of the so-called historical functional tests, an entirely new chapter, "The hearing problem" Recent studies of the mastoiditis of infants, the actinic ray in otology, improvements in the submucous resection operation, and also to be noted are the addition of 38 new cuts illustrating bronchoscopy and esophagoscopy, in this latest edition.

OUR NEIGHBORS

ANNUAL REGISTRATION OF PHYSICIANS IN TEXAS

The physicians of Texas are planning a bill for the annual registration of physicians modelled after the law of New York State The following abstracts from an editorial in the December *Texas State Journal* of Medicine give the general plan of the bill—*Editor's note*

The legislative committee of the State Medical Association has prepared, as per instructions of the House of Delegates, a measure which if enacted into law will place in operation the plan of annual registration of practicing physicians, as per the discussion which has been in progress in our midst for the past several years

Under this measure, all persons engaged in the practice of medicine in this state, as defined in the present Medical Practice Act, will be required to register with the State Board of Medical Examiners by the first of January of each year, and pay a registration fee of $2 00

If any person required to register fails to do so within sixty days, his license to practice medicine in the State of Texas stands forfeited, and he cannot continue in the practice of medicine until he has registered Should he continue to practice in the face of his failure to so register, he may be prosecuted under the Medical Practice Act, for practicing medicine without authority of law However, it is definitely and affirmatively provided that the forfeited license shall be restored immediately upon the filing of the registration blank and payment of the accumulated fees, plus an additional fee of $1 00, the sum calculated as being necessary to pay the additional expense of collection It will be noted that there is here no jeopardy of the right of any physician to continue to practice medicine in this state, once he has been extended that right and the same never having been cancelled by due process of law

All funds resulting from the collection of the registration fees, are placed in the state treasury, subject to voucher by the State Board of Medical Examiners, under regulations anticipated by the measure and compiled by the State Board of Medical Examiners This money may be used in paying the salary of a permanent secretary for the board, and for the maintenance of a central office, with the necessary inspectors, legal service and the like, incident to the enforcement of the law and its administration in general The fees coming to the board as the result of its activities in examining and licensing physicians, will continue to go to its members, as heretofore, as their compensation, the necessary expenses of administering that part of the operation of the law having been taken from the amount thus received before the distribution of the balance

The legislative committee did not deem it feasible to predicate prosecution for practicing medicine without a licence, on failure to register under this measure, should it become a law Prosecutions will, as heretofore, be based on the Medical Practice Act The only connection between the two would be that the right to practice medicine under the Medical Practice Act stands temporarily suspended when a physician fails to register annually He can cure such discrepancy at any moment by registering, which must stop any prosecution incident to failure to thus register

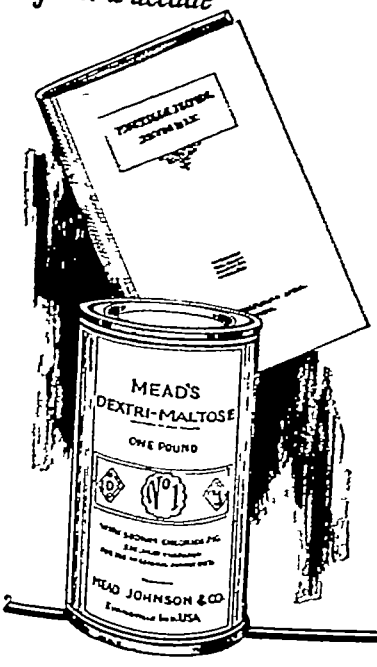
Manifestly, if any physician who has thus failed to register has no right to practice medicine under the Medical Practice Act, registering will not extend to him that right In fact, the measure specifically so states It is felt that the two laws have been coordinated in this respect with absolute safety to the physician who is legally practicing medicine It is also felt that an additional law, such as this, will make the Medical Practice Act more readily enforcible and more easily administered Certainly there will be an established, accepted state agency for the enforcement of the Medical Practice Act, and with the power and the means to succeed in its endeavors

LEGISLATION IN COLORADO

Colorado, as well as New York, has its legislation problems The February issue of *Colorado Medicine* discusses legislation editorially, and says

"The Twenty-seventh General Assembly of Colorado is now in session What this body of lawmakers does is a matter of concern to every citizen of the state What laws it may pass or amend touching matters of health and medical practice, is of particular concern to physicians If this concern is born of selfishness—a desire for class legislation—it should 'die a-borning', but if it springs from that altruism which has so characterized the medical profession of the past, it deserves the most considerate attention on the part of our legislators

"A bill has been presented providing for a separate Board of Chiropractic Examiners for licensing chiropractors Among other things the



(*Continued on page* 361)

CELIAC DISEASE

"A non-laxative combination of dextrin and maltose is best adapted because it can be given in such large amounts as necessary to cover the caloric needs without producing fermentation, diarrhea and intoxication."

MEAD'S DEXTRI-MALTOSE

From Text Books of over a decade

WHILE celiac disease is met only occasionally in infant feeding, its stubborn resistance to treatment is well known

This disease alternates between constipation and diarrhea, accompanied by intermittent vomiting, caused by a low acidity of the stomach

The stools are characteristic of this particular type of indigestion, large, foul and bulky from undigested fat

There is a marked intolerance for fats and, to a lesser extent, for carbohydrates

Treatment then lies in the correction of the diet The amount of fat must be lessened and the carbohydrate increased to make up this deficiency

Mead's Dextri-Maltose is the indication in such cases because of its easier assimilation in cases of weakened digestive powers

Because of its greater assimilation limits, it is used liberally by infant feeders in the case of well infants This, because it offers the greatest insurance against the appearance of digestive disturbances

THE MEAD POLICY

Mead's infant diet materials are advertised only to physicians No feeding directions accompany trade packages Information in regard to feeding is supplied to the mother by written instructions from her doctor, who changes the feedings from time to time to meet the nutritional requirements of the growing infant Literature furnished only to physicians

MEAD JOHNSON & COMPANY

EVANSVILLE, INDIANA

More Convenient— More Economical— Greater Therapeutic Range

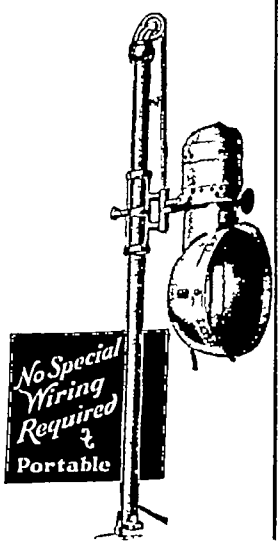
DISTINCTIVE features make the new Battle Creek Super Solar Arc Lamp noteworthy for its safety, efficiency, economy and broad therapeutic range The automatic magnetic feeding of the carbons insures the largest arc possible with the given current The current is perfectly utilized, and the use of 12-inch carbons minimizes loss of time and delay

Ease of adjustment to any desired position and the means of locking the lamp in place make this appliance most satisfactory for general use Power is variable in the Super Solar Arc The rays may be concentrated to produce caustic effects, or toned down to reproduce mild sunlight The combination of ultra-violet, infra-red and other light rays produces a spectrum that most nearly approaches that of natural sunlight

Solar erythema can be produced with the Battle Creek Super Solar Arc in six to eight minutes, when desirable Occupying a minimum of space, due to its upright position, the lamp may be easily and quickly moved in adjustment to the patient

The new Super Solar Arc Lamp employs many advanced features in construction May we send you our new bulletin, completely describing this efficient appliance?

Sanitarium & Hospital Equipment Co.
Battle Creek Michigan



Battle Creek Therapeutic Appliances *include.*

The Battle Creek Mechanical Health Horse
A valuable aid in the treatment of chronic conditions Provides exercise identical with horse-back riding, so frequently prescribed by physicians for health promotion.

The Battle Creek Massage Table—Type R I
Constructed of angle steel frame, welded together, finished in white asepuc enamel throughout, measuring 25½ inches wide, 80 inches long, and 30 inches high

The Battle Creek Radiantor
A portable electric light bath of great convenience to the general practitioner as it may be transported to any home, where the necessary electrical connections may be easily made

The Battle Creek Solarc Bath—Type BB
A very efficient apparatus for general body radiations of light, heat and ultra violet. Additional units may be added so that one lamp will radiate the adjacent sides of two tables.

(*Continued from page 358*)

bill redefines chiropractic as 'the science that teaches health in anatomic relation, and disease or abnormality in anatomic disrelation, and the art of restoring anatomic relation by a process of treatment as now or hereafter may be taught by leading chiropractic schools and colleges' Some latitude indeed!

"A bill has been proposed for the annual registration of physicians The proposed registration fee is five dollars Arguments for annual registration may be found in another part of this JOURNAL Other states have found it possible to execute the law on a much lower fee Why should we not profit by this experience, if indeed we want the law at all? The House of Delegates has more than once advocated this measure in principle, without consideration of the amount of fee This is a matter concerning which physicians should express their wishes to their legislators at once, as pressure for its passage or defeat or any modification of fee must come from physicians throughout the state There is no doubt that there is merit in the proposal, but it may be wise to postpone its passage or make the fee more nearly nominal

"Three other bills have been presented obviously of cultist inspiration. We are informed that one of these would make the vaccination of school children optional with the parent, another would prevent medical and dental examinations as authorized by certain school boards, still another aims its shaft at 'serums,' apparently intending to prevent the prophylactic use of toxin-antitoxin and anti-scarlet fever serum in schools as public health measures The supporters of these bills will undoubtedly masquerade under the much overused banner of personal liberty and throw up a smoke screen of the 'horrors of serum poisons' which do not exist

"There is great danger, however, that many of us will dismiss this pending legislation as none of our business But merely because we are better informed in these matters than any other group of citizens, a grave responsibility and an inescapable obligation exists not common to others If we fail to hold the torch of enlightened thought in things pertaining to health and disease by what light are our legislators to be guided?"

CULT LEGISLATION IN PENNSYLVANIA

The *Pennsylvania Medical Journal* for February devotes about 17 pages to medical legislation, most of which is on chiropractic licensure Pennsylvania is apparently going through the experience of New York State in 1926 when it secured the passage of the medical practice act which is now in successful operation

(*Continued on page 362—adv xviii*)

The Follow-Thru Of Your Instructions

THE physician who prescribes exercise for his patients is generally too busy to follow thru his instructions to see whether the prescription is being carried out—or neglected

The physician who takes the extra precaution of sending a client to McGovern's Gymnasium for exercise and re building has the assurance that his exercise prescription is being carried out to the letter, and that he can follow the progress of his patient by regular reports

A work out at McGovern's will show you why so many physicians send patients here. We'll be glad to send you a guest card.

CONSTIPATION

In the Breast-Fed Infant

HORLICK'S MALTED MILK has long been used with success in the prevention and correction of constipation among breast-fed infants

For the Nursing Mother—

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's—the Original—Malted Milk, knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby—

Supplementary feedings of "Horlick's" almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation.

(*Continued from page 361—adv xxii*)

The action of the New York Legislature in appointing a committee to investigate chiropractic in 1926 was parallelled by that of the Pennsylvania Legislature in May, 1927, providing for a Commission of ten persons "To study the Laws relating to the Healing Art," but what it did do was to consider ways of admitting chiropaths, naturopaths, and other cultists to practice without submitting to a course of study or examination An assenting report was signed by six members of the Committee, composed of a chiropractic, a naturopath, an osteopath, a laywoman who signed with reservations, and the chairman of the Public Health Committees of the two Houses of the Legislature

A dissenting report, upholding the ideals of the medical profession, was made by four members of the Committee, consisting of a regular physician, a Homeopath, an Eclectic, and a church official, the Right Rev John C Ward, of Erie, Pa

The *Pennsylvania Medical Journal*, page 345, gives the following figures regarding the number of practitioners in the state

Registered Physicians	12,000
Registered Drugless Therapists	118
Registered Physiotherapists	147
Registered Chiropodists	328

The State Societies have membership as follows

Medical Society of the State of Pennsylvania	7,832
Pennsylvania Homeopathic Society	1,200
Pennsylvania Eclectic Society	100

The number of licensed cultists is as follows

Drugless Therapists	236
Physiotherapists	681
Chiropodists	502

Regarding who practice "Drugless Therapy," the *Journal*, page 365, says

"The last group of chiropractors licensed under the state law were given the privilege of electing the type of special therapeutics they desired designated upon their licensing certificates All chose the words "drugless therapy" as covering a much more desirable and unlimited field than does the very small field of chiropractic."

The *Journal*, page 346, records the number of osteopaths as follows

"Under the Act of 1909, creating a State Board of Osteopathic Examiners, there are now about 700 licensees registered in this state"

It also states on page 364 that there are eight licensed osteopathic surgeons in Pennsylvania

The assenting, or majority, report of the Commission supported three bills which have been introduced in the Legislature. Senate Bill No 12 provides a commission composed largely of cultists to codify and revise the medical laws and

(*Continued on page 363—adv xix*)

(*Continued from page 362—adv xviii*)

lefine the practice of medicine (See the *Pennsylvania Journal*, page 363)

Senate Bill No 13 refers to osteopathic surgeons of whom there are only eight in the state

Senate Bill No 14 is long and provides for a sweeping licensing of practically all present chiropractors It contains the provision asked by the chiropractors of New York State, "Admit us to a monopoly of practice, and we will put up the bars so high that no more chiropractors can get a license."

STATE MEDICINE IN NEBRASKA

The February issue of the *Nebraska State Medical Journal*, page 89, has an editorial, evidently copied, which puts the plea for State Medicine in the best possible light as it says

"Here is our state of affairs, as a result of the privileges in a free country, of every patient to go to any sort of healer he chooses, and of every medical man to practice medicine according to his own ideas

1 Medical science is able to accomplish such wonders as the following

To prevent all but a very small percentage of infectious disease, deformity, insanity, mental deficiency, premature death, mortality in general,

To cure all manner of diseases and relieve most of the world's suffering and inefficiency

2 Yet, in spite of the fact that medical science *can* do these things, we find such things as the following

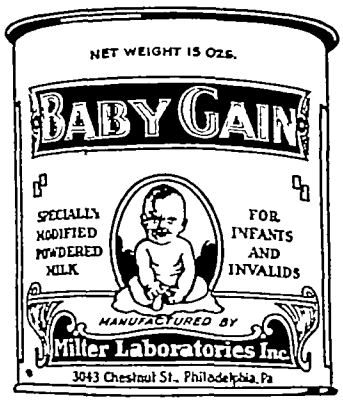
70,000 cases of smallpox per year,

300,000 cases of malaria every year,

11,000 deaths from diphtheria every year, and so forth with infectious diseases

30,000 babies born every year without a doctor in attendance

Unaccounted thousands of school children deformed and handicapped because they need tonsils and adenoids removed



An average length of life of 42 or 43 years, when it could easily be 60 or 70

Inefficiency and handicaps among laboring and business men due to remediable defects, which are not being remedied

Medical science is not being used for the benefit of humanity in general, it is merely being thrown about a bit at haphazard

3 Medical service is beginning to be so expensive that it is a burden to people of moderate means The yearly income of the medical man in this country averages not far from $1,000 (There are a few large incomes, but for every physician who makes $10,000 per year, there are ten who make less than $1,000)

(*Continued on page 364—adv xx*)

Pure Powdered Milk from Tuberculin Tested Cows

ADVANTAGES

The favorable results obtained with BABYGAIN in infant feeding are due to several factors

Keeping quality in any climate
Freedom from undesirable bacteria
Correct percentages of the needed nutritional elements
Low percentage of lactic acid
The Vitamins are preserved

The butterfat globules, by the spray process, are reduced in size and easier of digestion

The casein is broken up and forms tender flakes in the baby's stomach compared with the larger curds in raw milk

BABYGAIN has been extensively tested in hospitals and by physicians in their private practice, with highly satisfactory results

Samples and descriptive literature will be supplied to physicians upon request

MILTER LABORATORIES, Inc.

(*Continued from page 363—adv xix*)

It couldn't be worse, could it? The system doesn't accomplish much, it is too expensive to the patient, and yet it doesn't pay the doctor much

Suppose the fire-department were a private enterprise, and charged fees The bigger your fire, the more you have to pay for the service. If you can't afford to call them in, let it burn, and never mind what happens to the neighbors Medical service is certainly as important to the community as fire-fighting

"Medical care of the community is as much of a community problem as is education of children. Uncared-for personal health is as much of a public problem and a public responsibility as is an individual privately-owned house afire, or an individual uneducated child

"It is inconceivable that such glaring inadequacies and inconsistencies will be permitted to continue. Some remedy will be found for them. What it will be is mere conjecture Most of us consider that the political machinery can never handle the situation Political machinery has evolved two mechanisms of indubitable efficiency the fire-department and the post-office. Perhaps the United States Public Health Service can also be classed with them

"On the basis of what we know at present, 'State Medicine' will probably be administered by methods and under standardization quite analogous to that of the school district."

MEDICAL EXTENSION IN WISCONSIN

The Wisconsin State Medical Society conducts circuits in pediatrics, as reported in its *Journal* for February, which says

"Dean Snell reported that to date Dr Wayne Rupe had conducted two series of courses on the subject of pediatrics The first circuit was composed of the cities of Antigo, Marshfield Wausau, New London, Rhinelander and Stevens Point One hundred and one were registered in this circuit with an average percentage of attendance of 82 2 A second circuit included the cities of Beaver Dam, Janesville, Beloit, Watertown, Madison and Fond du Lac with 93 registered (percentage of attendance not as yet compiled)

"Dean Snell presented summaries of the questionnaire sent all who had taken the two courses in which it was indicated that the courses were meeting with enthusiastic approval of the membership"

Regarding the courses, the following questionnaire was sent out

(*Continued on page 365—adv xxi*)

(*Continued from page 364—adv xx*)

Where did you attend the course?

Were the lectures excellent, good, fair, passable, or poor?

Were the clinics excellent, good, fair, passable, or poor?

(a) What part or characteristic of the course do you consider the most valuable?
(b) Do you think a different apportionment of class time should be made? If so, how much time should be devoted to lecture, discussion, clinic?

If another course were to be given in your locality, what subject would you suggest?

What suggestions have you to offer for the improvement of this plan of postgraduate work?

The answers indicated that the courses were ighly satisfactory

Dr Wayne Rupe was offered a salary of $10,-00 to continue to conduct clinics and lectures n pediatrics A fee of five dollars will be harged for the course.

THE DELAWARE STATE JOURNAL

The Medical Society of Delaware has resumed he publication of its own monthly journal, which s called the *Delaware State Medical Journal* t had begun the publication of its own journal n 1910, and had continued it for thirteen years ntil it became merged with the *Pennsylvania ledical Journal* The two took the name *Atntic Medical Journal* The plan of the foundrs of the combined journal was that a single ournal should be developed by a merger of all he journals of the Middle States, for a feeling xisted that there were too many medical jourals But the combination never materialized n the meantime experience showed that many ounty medical societies of less than 100 memers could make a success of their own organs f publicity, and, therefore, the State of Dela-/are, with its 152 members, should be able to upport its own journal Delaware therefore reurrected its journal and began its new series ith the January issue, which says editorially

"Thus, in this year of grace, 1929, the Medical ociety of Delaware, with its hoary and honorble history dating back to its special Act of ncorporation in 1789, is perforce offering to its onstituents and friends once more Volume I, Number 1 We naturally hope for success and ong life, both scientific and economic"

WISCONSIN MEDICAL JOURNAL

The annual report of the secretary of the State Medical Society of Wisconsin, published on page 87 of the February *Journal*, shows an actual profit as is shown by the following table

FINANCIAL REPORT—1928

Receipts		
Advertising	$11,089 56	
Subscriptions	68 73	
C M A B refund and misc	458 76	
Total receipts		$11,637(
Publishing Cost		
Salaries	$ 2,321 44	
Printing	6,461 91	
Mailing	476 78	
Rent	395 00	
Discounts	1,171 40	
Cuts	162 94	
Miscellaneous	294 61	
Total cost		$11,284.(
Increase in net worth		$ 352.9

Commenting on the report, Secretary Crown hart says

"The financial report for the calendar yea past is submitted herewith Attention is calle to the fact that in 1923 the *Journal* cost th Society over and above all revenues received, th sum of $5,500 a year For the calendar yea of 1927 this was reduced to $1,500 a year Fo the calendar year of 1928, the *Journal* paid th Secretary-Managing Editor $100 a month a stipulated by the Council, paid salaries to a part time advertising solicitor, part-time salary of a stenographer, all publishing costs, and its jus portion of rent and yet the report shows a ne gain in assets of $352 97 without receiving a dollar from the State Society

"This has been accomplished without lowering the advertising standards, which are those of the *Journal of the American Medical Association* It is understood that this *Journal* is the only state journal to show an annual profit without support from its Society and maintaining the standards mentioned

"On the basis of this report, no financial aid is requested of the Society for the coming calendar year and henceforth all profits over a margin of safety will be re-invested in enlarging and bet tering the *Journal* itself

"It is of interest to note that through the financial savings in the *Journal* alone, the State Society has saved the entire cost of a full-time Secretary-Managing Editor"

HEALTH WORK OF IOWA WOMEN'S CLUBS

The health work of the Women's Clubs of owa is described in the January Journal of the owa State Medical Society as follows

"Every year we have presented resolutions o the federation, endorsing certain phases of ublic health work in which we were particuirly interested and we have tried to promote ese definite lines This year we have sponored the sale of Christmas Seals, yearly health xaminations, diphtheria immunization, and at ast one health program in every club

"In addition to these activities, we are tryng to arrange for a health survey to be made n two towns in each congressional district, me under 5,000 in population, the other over hat number In some sections of the state he plan is being carried on at present and the ounty medical associations can be of real serice in this undertaking The State Board of Health has been very helpful in giving aid

"The division of public health includes the ollowing subdivisions, community hygiene, ersonal hygiene, social hygiene, mental hygiene, public health nursing, occupational therapy, tuberculosis, narcotics, and vital statistics No club could devote sufficient time to study all of these subjects, but from reports sent to the chairman we feel that the entire division has received consideration along some line."

OREGON MEDICAL BLUE BOOK

The February issue of the *Oregon Medical Association* contains the following account of the Blue Book of the Society

"The Oregon State Medical Society has issued the first volume of its Medical Blue Book which, it is stated, will be published annually It is a paper covered volume of two hundred and forty-eight pages, containing all sorts of valuable information regarding medicine and the medical profession in the state The state society is featured with its constitution, by-laws, medical ethics and roster of officials Similar information is presented on the Oregon Public Health League, American Medical Association and special medical societies There is a summary of laws and regulations affecting physicians, including information concerning national and local boards of medical examiners State health laws and regulations are presented in full as well as Federal income tax laws and regulations The University of Oregon Medical School and the hospitals of the state are described The directory of physicians of the state includes an abstract of the life of each so far as available Every practitioner of Oregon will find a wealth of information in this volume concerning himself and his associates"

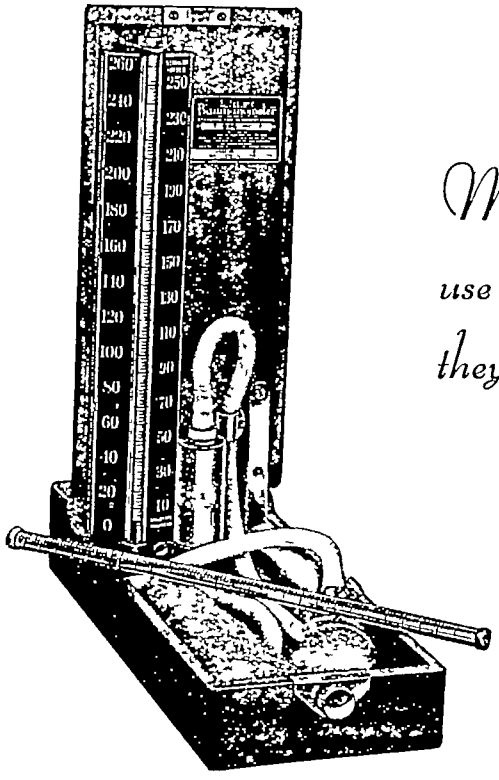
KENTUCKY PUBLIC HEALTH MANUAL

The *Kentucky Public Health Manual,* published by the State Board of Health, must afford practical reading, judging from the following extracts



"To each physician who is a member of the Kentucky State Medical Association, a copy of the *Public Health Manual* was mailed in October, 1928

"These Public Health Manuals, bound in a heavy blue paper and containing 390 pages, are valuable to the physicians and also to the citizens at large for use as reference to the Health Laws of Kentucky and the Rules and Regulations of the State and local boards of health

"Do you trade at a grade-A grocery store? See pages 265-267 and then examine your store to see if it measures up to grade-A How many hotels in your county are grade-A? See pages 288-298 and after examining your hotels you will have a better idea of what the travelling public thinks of your town, for tourists judge a community largely by the accommodations they have received at the hotel What assurance have you and your family while travelling on a rail road train, that the drinking water provided is safe to drink? See pages 303-304

"Do you know the source of infection, mode of transmission, incubation period, period of communicability and methods of control for the communicable diseases such as measles, typhoid fever, tularemia, whooping cough, etc.? These are all briefly given in alphabetical order on pages 144-185

"Included in this volume also, are other health laws, many of them copied in several states and with which each citizen should be familiar, together with the names of the members of the State Board of Health, a description of the several bureaus carrying on the detail work of making Kentucky the desirable state in which to live and its people the healthiest, happiest, long est lived"

DIPHTHERIA IMMUNIZATION IN VIRGINIA

What other states are doing in diphtheria immunization is of interest to physicians of New York State The *Virginia Medical Monthly* of December gives the following summary of the work done in that state

"Since the beginning of 1927 the Virginia State Board of Health has immunized 250,000 children against diphtheria In 1927 the State showed the lowest death rate from that disease in its history There was a reduction of 18 per cent in the number of cases and of 38 per cent in the number of deaths from the record of the previous year, although in the United States as a whole there was a general increase in the incidence of the disease Clinics for immunizing the children were held in the rural schools, local physicians and the state department of education cooperating with the staff of the board of health, to which additional physicians and nurses and a publicity agent had been appointed to carry out the campaign

"The board of health is also carrying out a general health campaign among school children, largely through arousing interest in winning the 'five-point' certificates which it issues to every child who comes up to the board's standard in regard to teeth, weight, sight, hearing, tonsils and adenoids One county has increased its number of five-pointers from 200 to more than 900 in a single year, and another has more than 2,400 The state employs ten dentists who travel about among the rural schools with portable equipment, charging a nominal sum for their work The state society of throat specialists has planned for the holding of tonsil clinics, and county nurses give much aid Teachers are now required to qualify themselves for the physical inspection of their pupils and, according to the supervisor of school dentistry, they usually discover about 65 per cent of the teeth defects, which, he says, is 'a whole lot better than nothing'"

Dr. Barnes Sanitarium

STAMFORD, CONN

A Private Sanitarium for Mental and Nervous Diseases. Also Cases of General Invalidism. Cases of Alcoholism and Drug Addiction Accepted

A modern institution of detached buildings situated in a beautiful park of fifty acres, commanding superb views of Long Island Sound and surrounding hill country Completely equipped for scientific treatment and special attention needed in each individual case. Fifty minutes from New York City Frequent train service.

For terms and booklet address
F H. BARNES, M.D., Med. Supt.
Telephone, 1867 Stamford, Conn.

RiverCrest Sanitarium

Astoria, L. I., Queens Borough
N Y. City
Under State License

WM ELLIOTT DOLD, M.D, *Physician in Charge*
FOR NERVOUS AND MENTAL DISEASES

including *committed and voluntary patients, alcoholic and narcotic habitues* A Homelike private retreat, overlooking the city Located in a beautiful park. Thorough classification. Easily accessible via Interboro B.M.T and Second Ave L. Complete hydrotherapy (Baruch) Electricity Massage, Amusements, Arts and Crafts Shop, etc.

Attractive Villa for Special Cases
Moderate Rates

New York City Office, 666 Madison Ave. corner of 61st Street; hours 3 to 4 P M. Telephone Regent 7140 " Sanitarium Tel.: "Astoria 0620 "
By Interborough, B.M.T, and Second Avenue L

HELEN J ROGERS, M D

DR. ROGERS' HOSPITAL

Under State License

345 Edgecombe Ave. at 150th St., N Y. C.

Mental and Neurological cases received on voluntary application and commitment. Treatment also given for Alcoholism and Drug Addiction. Conveniently located. Physicians may visit and cooperate in the care of their patients.

Telephone, EDGecombe 4801

BRIGHAM HALL HOSPITAL

Canandaigua, N Y.

A Private Hospital for Mental and Nervous Diseases

Licensed by the
New York State Hospital Commission

Founded in 1855

Beautifully located in the historic Lake Region of Central New York Classification, special attention and individual care.

Physician in charge,
Robert G. Cook, M.D

ROSS SANITARIUM, Inc.

Brentwood, L I., N Y
Telephone, Brentwood 55

The Ross Sanitarium is for convalescents, the aged, chronic invalidism, and for those needing rest and relaxation Resident medical and nursing staff. The Sanitarium is homelike, with close attention to diet and comfort of the patient. The number is limited, thereby making it possible for the medical and nursing staff to give individual attention Physicians sending patients may direct their management and treatment. Rates $35 to $100 per week. Established 32 years.

W H ROSS, M D., Medical Director

HOMES

For convalescents or those who wish a more permanent establishment. Fully equipped, nursing and domestic service

THE MEDICAL RADIO IN KENTUCKY

The use of the radio to diffuse medical information is becoming widespread The February issue of the *Kentucky Medical Journal* has the following editorial on the entrance of the Kentucky State Board of Health into the broadcasting field

"Through the courtesy of the *Courier-Journal* and the Louisville *Times*, the facilities of their national broadcasting station, W-H-A-S, have been extended to the State Board of Health for the purpose of broadcasting public health education The hour assigned, Tuesday afternoons at five o'clock, has been so arranged as to talk to the household, as it begins its evening assemblages

"The people of Kentucky have entrusted their public health affairs to the control of the medical profession Its new responsibility will be accepted by the State Board of Health with a sense of fidelity to the profession and its public interest. It must always be realized that the practicing physician has the most potent influence in the advancement of public health The doctors of the various bureaus of the Board will explain their work and organizations so that everybody may understand them

"The Journal suggests to the readers that they tell their patients about this hour and urge them to tune in for these health conferences"

RABIES TREATMENT IN MEDICINE

Indiana evidently gives antirabies treatment free, provided the patient goes to the State Capitol for it The *Journal of the Indiana State Medical Association* for March discusses this subject editorially as follows

"Again we have a complaint concerning the treatment of rabies cases by the State Board of Health, and calling attention to the inconsistency of compelling these cases to go to Indianapolis where the treatment is administered gratuitously, whether the patient is poor or not, and the patient is kept under observation at a large expense which must be borne through taxation It is pointed out that anti-rabic treatment can be given by any fairly well-trained physician, so why should it be necessary to refer all cases to Indianapolis? We are pleased to learn that a bill to correct this practice has been introduced in the present legislature"

Poland Water

is not only a benign diuretic, but its Amylolytic properties make it helpful in cases of amylaceous dyspepsia

A LUCRATIVE PRACTICE WANTED

The news department of the February issue of the *Journal of the Tennessee State Medical Association* says

"We quote a portion of a letter recently referred to this office If anyone knows of a location meeting the requirements, kindly let us know, so that we can communicate with the writer

"'I am a native of Tennessee and am anxious to come back. I am willing to do country practice, if I am in a good territory and can earn $7,000 or $8,000 per year'"

A country town supporting a $7,000 medical practice would be a health resort and not a rural community

TENNESSEE ANNUAL MEETING

The February issue of the *Journal of the Tennessee State Medical Association* in an editorial on the annual meeting says

"The night program will consist of the address of the President, Dr K. S Howlett. Also an address by the President of the American Medical Association, Dr W S Thayer, and the showing of a motion picture film, 'The Diagnosis and Treatment of Infections of the Hand'

"The committee on arrangements is actively at work It may be that the only trouble with the entertainment committee will be that of furnishing so much entertainment that the scientific sessions may be interfered with"

DIABETIC DIET READJUSTMENTS

Some foods cannot be allowed in diabetic diet at all and others only sparingly This means a readjustment in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar-free foods looks and tastes like the food that it replaces in the diet With the variety of foods, possible through the use of Lister's Flour, the patient is satisfied There is no temptation to "cheat" and the case is the better kept under control Some of the Lister foods are

Bread, Biscuits, Cheese Biscuits, Lunch Biscuits, Drop Cakes, Cookies, Spice Cake, Charlotte Russe, Lady Fingers, Bread Pudding, "White" Bread, Nut Bread, Spiced Bread, Gold Cake, Pie Crust, Pie Fillings, Filled Doughnuts, Meringue, Muffins, Pancakes, Waffles, Salmon Croquettes, Fried Noodles, Fluff Cakes, Breadsticks, Doughnuts, French Toast, Spiced Muffins —Advertising page i—*Adv*

INFANT FEEDING

Butterfat is the only fat in breast milk At the University of Oregon Medical School, dietary studies have proven that vegetable fats have not the growth-promoting and health-giving value of butterfat (Archives of Pediatrics, August, 1927)

All the fat in BABYGAIN—as in mother's milk—is butterfat. In the process of manufacture the fat globules of cow's milk have been reduced in size to conform with human milk and to attain the same easy digestibility The caloric value of butterfat is more than twice that of equal amounts of carbohydrates and proteins, which emphasizes its nutritional importance

The increasing demand for BABYGAIN proves the favor it is finding with physicians We often learn of satisfactory results obtained even in difficult feeding cases

Correctly modified to conform with mother's milk, BABYGAIN is as easily assimilated and digested Its basis is highest grade fresh milk from healthy cows

Free samples and literature will gladly be mailed to physicians on request— See advertisement, page xix. —*Adv*

CALIDAIR

A modern treatment giving prompt relief in coryza, bronchitis, laryngitis, hay fever and asthma, promoting unbroken sleep Sold to the public on prescription only New York State Distributors The Jeffrey Fell Co, 318 Pearl Street, Buffalo, George Tiemann & Co, 107 East 28th St., New York. WHAT EVERY MEMBER OF MEDICAL, DENTAL, AND NURSING PROFESSIONS SHOULD KNOW ABOUT CANCER, SO THEY CAN BEST AID IN ITS CONTROL*

By JOSEPH COLT BLOODGOOD, M D., BALTIMORE, MD

WHEN the surgical treatment of cancer had reached its greatest development more than a quarter of a century ago, the actual cures at the end of five years were less than ten per cent. The introduction of the *x*-rays and radium in conjunction with surgery, or as the sole therapeutic agents, has added very little to the per cent of five-year cures, except in cancer of the cervix, and here radiation accomplishes the results without surgical aid

It is quite true that the development of surgical art and science made the cure of some forms of cancer possible Before the operative treatment of cancer was established, cancer was practically a hopeless disease

The best surgery in late cancer can offer at the most twenty per cent of five-year cures, but in every hundred cases of late cancer, among unenlightened individuals, at least one-half are hopeless, so that the actual five-year cures are but ten per cent. The chances of a cure in the operable groups are about twenty per cent, because in eighty per cent of the apparently operable cases there are already internal metastases, or the cancer cell has infiltrated beyond the possible zone of operation This infiltration cannot be recognized with the naked eye at the time of operation and has rarely been studied with the microscope

The proof of this is the large per cent of local recurrences in the operative scar We must always look upon local recurrence as a sign of late cancer, or the result of incomplete operation

We have no evidence that improvement in surgical technique, or the introduction of cauteries, or electric operating needles, or electric coagulation will increase the per cent of operative cures of cancer Nor is there any evidence as yet that further development in the wonderful and powerful therapeutic agents *x*-rays and radium will increase the cures of cancer

Fortunately we have ample evidence that the five-year cures of cancer in any locality in which the local removal has effected a cure, can be increased from less than ten to more than sixty per cent

We also have proof that cancer of the mouth and skin and probably cancer of the uterus, can be placed in the group of preventable diseases

This control of cancer can be accomplished through education All the people need correct information, and this teaching must begin with children in the primary schools and continue into adult life Members of the medical, dental and nursing professions must receive specific instruction not only in the years preceding their graduation, but continuously after the beginning of their professional career In addition to this educational problem of getting known facts in regard to cancer to the children in the public schools and the adult population, and further special information to the members of the three professions, there must be a constant endeavor to develop and improve an organization which has for its object the control of cancer as well as the control of all controllable diseases

In spite of the fact that cancer of the skin, mouth and cervix may be made preventable diseases and in spite of the fact that all types of cancers that have been cured by local removal may have their cures increased from ten to sixty per cent, there will still be almost thirty to forty per cent of cancer hopeless from its onset This demonstrates that the ultimate cure of all cancers rests upon successful research for the cause, the prevention and the cure

This discovery by research of the cause, prevention and cure has been accomplished in some diseases, such as diphtheria, so that it is theoretically possible in all disease

* Read by invitation at the Twenty ninth Annual Meeting of the Lake Keuka Medical and Surgical Association, at Keuka, N Y, July 12th and 13th, 1928.

Inadequate and apparently bungling as our efforts towards the control of cancer have been, there is no question that favorable results have been accomplished in all civilized countries, and perhaps most in some localities of the United States

The records of the Surgical Pathological Laboratory of the Johns Hopkins Hospital show that previous to 1900 we rarely saw a precancerous lesion In each locality cancer was eighty per cent and benign lesions twenty per cent Of the cancers over fifty per cent were hopeless and less than twenty per cent living after five years These figures varied with cancers in different localizations Since 1920 precancerous lesions in some localities are reaching sixty per cent, benign lesions as compared with definite cancer eighty to twenty, reversing the former figures of twenty to eighty per cent Of the cancers less than ten per cent are hopeless, and after five years more than sixty per cent are apparently free from disease

I have reported these figures in my paper before the Mohonk Lake Cancer Convention of the American Society for the Control of Cancer These papers have been published in *Surgery, Gynecology and Obstetrics* and, in book form, by the American Society for the Control of Cancer

I do not propose, in this paper, to discuss in detail the organized attack for the control of cancer which is a problem in education, but simply state that the improvement in the cancer situation in the past ten years is entirely due to the enlightenment of the public through the public press and the teaching of the members of the three professions by articles in the medical journals and cancer clinics The American Medical Association, the American College of Surgeons, the American Society for the Control of Cancer, the American Society for Cancer Research, national, state, county, city and other societies of the three professions are gradually coming together in an organized effort to educate and enlighten the people and to make the members of the three professions more expert in earlier recognition and better trained in special treatment of the local lesions which precede cancer, and cancer in its early stages

It is my chief purpose today to bring before you, with lantern-slide illustrations, some very practical statements in regard to cancer in various localities which I think will be helpful to you in dealing with your own patients, and, in addition, will be helpful to you to realize the importance of an organized attack along educational lines, and the equal importance of an organized effort to raise more funds for research

Cancer of the Stomach and Colon, Including the Rectum—In the first place, both, the public and the members of the professions, must know that resection of large portions of the stomach, colon, or rectum have been done with very little mortality and have accomplished cures of cancer more than twenty-five years ago Every great clinic of the world has cases to prove this The failure to cure cancer of the stomach, colon and rectum is largely due to late intervention In only a small per cent of the cases do the cancer cells break away early from the local growth in the walls of the gut and infiltrate the mesentery glands and adjacent viscera, thus making local removal impossible. In only a very small per cent of the cases do the cancer cells get into the blood or lymph stream and metastasize while the local growth is still operable

The hopelessness of cancer of the stomach, colon or rectum today, although it has been greatly reduced by the educational effort and increase of knowledge, is still too large, because the public is ignorant of the significance of simple indigestion, belching of gas, the sensation of gas distention, unexplained constipation and diarrhoea They either put up with these discomforts, or treat them themselves and do not consult a doctor until too late. Or, if they do seek help from a member of the medical profession, they are apt to get treatment rather than an examination Every human being should know from childhood on that any message of discomfort in the region called the abdomen or belly, may be a message of warning and every message requires an immediate answer Children should be taught to report to their parents or teachers, and adults should know that that is the time to consult the doctor

We have had for a number of years an instrument of precision which rarely fails to detect the filling defect due to a cancer of the stomach or colon For cancer of the rectum we have the surgeon's greatest instrument of precision—the finger, and we now have the proctoscope which lights up for our inspection a zone far above that which can be reached by the finger—into the sigmoid colon In spite of these accurate methods of detecting cancer in the curable stage, the per cent of hopeless cases recorded in the clinic is far too great. Of the last 500 cases in the Mayo clinic, Dr Balfour writes me, more than sixty per cent were inoperable In 1915, when I studied and reported all the stomach cases recorded in the laboratory at Johns Hopkins, almost ninety per cent arrived in the clinic in the inoperable and hopeless state The majority of people today who suspect that they have heart disease ask the doctor to examine the heart when they visit his office the first time, but very

ew people with indigestion ask for an *x*-ray xamination—they ask for relief by medicine

There is much to be done in enlightening he public and the profession on these matters f preventive medicine, and the life-saving value f the earlier recognition of disease

For example, every child should be taught his If it has any kind of pain in the stomach, t should report immediately to the teacher in school and be sent home, and this child should say to its mother or nurse "I have a pain in my stomach Don't give me any water or food, don't give me a cathartic and, please, don't make me take castor oil Just put an ice cap on my abdomen and send for a doctor" This must be taught every child, just as it must be taught to read, write and the multiplication table. If anyone dies of appendicitis today, someone has blundered, either because the child has not complained to the teacher, nurse or mother, or, there was some delay in sending for the doctor, or the doctor or surgeons delayed As a matter of fact there are very few deaths from appendicitis today and, as a rule, the delay is before the doctor sees the patient Three days ago I saw a young boy dying of peritonitis Yet, he had been operated upon twelve hours after his first pain The doctor had not been sent for until the tenth hour, although there was enough pain to justify calling the physician in the first hour But, because the pain got better, the mother gave her son castor oil and delayed informing her physician until peritonitis had set in The blunder of an uninformed mother was responsible for the death of her son

The probabilities are we can not cure every case of cancer of the stomach, colon or rectum, even when the patient, the physician and the surgeon are correctly informed and act instantly and properly, but the per cent of cures should be increased from less than ten to much more than sixty per cent

In spite of the fact that *x*-rays have been here for many years and that we have become very proficient in the recognition, from the *x*-ray and fluoroscope examinations, of lesions within the abdomen, this so-called gastro-intestinal study is usually postponed The patients wait, because they are not sick enough, and often the family physicians delay justifying the delay by the expense of the *x*-ray study But this can not be entirely true, because there is the same delay by the group of physicians who put off the *x*-ray examination because of expense, in the rectal examination with the finger which is not expensive In our organized educational effort, as we urge upon the entire medical profession that examination with the *x*-rays, proctoscope and finger should precede any treatment, we must also endeavor to so enlighten the people that they will demand a thorough examination first

We have had a long experience with resection of the stomach, colon and rectum The majority of experienced surgeons are returning to the Billroth I method of suture in which the duodenum is sutured to the open end of the stomach and the remaining opening closed There is only one contraindication to this suture, and that is, tension Studies of stomachs resected for cancer have shown that most surgeons give the cancer too much margin of healthy tissue on the stomach side Those who have learned to restrict this margin well within the lines of safety are more frequently able to restore the continuity of the resected stomach by an end-to-end gastroduodenostomy as first devised and performed by Billroth of Vienna in 1884 When this is impossible, experience has taught us not to perform a short-loop posterior enterogastroenterostomy of the modern type, but to return to Billroth's original second method in which the loop was long and anterior The more recent method devised by Polya seems a better method than the original Billroth II The patients who survive resection of the stomach for cancer or ulcer have practically no complications The choice of the method of suture after resection has been influenced by immediate mortality and complications, and here the Billroth I or the long-loop gastroenterostomy of the Polya type have apparently taken first place

In my own experience, there has been a definite change for the better in the past two years The per cent of inoperability in my clinic is less than twenty I have been able to resect the cancer in the majority of cases, and even when almost the entire stomach had to be removed, I have learned by mobilization of the duodenum to restore continuity by the Billroth I method I prefer blood transfusion to operations in two stages Blood transfusion has practically eliminated death from shock Billroth I and Polya have entirely eliminated death from duodenal dilatation The only danger is due to peritonitis from faulty suture, and this danger is only present when the resection on the anterior curvature extends almost to the diaphragm, and resections of this kind are only done to make a cancer patient more comfortable In a favorable case of cancer of the stomach practically the only dangers of operation are due to pneumonia and embolism—dangers common to all laparotomies

The greatest improvement in postoperative care is the introduction of a feeding tube through the nose into the duodenum after the Billroth I, or into the upper loop of intestine after a Polya

My records show that it is a mistake to

judge a case of cancer of the stomach inoperable from the *x-ray* picture only, or from palpation of the mass in the stomach I have a patient living now two years since resection The condition was diagnosed inoperable from the *x*-ray picture, and from palpation of the mass filling the epigastrium It proved to be a large colloid cancer of the stomach, freely movable, without adhesions

Fluid in the abdomen, nodules in the abdominal wall and a nodular liver are associated with hopless cancer, but the liver may be enlarged and yet not involved in the cancer

I am inclined to exploration in most cases, even when the evidence favors inoperability This can be done under local anesthesia In fact, resection is often possible without general anesthesia

The outlook for cancer of the stomach is undoubtedly improving I am convinced that when the patient is thoroughly studied, we will rarely overlook the cancer of the stomach, colon or rectum Fortunately, the most common lesion producing gastric symptoms which has no relation to cancer of the stomach, is duodenal ulcer, and there is no difficulty whatever in the *x*-ray film and the fluoroscope picture to differentiate gastric filling defects with possibilities of malignancy from defects on the duodenal side of the pylorus which practically rule out cancer of the stomach

Cancer of the Colon—A historical review of the facts here reveal the human element and gives us information of how we must proceed in order to control cancer through an educational effort Before 1900, in the Johns Hopkins Clinic, the only cancers of the colon which we were able to resect and among which there have been some cures of more than twenty-eight years' duration, were cancers of the sigmoid colon, because, in a certain per cent of cases, obstruction forced the patient to seek surgical aid immediately Little or no attention had been paid to the symptoms which preceded the obstruction, although they are recorded in practically all the histories Not until 1911 did a case of cancer of the right colon come for operation in the operable stage This patient is living seventeen years after resection of the right colon with ileo-colostomy In recent years the per cent of operable cases has tremendously increased, and rarely do we see cancer of the colon with acute obstruction They seek advice because of intermittent colic, with and without belching or vomiting, vague discomforts hours after eating, visible distention of the lower abdomen, unexplained constipation or intermittent diarrhoea In the majority of cases the tumor is not palpable, nor is there visible peristalsis —signs frequently recorded in the older cases The position of the cancer producing the obstruction is found in the bismuth study with the fluoroscope and *x*-ray films, or with the proctoscope

There is no difficulty with resection and suture of the colon, except in the lower third of the sigmoid We have learned to overcome the difficulties when the cancer is in the transverse or splenic colon There are practically no complications after resection of the colon with proper suture. When lateral suture can be done, it is just as good as end-to-end Fortunately, we now know how to perform the end-to-end anastomosis without danger In some case this is an operation of necessity I am looking for a most remarkable improvement in cancer of the colon The per cent of inoperability will always be less than in the stomach. Cancer of the colon metastasizes later than cancer of the stomach, and must be present a longer interval before it infiltrates into the mesentery or involves adjacent tissues or organs

Benign Polypoid Tumors of the Stomach and Colon—Until recently these lesions were found only at autopsy in patients dying of other causes Now we are finding them in the stomach and colon when we operate for cancer because of a definite filling defect About four years ago I photographed a resected right colon and pictured a benign polypus near a malignant polypus Since then, in both the colon and the stomach, I have explored and removed the benign polypus which undoubtedly is a precancerous lesion Balfour's report on benign lesions of the stomach is a good sign that both, the people and the profession, are receiving and understanding the message of examination first, that this examination must be made quickly after the first warnings, and that the *x*-ray is the instrument of precision for searching out lesions of the abdominal cavity

Cancer of the Rectum and Lower Sigmoid—The rectal examination with the finger or the proctoscope must be inconvenient and distasteful to both, patient and doctor, because it is so frequently neglected when positively indicated. A protoscope is no more expensive than a stethescope It can be used on an ordinary battery and carried with the stethescope and blood-pressure apparatus in the physician's bag It is an instrument of precision available to every member of the medical profession and should be of common employment like the stethescope and clinical thermometer, because no longer is the examination of the rectum with the finger sufficient. Lesions that produce the same symptoms may be situated above the limits of exploration with the finger, but can be easily seen and felt with the long proctoscope.

In the Johns Hopkins Clinic, the first cancers of the alimentary tract, excluding the lower lip, to be cured, were situated in the lower rectum and completely exercised by the method of Kraske The names of Billroth for the stomach, Halsted for the breast, Kraske for the rectum, and Wertheim for the uterus, should be preserved and honored together, as of pioneers in the conception and execution of radical operations for malignant disease Surgeons familiar with the works of these men will never experience local recurrence because of the incompleteness of their operations I have a patient, over eighty years of age, alive at this writing, whose rectum I resected by the Kraske method more than thirty-two years ago

Colostomy—It is essential that the public should be properly informed about colostomy, and it is essential, if we wish to make the complete removal of the lower sigmoid and rectum popular, to learn how to make a cloostomy easier to care for than the normal anus This can be done Many surgeons today are of the opinion that, for cancer of the lower sigmoid and rectum, the operation of choice should be complete removal from a point above the cancer to the anus, and a proper colostomy of the remaining sigmoid It may be done in two stages, for which Coffey's method is most popular, or, with blood transfusion, it may be performed safely in one stage At the present moment the surgery of the lower third of the sigmoid and upper rectum remains the most difficult and dangerous abdominal operation I am inclined to think that blood transfusion will reduce most of the dangers of operative shock. It is my practice, in some cases, to explore and do a colostomy of the cecum first This allows preparation by cleansing of the entire colon and best prepares for the complete removal and left-sided colostomy in one stage

I am also of the opinion that there is still a place, especially in old and feeble people, for the complete resection when the cancer involves the anal region or lower rectum, when this is done without opening the peritoneal cavity and without removing more than the coccyx There is distinctly less shock and the sacral anus can be made almost as easy to care for as an upper sigmoid colostomy

I have gone into these details in regard to the surgery of the stomach, colon and rectum, because many members of the profession have little opportunity to learn of the tremendous advances that have been made, the slight risks of operative procedures, the tremendous improvement in colostomy We cannot expect to convince people until we convince the members of the medical profession who are not specializing in surgery

More space has been devoted to cancer of the stomach, colon and rectum, because neither the public nor the profession seem to be as familiar with the exact facts and the marvelous advancements as they are with cancer of the breast, uterus, mouth and skin At this time the largest per cent of inoperability of all forms of curable cancer is in cancer of the stomach, and next perhaps in cancer of the colon It is my opinion that when we have taught children in the primary schools what they must know for their protection against death from peritonitic after appendicitis, we will have much less difficulty in instructing them in regard to cancer of the stomach, colon and rectum

Cancer of Bone—I use the term in a general sense It is wise to employ the word cancer for all types of malignant disease and use carcinoma for the epithelial group and sarcoma for the connective-tissue group, and it is very convenient to reserve the word tumor to include both the benign and malignant, because when you tell a patient that he has a cancer, he knows that he has a malignant disease, but when he is told that he has a tumor it allows the fundamental hope that it may be benign Fortunately, today more people are seeking examination in the tumor stage, and in many instances only the microscope will distinguish between the benign and malignant, so we are perfectly justified in saying "You have a tumor" in emphasizing that it should be removed, because it might develop into cancer Such a statement is not only truthful, but, to the patient, quieting and encouraging

When I repored in the Journal of Radiology in March, 1921, just seven years ago,I had less than 400 bone tumors Of the 72 sarcomas of bone over 50 had been observed more than five years, and of these only 2 were living The per cent of cures, therefore, was more than two But this was better than cancer of the stomach, in which the per cent of cures was less than two It is to be emphasized again that this included inoperable cases These two patients are living today, but the five-year group has increased from two to almost forty, and the per cent is approaching thirty When Codman of Boston started his registry of sarcoma of bone, the committee, after some years study, was able to find about 14 cases which it would accept as sarcoma living five years after operation As yet the registrar has not made a second report, but I am confident that we will find improvements everywhere.

Now, let us look at it from the standpoint of amputation only Certainly it must be clear to everyone that if the cures of sarcoma of bone after amputation have increased, amputation cannot be credited with this improvement The microscope shows no difference in the pathology The facts are, that the dura-

tion of time, between the first symptom calling attenion to the involved bone and the first X-ray, is getting shorter every year, and the duration of time between the first *x*-ray and the amputation is getting shorter, in spite of the fact that some members of the medical profession choose radiation rather than amputation There seems to be but one conclusion to explain the increasing number of five-year cures after amputation for sarcoma—the shorter duration of the disease

The failure to cure sarcoma is not due to local recurrence after amputation, but to metastasis before amputation There may be another factor In former years, in a larger number of cases there was not only delay, but operative interference—explorations for osteomyelitis, non-indicated curettings, incisions for biopsy with a long delay before amputation The malignant tumor of the bone is smaller today, although palpable, there is rarely infiltration of the skin or surrounding muscle We now never see joint involvement when the tumor is near the joint, rarely much disturbance of function, and usually the patient does not use a cane or crutch The people are getting very enlightened in regard to the importance of *x*-rays when there is any pain, swelling or tenderness in the region of a bone or joint, or any limp, or interference with function So well educated are they getting to be that a doctor who suggests treatment without an *x*-ray examination loses the patient, nor will the patients put up with the diagnosis of "growing pains" for their children, nor with medicine for "rheumatism" Nor will they allow the removal of tonsils or the extraction of teeth before the involved area is studied with the *x*-rays It is really a very remarkable advancement and shows what education can do In the past few years osteopaths and chiropractors have ben sending their bone cases for an *x*-ray study before beginning their specific quack treatment Even the Christian Scientists, in my own experience, fear to experiment with mind over matter, if the matter is in the bone We must remember that we have been *x*-raying bones from the time that Roentgen discovered the *x*-rays and, in view of the tremendous importance of factors in industries, accident insurance and workmen's compensation, the importance of an immediate *x*-ray study after an injury to a bone or joint, was so broadcast to the public and the profession, that the results were shown when we began to educate the public and the profession on malignant disease of bone It is my opinion that this educational effort was greatly advanced by Codman's registry of sarcomas of bone

Without the aid of any discovery, or anything new, the publicity of the registration of bone tumors is so widespread, that it reaches not only the profession, but the public

We now know that it is a safe procedure to have an *x*-ray picture taken after every injury to bone or joint, even when there is no sign or suspicion of a fracture This *x* ray may reveal a fracture and lead to its immediate treatment It gives us an *x*-ray for future comparison should the symptoms not subside, or should they reappear after an interval of treatment I have seen in the *x* ray plates a giant-cell tumor develop after an injury These *x*-ray examinations reveal many healed latent injuries, such as tuberculosis, osteitis fibrosa, Paget's disease, rickets, chronic osteomyelitis, syphilis It has taught all of us to be on the alert

Now that patients are coming at once for *x*-rays, we are finding the diagnosis much more difficult There are many diseases of bone that are not malignant and many of these get well without operation Yet, it is often difficult to distinguish a latent healed lesion brought under observation by a recent trauma, a benign lesion due to trauma, from sarcoma in its incipiency following a trauma When the *x*-rays fail to differentiate, there must be biopsy

The entire medical profession requires correct information on biopsy in bone lesions

Biopsy in Bone Lesions—Unless the bone case is in a clinic where the biopsy can be done, properly interpreted and followed immediately by the indicated operation, it should not be done It is far better for the patient to submit the *x*-rays to more experienced diagnosticians before taking up the question of biopsy While waiting, the patient's limb can be kept at rest and deep *x*-ray therapy given If there must be a biopsy with an interval of time, in order to submit sections to pathologists of greater experience, the piece should be removed with the cautery, the wound should be cauterized with the thermo-cautery, and then packed with a piece of gauze which has been saturated with a fifty per cent zinc chlorid solution and squeezed almost dry The wound may then be closed In some instances a piece of gauze may be left in the wound The interval of time should be as short as possible With air-mail and the telegraph, it can be reduced to less than a week in this country One of the two cases living after five years which I reported in 1921 had a biopsy with an interval of time of two weeks Among the cases cured five years which have accumulated since then in a few there were biopsies

Routine Examinations for a Bone Lesion—In these early doubtful cases there should be an *x*-ray of the involved bone and its mate of the chest and the pelvis, of the teeth and sinuses There should be a Wassermann, and

if the lesion is periosteal, there should be given a provocative intravenous arsphenamin, the urine should be examined in the usual way and, in addition, a careful test made for Bence-Jones bodies Beside the usual blood count, there should be repeated total and differential leucocyte counts Again and again the involved bone and its mate should be palpated, the sinuses should be transilluminated and the region of the tonsils and nasopharynx studied Search should be made for a possible malignant tumor, and if there are any scars, the pathology of the tumor removed should be ascertained by telegraph In my own experience, the number of patients who were *x*-rayed in the incipiency or after a slight injury, has greatly increased, and cases difficult to diagnose are on a decided increase In view of the certainty of a Wassermann and the great improvement in the syphilitic clinic, we rarely see now syphilitic bone lesions difficult to diagnose, but latent healed osteomyelitis and chronic osteomyelitis have taken the place of syphilis in the early cases difficult to diagnose Ossifying periostitis always presents a dilemma The *x*-ray picture of bone formation, of traumatic, infectious, or neoplastic origin, is often identical, and only a biopsy will make the differentiation Then it requires one of unusual experience to differentiate the sarcoma cells by which the bone is invaded from inflammatory granulation tissue due to trauma or infection. It is for this reason that it is a good plan to give *x*-ray therapy while waiting *X*-ray plates can be sent by mail and a number of good opinions obtained very quickly

Since dictating this note on the routine examination for a bone lesion, I have just had an observation which indicates that an *x*-ray picture, lateral and antero-posterior, of the skull must be added to the routine procedure, and perhaps *x*-ray films of the teeth and sinuses The case also pictures the value of our educational efforts

This patient was president of the Board of Trustees of a hospital in Delaware, a contractor and a man of unusual intelligence He was apparently familiar with the correct information on preventive medicine and the importance of the earlier recognition of disease He had never observed anything wrong with his right tibia until less than two weeks ago, when he accidentally felt two bumps on the shin, one over the tubercle and one over the junction of the upper and middle third of the tibia The lower bump was tender He did not think he had rheumatism, and he knew the importance of an *x*-ray, because he went to the roentgenologist who took *x*-rays of the affected tibia and its mate and revealed a disease involving the upper half of the right tibia The blood was examined, the urine tested for Brence-Jones bodies, and a negative Wassermann recorded The case when brought to me by his physician had been completely studied, except there were no *x*-ray films of the pelvis chest and skull Not until we had before us the *x*-rays of the pelvis and the skull had we the positive evidence that the condition in the tibia was part of a general disease affecting the entire skeleton—Paget's osteitis deformans

The *x*-ray picture of the pelvis of a woman after an operation for a verified cancer of the breast was almost identical with the *x*-ray picture of the pelvis in this case of Paget's disease.

I emphasize this, because the earlier patients come for examination after the first warning the more difficult the diagnosis and the more complete and the more general must the examination be in order to arrive at least at a working conclusion which will lead to protective or curative treatment

As our experience grows with cases of this kind, we are forced to think more seriously of group medicine, of diagnostic clinics, even in the smaller communities and to formulate in our vision a better organization among the professions of medicine, dentistry and nursing for the control of disease through a systematic educational effort and through properly financed research

STERILITY*

By I. C RUBIN, M.D., F.A.C.S., NEW YORK, N. Y.

STERILITY has a unique place in medicine The problems involved are concerned not alone with one individual, but with two of opposite sex united in a fruitless marriage It is the mating that is sterile and therefore the biological and pathological factors of each partner which contribute towards it must be considered apart and collectively

Inquiring into the Causes of Sterility in the Female

The female who fails to get pregnant within say three years of married life should for her part receive the following examination In the clinical history it is well to inquire into the occurrence of scarlet fever, typhoid, pneumonia, especially of the influenza type, malaria, mumps and tuberculosis Malnutrition as a sequel of these diseases or independently of them, scurvy and rachitis are not only generally debilitating, but

* Read at the twenty ninth annual meeting of the Lake Keuka Medical and Surgical Association at Keuka, New York, July 12th and 13th 1928

are more especially a drain on the vitality of the ovaries and the other glands of internal secretion, especially upon the thyroid and adrenals Congenital syphilis and tubercular adenitis are also important etiological factors If these infectious diseases have been particularly virulent and if they happened to attack the individual in early youth they may be followed by retardation in general development or local development, or both

Development on the other hand may be defective congenitally and will be evidenced in general constitutional inferiority and infantilism, alone or combined with local anomalies Exceptionally, the latter may be found in individuals exhibiting every other trace of full development The anomalous condition will be more in the nature of a septate hymen or vagina, a uterus bicornus or duplex where the ovaries however have advanced to normal anatomical and functional evolution From any practical study of sterility, must at once be excluded those hopelessly abnormal cases of gynaplasia and the marked rudimentary type The latter may rarely acquire late maturity The cases associated with absence of genitals, pseudo hermaphrodites and true hermaphrodites belong to the relatively small group of anomalies where nature has failed of its accomplishment and hence seeks to terminate their kind, as it were, by depriving them of the reproductive faculty

Other factors that have an etiological bearing on sterility are late marriages and prolonged engagements The former because in general the nearer the menopause the less are the chances for impregnation, not only through quantitative reduction in available ova, but also by reason of the fact that with advancing age the individual's health does not as a rule improve The latter naturally holds alike for women and men Prolonged engagements are fraught with physical and psycho-sexual strain which experience has shown to exert an inhibitory effect on the reproductive capacity of the couple after marriage. The same may be said for those married couples who have practiced contraception for long periods! They find to their great surprise that nature does not respond to their call for a child Perverted genital secretions brought about by the artificial practices in some, chronic passive hypraemia and acute exaccerbatins in others, or both of these, combine to defeat the most ardent desire for offspring Instances are not rare where a second conception is rendered difficult by preventative methods being used after the first child is born

Masturbation when excessive and persistent may lead to sterility, in the male by psychastemia and impotence, and in the female by inducing menometrorrhagia, secondary to the microcystic disease of the ovaries Dyspareunia in its broadest sense may follow female onanism and undoubtedly acts as a deterrent to inpregnation

Deficient diet has been shown by Reynolds and Macomber to induce sterility in rats and other rodents, whereas feeding these animals rations containing adequate amount of vitamines restores the reproductive function. Experience in man is not nearly as simple, but the work and results of H Evans with vitamine "E" are suggestive

Profound psychic disturbance whether primary or secondary to somatic derangements offer a bad prognosis They are often associated by a temporary or more or less permanent amenorrhoea. Marked changes in the menstrual function, especially the metrorrhagias of puberty and adolescense and later, have a decided value in the clinical history They indicate both constitutional and local ovarian faults Obesity with and without amenorrhoea, from the extreme case with Frohlich's Syndrome to the milder grades, indicate faulty functional and probably also defective somatic development in which the glands, chiefly pituitary and thryoid are involved Frigidity while not often associated with general failure in development, nevertheless bespeaks psychic, emotional backwardness which may be based upon inadequate endocrine function at least as well as upon lack of education The individual with proper anatomical development requires very little sex stimulus to arouse sex desire

The mechanical factors involved in unsuccessful mating and residing in the woman are very readily determined, certainly external obstructions such as scars, burns, tumors which may in rare cases so deform the genital passage as to prevent male approach Obstruction of the uterus and tubes can now be definitely determined by peruterine tubal insufflation This method has enabled us to exclude mechanical obstructive factors and has therefore led us to focus our attention more upon chemical and physiological processes involved in fertility The only baneful sequel of a terminated appendicitis may be peritubal adhesions with tubal strictures or total occlusion

Of practical importance in sterility are those relatively minor local defects such as vaginal stenosis of milder or severer grade, shallow vaginal fornices and positional deviations of the cervix These conditions make it difficult for intromission and proper ejaculation of the semen into the cervical canal There is lack of mingling of cervical secretion with the semen and the latter is more apt to be subjected to the acid secretion of the vagina. The retroflexions and retroversions, the sinistro and dextro deviations fall under this category In retroflexion and retroversion there is still another factor namely an obstruction at the intramural and isthmic portion of the tubes which militates against ovular and spermatozoon migration. Utero-tubal insufflation can be utilized as a guide in the therapy The pin hole external os is also unfavorable for impregnation and for

the same reason These conditions are, however, amenable to corrective treatment

Fibroids exert a deleterious effect in a sheer mechanical way by blocking the cervical canal, uterine cavity and tubal ostiae, by causing hemorrhage in which however, the ovaries may play a primary etiologic role, and in the event of conception taking place, by not infrequently inducing abortion or causing dystocia Fibroids that do not produce these symptoms are compatible with conception and pregnancy carried to term These patients, however, require great care throughout their gravidity Surgical intervention before and during pregnancy, and during or after labor has been successful in meeting the difficulty

Inflammation of the external and internal genitalia disturb successful mating by perverting the normal secretions on the one hand and on the other by sealing up the passages completely or incompletely No matter where this inflammation may be located conditions obtain which are inimical to the spermatozoa or that render the sex act painful and incomplete. If the vaginal secretions in health do not particularly favor the activity of the spermatoza it is readily seen how much less favorable patholigic secretions of the vagina, cervix and tubes would be and actually are. The mucus plug in the cervix acts not only as a mechanical "cork" but the pus is actually lethal to spermatoza. Although in some cases spermatoza succeed in travelling up along the wall of the cervical canal, very few succeed in reaching their destination in the tube Chronic endocervicitis and cervicitis are responsible for a large percentage of the cases of sterility Tubal pus as a rule exerts an unfavorable influence on ovum and spermatoza if the tubes happen to be open which is not the rule, for tubal suppuration most often ends in tubal occlusion The latter is more commonly due to gonorrhoea and next in frequency it follows post abortion and post partum infections Tubal closure is responsible for about 40% (39 8% out of 2,000 personal cases) of all sterile marriages Tubercular salpingitis may be said to occur once out of every fifteen or twenty cases of tubal closure, in some series the incidence may be a little higher

In practice one meets with an unfortunate class of primarily fertile women who have subjected themselves to an induced abortion the first time they became pregnant and thus have sterilized themselves through the infection that followed The trouble in these cases lies as a rule in the tubes which become sealed off by the inflammation following the artificial early termination of pregnancy The ovaries in severe cases may also be involved in disease and thus add another difficulty On the other hand women are met who owe their sterility to an innocent peritonitis produced by an attack of appendicitis before marriage or soon after marriage In such instances a pelvic abscess forms which affects the fimbria and seals them off in the healing process It is in these cases where the use of utero-tubal insufflation is of pathognomonic value

Of all the constitutional anomalies, infantilism is probably the most important clinically as it is most often encountered The ovaries do not function normally, oligo and amenorrhoeas are frequent, occasionally meno-metrorrhagias (hyper and polymenorrhoea) The tubes exhibit tortuosity, angulations and tight points and possess poor muscular development The uterus is poorly developed, menstruation is frequently associated with dysmenorrhoea In case impregnation takes place it offers a poor site for ovular implantation The cervical canal is tight, very short and sometimes long and often kinked at the internal os These patients exhibit greater tendency to local spasm which also acts as a deterrent against impregnation. The introitus is tight by virtue of the fact that the muscles are either in spasm or the connective tissue is very dense and inelastic. This fact has a bearing upon the severe tears encountered in these cases that do get pregnant and go to term The labor is as a rule difficult and tedious The uterine muscle is relatively weak, inertia uteri is common Post partum hemorrhage is not uncommon It is well to recognize this class of patients if one would be prepared to protect them in the obstetric emergencies and for purposes of prognosis and treatment

On the male side congenital anomalies are less frequent. Failures in development parallel to those of the female partner occur but they are more apparent The vast majority of sterile males have acquired their defect by gonorrhoeal infection On the other hand impotence is by far more common amongst them and as compared to female frigidity is of greater etiological importance Mechanical factors are encountered in hypospadias and epispadias Urethral fistulae also prevent proper insemination by leakage outside of the vagina Deviations of the axis of the penis may also prevent normal insemination Psychic impotence is, however, far more frequently encountered than mechanical impotence

The generative type of impotence may be and is as a rule accompanied by perfect coitus There is however in the discharge from the penis, complete absence of spermatoza which are present in the testes but fail to find their way owing to some obstruction in the genital tract, or there is actually a complete failure of spermatozoic production The latter condition is as a rule hopeless, while in aspermatism due to bilateral stricture of the vas, operative treatment offers some hope for relief and successful cases have been recorded In the male as well as in the female, a careful clinical history with, if necessary judicious psychoanalysis is of great importance in determining etiology, prognosis and therapy

Special mention should be made of temporary lowering of fertility in males who may previ-

ously have been highly fertile The reduced fertility is evidenced by a marked diminution in the numbers and character of the spermatozoa The latter exhibit either no motility at all or relatively weak and atypical motion, while the majority in other specimens may be abnormal morphologically In general the conditions encountered in these instances are overwork or prolonged mental strain The temporary lowered vitality may also be due to some intercurrent disease Occasionally sedentary occupation is at the bottom of the altered spermatogenic function That these factors are causative may be assumed from the fact that when corrected through hygienic measures including athletic exercise, by regulating the occupation, a sojourn into the country, they prove beneficial to these patients and fertility is restored

A striking example of reduced fertility associating the habitual offering up of the patient's blood for transfusion was encountered by me in the person of a clergyman The latter chanced to be a universal donor and believed it to be his special mission to give up a half pint to a pint of his blood at frequent intervals to indigent persons When finally he could be prevailed upon to withhold this "benevolence" his wife became pregnant

Diagnostic Procedures

These may be briefly stated The routine which has been found useful is the following After taking a careful history which includes an inquiry into the data already mentioned and a careful general and local physical examination, the woman is instructed to appear for examination within one or two hours after coitus The bladder must not be emptied after coitus and until the specimen of the vaginal and cervical secretion is obtained The secretions are best obtained from the vagina by means of a pipette from which a smear is made The vagina is then carefully wiped till the vaginal portio including the external os is clean Another smear is made from the secretion obtained by another sterile pipette introduced into the cervical canal If a mucus plug be present, this can be smeared separately on the glass slide By means of aspiration the plug may be removed and another smear be taken from the cervical canal

A second post-coital examination after an interval of several days will serve to check up the matter of mechanical impotence In the event of very few spermatozoa being found in the vaginal secretions it is well to obtain a condom specimen Again a suitable interval of time must elapse before intercourse is permitted so as to exclude the factor of exhaustion The normal male regenerates spermatozoa within a few days and absence of the gametes under these provisions points to defective production The normal specimen of semen as obtained from the condom contains millions of swarming motile spermatozoa as seen under the microscope If this is found to be the case under examination, it is fair to conclude that the delivery of the secretion is defective and inquiry into this factor can then be instituted. If the condom specimen shows deficient numbers the source is disturbed or the transmission is disturbed Both may be the case

If no spermatozoa are recovered from the condom specimen it is safe to say that there is a blockade of the vasa deferentia or complete unproductivity in the testes Aspiration of the latter may be resorted to when repeated examination fails to demonstrate the presence of spermatozoa The matter of motility is also of importance but care must be exercised in judging the circumstances under which the specimen has been obtained and when it is received for examination The normal fresh specimen of semen will show at least half the number of spermatozoa alive, no matter how the specimen has been obtained unless of course the vessel containing it has had some chemical or destructive agency

The findings in the genital canal are various

1 There may be small numbers of spermatozoa in the vagina and in the cervix. This means either insufficient quantity and quality of semen, imperfect intromission or the patient herself involuntarily expels the semen by wrong muscular action, by urination or defecating

2 Large numbers of motile spermatozoa in the cervix are sometimes found without an equivalent number in the vagina This finding, however, is favorable for impregnation, it indicates that the ejaculation was normal and ample but that the greater part has been evacuated from the vagina by muscular contractions

3 Large numbers of live spermatozoa in the vagina indicate ample production and delivery on the part of the male and friendly secretions on the part of the vagina

4 Large numbers of dead spermatozoa in the vagina a short time after coitus indicate unfavorable vaginal secretions

These findings suggest the steps to be taken in the therapeutic consideration of the sterile mating

Tubal patency or non-patency can now be diagnosticated by the method of peruterine carbon dioxide insufflation The method consists in insufflating the tubes with a slow current of carbon dioxide gas through a uterine cannula *under manometric and volumetric control* and noting whether the gas enters the peritoneal cavity or not In general a quantity of 100-150 c c suffices to produce a subphrenic pneumoperitoneum which can be determined by fluoroscopic examination and the *x*-ray plate, and is characterized by the subjective symptom of shoulder pains or interscapular pains Occasionally, there is subdiaphragmatic discomfort which the patient experiences for several minutes These pains are

mild, momentary and can be immediately relieved by the patient assuming the recumbent posture Carbon dioxide gas is rapidly absorbed and is superior to any other gas or air It is an office procedure and permits the patients to resume their daily routine after the examination has been made In thin individuals from 40-60 c.c. suffice to establish a momentary subphrenic pneumoperitoneum In normally patent tubes the gas reaches a certain pressure below 100 mm Hg, dropping 20, 30 or 40 mm Hg as soon as the tubo-uterine junction has been passed when it rapidly passes through the tubes into the peritoneal cavity

As normal tubes are in constant rhythmic contractions the gas undergoes pressure fluctuations which may be registered on the kymograph When the tubes are non-patent, the gas pressure is noted to rise to 200 mm Hg, the highest limit to which the pressure should be subjected in testing for patency of tubes In such case no subphrenic pneumoperitoneum results, nor are the subjective shoulder pain symptoms present. The test may be repeated at once or at monthly intervals at the same time with reference to the menstrual cycle Three insufflations with failure to produce a subphrenic pneumoperitoneum may be taken to prove tubal closure Exceptionally a fourth insufflation will succeed in opening the tubes and may therefore be done for therapeutic purposes The post-menstrual phase is the most favorable for tubal insufflation

In the presence of permeable strictures the gas rises to pressures usually between 100 and 200 mm Hg and drops gradually and steadily without showing the tendency to fluctuate When the tubes are in a condition of spasm, pressure is usually high, between 100 and 200 mm Hg, but when the spasm is released, it drops, describing fluctuations which are observed in the normal tube cases A spastic condition of the tubo-uterine junction of the tubes can be overcome by preliminary administrations of atropine

The matter of localization of the obstruction is of importance from a prognostic and therapeutic standpoint It has been found by repeated observation controlled both by subsequent laparotomy as well as by lipiodol injection, that when both tubes are closed at the uterine ends, the pressure rises to 200 mm Hg and as a rule the patient feels discomfort over the symphisis in the midline, referable to the uterus When the tubes are closed at the isthmi, the same high pressure and the same median supra-symphiseal discomfort is noted by the patient with slight pain just lateral to the uterus When the tubes are closed at the fimbria and are distended by the gas, increasing pressure up to 200 mm Hg produces a more intense pain that radiates well out to the sides and is unmistakable as being referrable to the distended tubes For practical purposes this symptom complex is pathognomonic for the site of tubal obstruction. Only in cases where a plastic operation upon the tubes is contemplated, may this procedure be supplemented by the injection of lipiodol or other iodized oil in the uterus In the last twenty-five cases I have found the lipiodol examination to corroborate the CO_2 insufflation findings with respect to the site of obstruction

Precautions in Diagnosis

It is well to emphasize the fact that no couple should be told they are sterile unless all the factors have been most scrupulously analyzed and the examinations, made with the greatest care, have corroborated each other and have been counterchecked It is readily seen what untold harm can result from a premature or erroneous verdict of sterility imputed to either partner Especially far reaching in the harmful effect upon the male as well as upon the married couple is the decision that the former is hopelessly sterile It so happens that the average woman who is chiefly interested in the problem of sterility, submitting the more readily of the two to all manners of investigation and even to treatment, does not take kindly to a verdict of male sterility The male on the other hand can be led into a very obstinate psychosis It is always best in such case to give them the benefit of the doubt and my practice has been to encourage the adoption of a baby holding out the hope that nature might restore fertility in due time

Prognosis

No promise should be made to a patient that elimination of the apparent cause of her childlessness will be followed by fertility Thus for example a cervical inflammation may be cleared up by treatment and although it may be the only abnormality found, pregnancy may not soon ensue It is surprising how conception will take place in the presence of marked muco-purulent production from the cervix in some cases Apparently a highly fertile male compensates for the deficiency in the female

It is well to attempt to estimate not only the individual degree of fertility in each sex but to state the combined degree of fertility Thus for example, a highly potent male (90-100%) will impregnate his mate who may enjoy only 60-70% fertility The threshold may generally speaking be placed at a combined fertility of 75% If the conditions favor at least that percentage, or more, the prognosis is good for the immediate future If this percentage is not reached, the prognosis is relatively poor Our efforts are naturally bent in improving the fertility in each individual beyond that point so that the combined degree of fertility can be higher In the woman certain data may be of prognostic aid the history of operative removal of one tube or ovary, a previous ventrosuspension or myomectomy, an attack

ously have been highly fertile The reduced fertility is evidenced by a marked diminution in the numbers and character of the spermatozoa The latter exhibit either no motility at all or relatively weak and atypical motion, while the majority in other specimens may be abnormal morphologically In general the conditions encountered in these instances are overwork or prolonged mental strain The temporary lowered vitality may also be due to some intercurrent disease Occasionally sedentary occupation is at the bottom of the altered spermatogenic function That these factors are causative may be assumed from the fact that when corrected through hygienic measures including athletic exercise, by regulating the occupation, a sojourn into the country, they prove beneficial to these patients and fertility is restored

A striking example of reduced fertility associating the habitual offering up of the patient's blood for transfusion was encountered by me in the person of a clergyman The latter chanced to be a universal donor and believed it to be his special mission to give up a half pint to a pint of his blood at frequent intervals to indigent persons When finally he could be prevailed upon to withhold this "benevolence" his wife became pregnant

These may be briefly stated The routine which has been found useful is the following After taking a careful history which includes an inquiry into the data already mentioned and a careful general and local physical examination, the woman is instructed to appear for examination within one or two hours after coitus The bladder must not be emptied after coitus and until the specimen of the vaginal and cervical secretion is obtained The secretions are best obtained from the vagina by means of a pipette from which a smear is made The vagina is then carefully wiped till the vaginal portio including the external os is clean Another smear is made from the secretion obtained by another sterile pipette introduced into the cervical canal If a mucus plug be present, this can be smeared separately on the glass slide By means of aspiration the plug may be removed and another smear be taken from the cervical canal

A second post-coital examination after an interval of several days will serve to check up the matter of mechanical impotence In the event of very few spermatozoa being found in the vaginal secretions it is well to obtain a condom specimen Again a suitable interval of time must elapse before intercourse is permitted so as to exclude the factor of exhaustion The normal male regenerates spermatozoa within a few days and absence of the gametes under these provisions points to defective production The normal specimen of semen as obtained from the condom contains millions of swarming motile spermatozoa as seen under the microscope If this is found to be the case under examination, it is fair to conclude that the delivery of the secretion is defective and inquiry into this factor can then be instituted If the condom specimen shows deficient numbers the source is disturbed or the transmission is disturbed Both may be the case

If no spermatozoa are recovered from the condom specimen it is safe to say that there is a blockade of the vasa deferentia or complete unproductivity in the testes Aspiration of the latter may be resorted to when repeated examination fails to demonstrate the presence of spermatozoa The matter of motility is also of importance but care must be exercised in judging the circumstances under which the specimen has been obtained and when it is received for examination The normal fresh specimen of semen will show at least half the number of spermatozoa alive, no matter how the specimen has been obtained unless of course the vessel containing it has had some chemical or destructive agency

The findings in the genital canal are various

1 There may be small numbers of spermatozoa in the vagina and in the cervix This means either insufficient quantity and quality of semen, imperfect intromission or the patient herself involuntarily expels the semen by wrong muscular action, by urination or defecating

2 Large numbers of motile spermatozoa in the cervix are sometimes found without an equivalent number in the vagina This finding, however, is favorable for impregnation, it indicates that the ejaculation was normal and ample but that the greater part has been evacuated from the vagina by muscular contractions

3 Large numbers of live spermatozoa in the vagina indicate ample production and delivery on the part of the male and friendly secretions on the part of the vagina

4 Large numbers of dead spermatozoa in the vagina a short time after coitus indicate unfavorable vaginal secretions

These findings suggest the steps to be taken in the therapeutic consideration of the sterile mating

Tubal patency or non-patency can now be diagnosticated by the method of peruterine carbon dioxide insufflation The method consists in insufflating the tubes with a slow current of carbon dioxide gas through a uterine cannula *under manometric and volumetric control* and noting whether the gas enters the peritoneal cavity or not In general a quantity of 100-150 c c suffices to produce a subphrenic pneumoperitoneum which can be determined by fluoroscopic examination and the *x*-ray plate, and is characterized by the subjective symptom of shoulder pains or intrascapular pains Occasionally, there is subdiaphragmatic discomfort which the patient experiences for several minutes These pains are

mild, momentary and can be immediately relieved by the patient assuming the recumbent posture Carbon dioxide gas is rapidly absorbed and is superior to any other gas or air It is an office procedure and permits the patients to resume their daily routine after the examination has been made In thin individuals from 40-60 c.c. suffice to establish a momentary subphrenic pneumoperitoneum In normally patent tubes the gas reaches a certain pressure below 100 mm Hg, dropping 20, 30 or 40 mm Hg as soon as the tubo-uterine junction has been passed when it rapidly passes through the tubes into the peritoneal cavity

As normal tubes are in constant rhythmic contractions the gas undergoes pressure fluctuations which may be registered on the kymograph When the tubes are non-patent, the gas pressure is noted to rise to 200 mm Hg, the highest limit to which the pressure should be subjected in testing for patency of tubes In such case no subphrenic pneumoperitoneum results, nor are the subjective shoulder pain symptoms present The test may be repeated at once or at monthly intervals at the same time with reference to the menstrual cycle Three insufflations with failure to produce a subphrenic pneumoperitoneum may be taken to prove tubal closure Exceptionally a fourth insufflation will succeed in opening the tubes and may therefore be done for therapeutic purposes The post-menstrual phase is the most favorable for tubal insufflation.

In the presence of permeable strictures the gas rises to pressures usually between 100 and 200 mm Hg and drops gradually and steadily without showing the tendency to fluctuate When the tubes are in a condition of spasm, pressure is usually high, between 100 and 200 mm Hg, but when the spasm is released, it drops, describing fluctuations which are observed in the normal tube cases A spastic condition of the tubo-uterine junction of the tubes can be overcome by preliminary administrations of atropine

The matter of localization of the obstruction is of importance from a prognostic and therapeutic standpoint It has been found by repeated observation controlled both by subsequent laparotomy as well as by lipiodol injection, that when both tubes are closed at the uterine ends, the pressure rises to 200 mm Hg and as a rule the patient feels discomfort over the symphisis in the midline, referable to the uterus When the tubes are closed at the isthmi, the same high pressure and the same median supra-symphiseal discomfort is noted by the patient with slight pain just lateral to the uterus When the tubes are closed at the fimbria and are distended by the gas, increasing pressure up to 200 mm Hg produces a more intense pain that radiates well out to the sides and is unmistakable as being referable to the distended tubes For practical purposes this symptom complex is pathognomonic for the site of tubal obstruction. Only in cases where a plastic operation upon the tubes is contemplated, may this procedure be supplemented by the injection of lipiodol or other iodized oil in the uterus In the last twenty-five cases I have found the lipiodol examination to corroborate the CO_2 insufflation findings with respect to the site of obstruction

Precautions in Diagnosis

It is well to emphasize the fact that no couple should be told they are sterile unless all the factors have been most scrupulously analyzed and the examinations, made with the greatest care, have corroborated each other and have been counterchecked It is readily seen what untold harm can result from a premature or erroneous verdict of sterility imputed to either partner Especially far reaching in the harmful effect upon the male as well as upon the married couple is the decision that the former is hopelessly sterile It so happens that the average woman who is chiefly interested in the problem of sterility, submitting the more readily of the two to all manners of investigation and even to treatment, does not take kindly to a verdict of male sterility The male on the other hand can be led into a very obstinate psychosis It is always best in such case to give them the benefit of the doubt and my practice has been to encourage the adoption of a baby holding out the hope that nature might restore fertility in due time

Prognosis

No promise should be made to a patient that elimination of the apparent cause of her childlessness will be followed by fertility Thus for example a cervical inflammation may be cleared up by treatment and although it may be the only abnormality found, pregnancy may not soon ensue It is surprising how conception will take place in the presence of marked muco-purulent production from the cervix in some cases Apparently a highly fertile male compensates for the deficiency in the female

It is well to attempt to estimate not only the individual degree of fertility in each sex but to state the combined degree of fertility Thus for example, a highly potent male (90-100%) will impregnate his mate who may enjoy only 60-70% fertility The threshold may generally speaking be placed at a combined fertility of 75% If the conditions favor at least that percentage, or more, the prognosis is good for the immediate future If this percentage is not reached, the prognosis is relatively poor Our efforts are naturally bent in improving the fertility in each individual beyond that point so that the combined degree of fertility can be higher In the woman certain data may be of prognostic aid the history of operative removal of one tube or ovary, a previous ventrosuspension or myomectomy, an attack

ously have been highly fertile The reduced fertility is evidenced by a marked diminution in the numbers and character of the spermatozoa The latter exhibit either no motility at all or relatively weak and atypical motion, while the majority in other specimens may be abnormal morphologically In general the conditions encountered in these instances are overwork or prolonged mental strain The temporary lowered vitality may also be due to some intercurrent disease Occasionally sedentary occupation is at the bottom of the altered spermatogenic function That these factors are causative may be assumed from the fact that when corrected through hygienic measures including athletic exercise, by regulating the occupation, a sojourn into the country, they prove beneficial to these patients and fertility is restored

A striking example of reduced fertility associating the habitual offering up of the patient's blood for transfusion was encountered by me in the person of a clergyman The latter chanced to be a universal donor and believed it to be his special mission to give up a half pint to a pint of his blood at frequent intervals to indigent persons When finally he could be prevailed upon to withhold this "benevolence" his wife became pregnant

Diagnostic Procedures

These may be briefly stated The routine which has been found useful is the following After taking a careful history which includes an inquiry into the data already mentioned and a careful general and local physical examination, the woman is instructed to appear for examination within one or two hours after coitus The bladder must not be emptied after coitus and until the specimen of the vaginal and cervical secretion is obtained The secretions are best obtained from the vagina by means of a pipette from which a smear is made The vagina is then carefully wiped till the vaginal portio including the external os is clean Another smear is made from the secretion obtained by another sterile pipette introduced into the cervical canal If a mucus plug be present, this can be smeared separately on the glass slide By means of aspiration the plug may be removed and another smear be taken from the cervical canal

Only in cases where a plastic operation upon the tubes is contemplated, may this procedure be supplemented by the injection of lipiodol or other iodized oil in the uterus In the last twenty-five cases I have found the lipiodol examination to corroborate the CO_2 insufflation findings with respect to the site of obstruction

Precautions in Diagnosis

It is well to emphasize the fact that no couple should be told they are sterile unless all the factors have been most scrupulously analyzed and the examinations, made with the greatest care, have corroborated each other and have been counterchecked. It is readily seen what untold harm can result from a premature or erroneous verdict of sterility imputed to either partner Especially far reaching in the harmful effect upon the male as well as upon the married couple is the decision that the former is hopelessly sterile It so happens that the average woman who is chiefly interested in the problem of sterility, submitting the more readily of the two to all manners of investigation and even to treatment, does not take kindly to a verdict of male sterility The male on the other hand can be led into a very obstinate psychosis It is always best in such case to give them the benefit of the doubt and my practice has been to encourage the adoption of a baby holding out the hope that nature might restore fertility in due time

Prognosis

No promise should be made to a patient that elimination of the apparent cause of her childlessness will be followed by fertility Thus for example a cervical inflammation may be cleared up by treatment and although it may be the only abnormality found, pregnancy may not soon ensue It is surprising how conception will take place in the presence of marked muco-purulent production from the cervix in some cases Apparently a highly fertile male compensates for the deficiency in the female

It is well to attempt to estimate not only the individual degree of fertility in each sex but to state the combined degree of fertility Thus for example, a highly potent male (90-100%) will impregnate his mate who may enjoy only 60-70% fertility The threshold may generally speaking be placed at a combined fertility of 75% If the conditions favor at least that percentage, or more, the prognosis is good for the immediate future. If this percentage is not reached, the prognosis is relatively poor Our efforts are naturally bent in improving the fertility in each individual beyond that point so that the combined degree of fertility can be higher In the woman certain data may be of prognostic aid the history of operative removal of one tube or ovary, a previous ventrosuspension or myomectomy, an attack

of appendicitis, habitual oligo and amenorrhoea In the male, the history of bilateral epididymitis, atrophic or undescended testicles, early impotence, etc, is of importance

General Instructions to the Married Couple Seeking Relief from Sterility

It is best for them to occupy separate beds, to maintain periods of continence beginning with a minimum of two weeks and increasing to four or more weeks The most favorable time for a fruitful coitus is within the middle two weeks between two periods Intercourse must be forbidden in case a menstrual period is overdue

The matter of exercise should be gone into Adequate rest with an occasional vacation, removing sources of mental worry and adjustment in domestic relations are sometimes followed by gratifying results Rational and appropriate diet is important The knee-chest position is helpful in cases associated with retroversions and retroflexions Cleansing douches of plain boiled water or mildly alkaline solutions can be used where there is marked hyperacidity and profuse mucous discharge Some women defeat their own purposes by using antiseptic douches after coitus A properly fitted pessary can aid in conception in cases of retroversion

Therapy in the Female

The aim and object of therapy in female sterility is to correct abnormalities and to restore anatomical relations and, if possible, functional conditions to as nearly normal as possible There are cases indeed where the most painstaking examination may fail to reveal any deviation from correct anatomical and physiological conditions The causative factors in such cases are not understood and have so far not been determined But theses are rather the exception than the rule In the vast majority, gross changes are present It must be admitted that pregnancy not infrequently occurs in the presence of apparently insurmountable obstacles There is no true biologic method by which we can prognosticate in a given human mating whether it may prove fertile Sterility may definitely be foretold when the fallopian tubes are closed and when the testes fail to produce spermatozoa and the latter cannot be properly ejaculated when produced In at least one-third of the sterility cases the tubes have been found to be non-patent In the patent tube cases the explanation is more difficult

In general, treatment will be directed against

1 Inadequate orifices, vaginal, cervical, tubal and tubo-uterine
2 Inimical vaginal and cervical secretions
3 Maldevelopment and constitutional anomalies
4 Ovarian functional disturbances and their secondary effects
5 Psycho-sexual disturbances

1 The mechanical causes lie in such barriers as imperforate hymen, rigid hymen, hypersensitive introitus, vaginal stenosis, small tight external os and stricture of the cervix with or without the mucus plug These conditions with the exception of the last named suggest their own appropriate mechanical treatment. Here mention need only be made that the discision operations upon the cervix have a limited scope and leave in their wake sequelae that frequently make matters worse The simple thorough dilatation of the cervix with the insertion of a stem pessary is far preferable to the Dudley or the Pozzi operations

2 Secretions in the vagina which are definitely due to vaginitis are lethal to spermatozoa The vaginitis can be cleared up by astringent douches, the introduction of Kaolin or Lassar's paste and tampon, Sitz baths, rest and coital continence. Abnormally acid vaginal secretions in the absence of vaginitis can be in part overcome by alkaline douches The cervical mucus plug as well as purulent escape from the cervix must be cleared up by topical applications, aspiration, douches, tampons, cauterization and dilatation The treatment is tedious and is not always efficacious The lesion requires clearing up whether or not the patient is interested in relieving her sterility

3 Mal-development and constitutional anomalies form the basis for a poor prognosis Unless they are obstructive in character and can be eliminated by surgical measures, such as the discision of an imperforate hymen, the removal of a vaginal bar, the enucleation of fibroids and polypi, developmental genital backwardness offers a poor prognosis Infantilism, local or general, can be aided by forced feeding, systematic exercise out of doors and other hygienic measures Such women may be said to "catch up" much later in their reproductive period The marital act may be said to promote "local gluital" development.

Psycho-sexual disturbances apparently have an inhibitory effect upon fertility in both sexes Frigidity and dispareunia in the female and impotence in the male can be corrected by suggestion, psycho-analytic interpretation, by proper physical and mental hygiene and not infrequently time causes spontaneous healing

4 Ovarian functional disturbances with their secondary effects upon the menstrual cycle, chiefly amenorrhoea and meno-metrorrhagia, sometimes come to a spontaneous correction Organotherapy is not of uniform benefit in these cases, but newer pharmacological methods of extraction and preparation promise to give better results The fractional doses of x-ray irradiation have proven of decided benefit in the habitually delayed menstrual type In my first series, nine out of twelve became pregnant after the menses had been restored while in a larger series, over 50% have become pregnant after the restoration to the normal menstrual type The ovarian dis-

turbance is often associated with other endocrine gland derangement, chiefly of the thyroid and the hypophysis The administration of thyroid gland has so far offered some definite aid both in amenorrhoea and meno metrorrhagia and should be given a trial before resorting to *x*-ray therapy A basal metabolism estimation is of decided help in determining the thyroid dosage Anterior lobe pituitary extracts have an empirical value and may be given to stimulate ovarian or testicular function

5 Impotence in the male is in the vast majority of cases of psychic origin It has been estimated that in only 5-10% of the cases, impotence is due to some mechanical factor The treatment is suggestive or radical (psycho-analysis) The latter is to be reserved for advanced and aggravated cases As a rule, winning the patient's confidence by reassurance and encouragement, offering a favorable prognosis, even that of absolute cure, go a long way toward restoring potency If one can find the psychic factor which has led to the impotence, suggestive therapy becomes simpler This would vary considerably In any event, an important part of the psychic treatment is to engage the patient's mind in work or diversion which tends to keep him from his perverted trend of thought For the more aggravated case (psychopathic), outdoor exercise and suitable occupation, such as gardening, tend to quiet the mind and insure sexual rest General hygienic measures and dietetic instructions which tend to promote the patient's nutrition and maintain normal metabolism are of importance in psychic depression Baths are said to be of considerable help in restoring potency The best type consists of luke warm to cold water bathing followed by spinal douches Carbon dioxide and oxygen baths are stimulating In some cases the use of the Galvanic, Faradic and Franklenization currents are useful Topical applications formerly employed almost to the exclusion of psycho-therapy, has a limited field in the treatment of male impotence, and is best left in the hands of urologists

In cases of aspermia due to obliteration or stricture of the seminal-excretory duct, the implantation of the vas deferens into the head of the epididymis as recommended by Martin, can sometimes, but rarely, be followed by success It is worth a trial in desperate cases where offspring are desired and where any measure offering the slightest prospect of success is welcome

The most favorable type of impotence is that which is due to constitutional syphilis Antiluetic treatment can result in restoration of function Local mercury inunctions over long periods of time, combined with internal administration of potassium iodide will prove of benefit in luetic epididymitis Long periods of abstinence are also of decided benefit in cases where excessive venery is a factor

Chronic morphinism is associated with impotence and in those cases yielding to anti-morphin treatment, function may be restored

Sterility in the male being involved with gonorrhoea to such a large extent can better be prevented than cured Too much emphasis cannot be laid upon venereal prophylaxis

6 *Artificial impregnation* In impotence due to mechanical deformity of the penis a fresh condom specimen can supply the semen for artificial impregnation The condom should be sterilized beforehand, and the penis thoroughly cleansed Whenever possible it is preferable to secure the specimen ejaculated directly into a sterilized glass vessel as it is less apt to deteriorate in glass than in a condom The cervix is exposed and cleansed and with a sterile pipette containing a c c. of semen the latter is injected into the upper portion of the cervical canal If the latter is plugged by mucus it should first be cleaned out by aspiration and cotton applicators and a drop or two of the semen may be introduced into the uterine cavity Great care should be exercised in injecting, avoiding much pressure, as the semen can be injected into the tubes and out into the peritoneal cavity resulting in peritoneal irritation and pelvic inflammation

Where this is feared the fresh semen can be transferred into a mensinga cervical cup and fitted over the cervix for 24 hours

The semen aspirated from the testes or epididymis is rarely ever efficacious When it becomes necessary to resort to this procedure the question of borrowing the semen from a close male relative or some other outside source sometimes comes up This is a rather complicated subject requiring sociological and medico-legal attention and one should undertake it with a great deal of caution

The deposition of a drop of semen from a sterile platinum loop into the cervix and then followed by peruterine insufflation has been recommended by L Fraenkel, who claims to have had success in a few cases

Peruterine insufflation shortly after coitus within an hour or so, accomplishes the same thing provided motile spermatozoa are found in the cervical canal By instructing the patient to have coitus after the insufflation when the genital tract is opened up, a better chance is offered for impregnation to take place Not a few of the successful results in my own cases appear to have followed either of these alternative procedures

The artificial injection of semen should be a dernier resort in carefully selected cases having due regard for all the hazards and precautions Success has been reported by Dickinson and others in a few instances, and therefore gives encouragement to those couples where everything else may have been tried in vain

Therapeutic Procedures in Cases of Tubal Non-patency

A Non-surgical (therapeutic application of peruterine insufflation)

B Surgical

(A) From the earliest use of the method of insufflating the uterus and tubes for diagnostic purposes, it was recognized that it might also prove to have some therapeutic value Peterson and Cron were amongst the first to report pregnancies following peruterine tubal insufflation They state "A number of patients examined for sterility by the Rubin Test where the gas had been forced through the tubes, reported that pregnancy had followed without change of other conditions present during the time they have been *desirous of children*" In 13 out of 36 patients who replied to their questionnaire, pregnancy had ensued An accumulating number of reports from other sources (Meaker, Rongy, Henderson and Amos, Hirst and Mayer, and Aldridge, and others) have corroborated Peterson's and Cron's first statement

In May, 1925, I reported 95 cases of pregnancy out of a series of 1,000 consecutive cases in whom utero-tubal insufflation had been done Inasmuch as at least one-third of these patients had totally occluded tubes, the percentage is increased, making that first series 14% pregnancies In a later series of 1,800 personal cases, 180 patients reported pregnancy If we exclude one-third of these patients who had totally occluded tubes, the corrected percentage would be approximately 15% In other words, one out of six patients coming for the relief of sterility, and whose tubes are not totally closed, becomes pregnant following the peruterine tubal insufflation It must, however, be noted in this connection that no definite systematic questionnaire has been sent out to these patients, the reports being quite voluntary It is possible, therefore, that the figures may be somewhat higher if all available data were at hand At the same time it is only fair to add that other factors probably have entered into the successful results following this method

Particularly may the test be said to be of therapeutic value when a woman married for five years or over and previously sterile becomes pregnant the month following a peruterine insufflation If other measures had been tried without avail the insufflation procedure may be presumed to have exercised a therapeutic effect even though two or several months elapse before pregnancy ensues In infertile marriages of ten years duration or longer the insufflation test has proved of definite therapeutic value Twenty-two of the first series of cases were in couples married five years and over In five the marriage had lasted ten years or over before pregnancy took place Two of these were married fifteen years

Peruterine insufflation exerts a therapeutic influence in several ways

1 By establishing patency of the genital tract from the external os of the servix to the abdominal opening of the fallopian tubes It is possible that the so-called "pinpoint" os is stretched by the introduction of the cannula and renders it more patulous for the reception of semen

2 It enables the cervix to expel a mucus plug from its deeper portion after the insufflation and upon withdrawal of the uterine cannula

3 It separates mild agglutinations of the folds of tubal mucosa, straightens out tortuous tubes, especially the infantile type, dislodges a mucus inspissation from a narrow to a wider portion of the tube, separates adhesions of the fimbriated end in cases requiring 150-200 mm Hg of pressure Cases are accumulating where higher pressures than 100 mm Hg, indicating incomplete stenosis of the tubes, have become pregnant as a result of the insufflation Several patients in my own experience have become pregnant after a third or fourth insufflation

4 By overcoming utero-tubal spasm in some cases, insufflation prepares the female genitals for favorable reception of spermatozoa

5 Finally, it may be assumed that the method may stimulate the psyche and as with other therapeutic agencies, accomplish a result through suggestion The explanation is difficult in these cases, and the matter of coincidence cannot always be excluded

(B) *Surgical procedures*

1 The simple opening of the fimbria when they are lightly agglutinated, squeezing the tube and milking it outwards The prognosis in these cases is good as there is very little trauma and practically no bleeding These cases are rather rare, however

2 By making a stoma at the closed end of a hydrosalpinx

3 By partial resection of the occluded portion of the tube, leaving the patent portion free and securing bleeding by fine ligatures When the isthmic portion is left, the serosa may be reflected back for a centimeter, leaving the muco-muscular tube bare and simply tying the ligature lightly over it so as to prevent oozing

4 When the isthmus is blocked, the tubo-uterine junction and occluded isthmus may be resected as far as the patent point is reached and implanting the latter into the fundus The operation may be unilateral or bilateral

5 When tubes are absent, having been removed by surgical operation, or when they are irreparably obliterated, they may be completely removed and an ovary may be implanted into the uterine cavity on one or both sides (The method of Tuffier)

Successful results have been reported from each of these procedures, and although the percentage of success is not great, they offer some chance to the married couple who would take advantage of any therapeutic measure for the sake of having an offspring

SOME LESS WELL RECOGNIZED SYMPTOMS OF PROSTATIC OBSTRUCTION*

By ARTHUR L CHUTE, BOSTON, MASS

It is my purpose to call your attention to the atypical symptoms that certain cases of prostatic obstruction may show, symptoms that deceived me when I first encountered them, and which I have found have deceived others as well

In most instances of prostatic obstruction the predominant symptoms are those of bladder irritation, they are frequent, difficult, and painful urination, one or all, often associated with changes in the urine These changes may indicate an inflammatory process that has been engrafted upon the underlying condition, or may indicate renal embarrassment due to back pressure. Symptoms of this sort, when they appear in men of middle life or after, are so suggestive of prostatic obstruction that one almost automatically makes a digital examination of the prostate which will give conclusive evidence in most instances In cases of this sort in which, for one reason or another, one is still in doubt as to the diagnosis, the use of a catheter or cystoscope will usually settle the question quickly and definitely

There are several conditions, however, in which due to an almost total absence of symptoms of bladder irritation, commonly the early and striking signs of prostatic obstruction, the recognition of this condition is not easy, due largely to the fact that these patients do not present the symptoms that raise the question of prostatic obstruction in the minds of most of us

A condition of this sort to which I wish to call your attention first, as it is by far the most important to recognize, and is as well the one most easily overlooked, is the one that has been called by some "dyspepsia urinaria," by others, "cachexia urinaria" In cases of this sort, the symptoms, as the names would indicate, point more to disease of the digestive tract than to that of the urinary tract. In some cases of this sort the mildness of the symptoms is such as to point to the digestive condition that we often speak of as a "dyspepsia", in others the intensity combined with a considerable cachexia, is such as to suggest malignant disease of the stomach This condition is presumably due to an unusual tolerance on the part of the bladder that allows a marked distension of that organ to take place without much resentment on its part. This distension of the bladder in time leads to a marked degree of renal back pressure and the consequent development of toxic, even preuremic symptoms, of the digestive type Whether or not this tolerance to over distension, on the part of the bladder, is the result of some abnormality of innervation, one can only surmise Be that as it may, as a result of the passing back to the kidneys of the pressure in the overdistended bladder, there is a marked cutting down of elimination on their part, with a toxic condition that may suggest serious, even malignant involvement of the digestive tract I shall cite briefly a few clinical examples

One of the early cases of this sort that I had a chance to study was that of a doctor 59 years old, seen with a medical friend in 1911 This man had been getting up once at night for a year or more and had sometimes had a little involuntary escape of urine at night. His symptoms were, however, predominantly those of digestive distress He had a bad taste in his mouth, was nauseated, vomited a considerable amount, and seemed to be at times on the verge of uraemia. He was put on a carefully regulated salt free diet and as he improved under this treatment he was allowed to spend the summer in Europe On his return in the late autumn he was again suffering from his former symptoms and I was asked to see him because of the possible relation of his urinary symptoms to his general condition I found his blood pressure 180, an over distended bladder, a benign prostate of moderate size, an unfected urine of low gravity I drew down his residual by intermittent catheterization, using every safeguard that I knew Three days after I began this, his urine showed infection, a week after I began, I put him on constant catheter drainage because of an increased urinary infection, and three weeks from the time I began to draw down his residual he died of pyelonephritis This man did have urinary symptoms to be sure, but the predominant ones were digestive He was treated for months on the assumption that his trouble depended on some medical condition rather than upon prostatic obstruction At that time we knew less of the treatment of "dyspepsia urinaria" than we do today and the patient was not treated as I should treat him now, but the outcome might nevertheless have been much the same since this condition is always a serious one

Another instance was that of a man of 55 seen a few years later, who had had a little dribbling of urine for a year, for nine months he had had "indigestion" and his "food had not set well" He had had nausea for 4 months, for 2 months he had been unable to work and had vomited "all the time." He had had gastro-intestinal *x*-rays that

*Read by invitation at the twenty ninth annual meeting of the Lake Keuka Medical and Surgical Association, at Keuka N Y July 12th and 13th 1928.

were negative He was salivated and at night had to tie a towel about his neck as he drooled a great deal during his sleep This man had a most suggestive pallor He was found to have a blood pressure of 160, a bladder that was well up to his umbilicus, and a residual of 40 ounces His bladder was opened under novocain and drained for a time His digestive symptoms improved within a short time and his salivation ceased Later a prostatectomy was done successfully This patient was last seen 11 years later, in good general condition, but with a urine that was not clear

At the time I opened this patient's bladder his haemoglobin was 30 per cent (Sahli) reds, 3,816,010, whites 11,400, marked achromia, no stippling, no blasts, or parasites A few days later his haemoglobin was 50 per cent Three weeks after operation this patient's haemoglobin was 63 per cent and there was very slight achromia The medical consultant who saw this patient with me insisted that his secondary anemia was due to a carcinoma of his stomach and it was a long time before he could be convinced that it was purely a case of "cachexia urinaria," due to prostatic obstruction

A man of 63, seen last summer, had had difficulty in urination with some frequency for two months He was nauseated, had more or less vomiting and diarrhea He was advised that he had indigestion due to bad teeth and that he ought to have them removed, so he had 17 extracted He waited for his mouth to heal but even after that had taken place there was no relief of his nausea Another doctor passed a catheter and removed 2 quarts of transparent urine When he came under my care his bladder was nearly up to his umbilicus, his urine transparent, his prostate, large, rounded, elastic, B P 208/134, his NPN 46 5 mg His bladder was drained for some days by the decompression method with an inlying catheter and then by a cystostomy for some little time Later his prostate was enucleated under spinal anesthesia He made a good recovery and has been free of digestive symptoms

While cases of prostatic obstruction do not present this picture commonly I have seen in the aggregate a considerable number of similar cases In none of these cases has there been an absolute absence of all urinary symptoms but in all there has been such a preponderance of symptoms referred to the alimentary tract as to mislead the practitioners who saw the patients at first, and to lead them to believe that the urinary symptoms were dependent upon the digestive trouble and were of secondary importance In these cases the symptoms have differed sufficiently from those ordinarily seen in cases of prostatic obstruction as to have been wrongly interpreted at first and the disease allowed to progress to a much more advanced stage than would otherwise have been allowed had the underlying condition been recognized earlier The fact that many of these patients have a non-infected urine, which in my experience has been the rule, though not without its exceptions, has undoubtedly been a factor that has helped to mislead

The diagnosis in this condition will usually be easy if one will but remember that digestive symptoms in middle aged or older men are now and again due to renal back pressure from an overdistended bladder One should always bear this in mind, in patients of prostatic age, who do not get relief of digestive symptoms under appropriate treatment The palpation of the suprapubic region will ordinarily show a tumor, easily recognized as a full bladder, to which may often be added on rectal examination the evidence of an enlarged prostate.

In certain other instances of prostatic obstruction we have both subjective and objective urinary symptoms to be sure, but not the ones that are most commonly seen in cases of prostatic obstruction, not those that speak strongly for bladder irritation There may be moderate frequency and a rather slow stream but there is no pain, no straining, and usually no great difficulty in voiding I refer to a certain number of patients, who having reached the prostatic age, begin to wet the bed, in some instances to have incontinence when they take a nap, even when sitting in a chair This is a certain modification of the so-called incontinence of overflow or paradoxical incontinence in that it does not occur when the patient is awake It presumably depends on a bladder that is moderately non-sensitive, since its overdistension is unattended with pain but yet a bladder in which it is nevertheless necessary to exercise a certain degree of voluntary control, sometimes apparently more or less unconsciously, in order to avoid incontinence In the first and second of the reported cases of "dyspepsia urinaria" this condition was present to a slight degree, but its significance had been overlooked in the face of the predominance of digestive symptoms I will relate briefly a few instances where nocturnal incontinence has been the striking symptom in cases of prostatic obstruction

A cardiac of 51, seen in 1919, began one and one-half years before I saw him to have nocturnal incontinence This was not attended with any bladder pain and he did not have this incontinence all the time During this year and a half he had also had on three occasions attacks of what were supposed to be severe colds attended with chills They kept him in bed for some weeks A lot of pus had been found in his urine at the time of these attacks but on the other hand he had to get up but once at night though he had had some difficulty in voiding By rectum no increase in size of his prostate had been made out On abdominal palpation this man was found to have a bladder that was practically up to his umbilicus His chief subjective symptom was incontinence, though he did at times have some straining on

urination In the absence of an enlarged prostate this incontinence had been thought to indicate some nervous derangement of the bladder This patient was subjected first to a cystostomy for drainage, which drainage was continued for about 3 months, a part of this three months he was allowed to spend in his own home Suprapubic enucleation was then carried out with relief to his symptoms and he was able to take up his business again He remained well to my knowledge for a number of years, dying about a year ago I do not know the cause of his death

A more typical case was that of a man of 72 seen some years ago Some 2 years before coming under my care, he had, on one occasion, had considerable difficulty in passing his urine while on a railroad train He finally succeeded, however, and had had no repetition of the trouble He ordinarily got up once at night, never more than twice, and while he had a small stream he did not have to strain to empty his bladder This man was referred to me for the reason that for some time, he had been wetting his bed practically every night, during his sleep His urine was transparent and the specific gravity was 1020, it contained neither sugar nor albumin, the phenolsulphonephthalein output was 24 per cent in 2 hours, the N P N 48 7 mg His blood pressure was 180/96 He showed a mass suprapubically that reached three-fifths of the way to his umbilicus and by rectum he presented a prostate considerably enlarged and typically benign in character A catheter proved that the suprapubic mass was an overdistended bladder This man's bladder was opened suprapubically, following this he was somewhat toxic, but this cleared up promptly under the use of subcutaneous salt solution Later his prostate was removed He has had no incontinence since his operation and when seen about two months ago reported himself as well

Patients with nocturnal incontinence often present themselves much mortified saying that they have reached their second childhood One most fastidious old bachelor of my acquaintance had his first incontinence while a guest in the home of a friend and had the mortification of wetting the bed He was operated upon with a disappearance of his symptoms At times these patients will have some frequency, when awake and perhaps a rather poor stream, but the striking symptom and the one that annoys them most, the one of which they complain, is their incontinence In some, especially at the beginning, there may be the escape of but a little urine and this at infrequent intervals, in others the incontinence may be so great as to make it necessary for them not alone to protect their beds, but also to change the bath towels in which they swathe themselves, several times at night. A number of patients of this sort, whom I have seen, have been given various things in the way of internal medication, quite without result, on the assumption that it was a true incontinence of urine As with the cases of "dyspepsia urinaria" palpation of the suprapubic region will usually show that the patient has an overdistended bladder, often times even inspection will make this evident as is sometimes the case in the instances of "cachexia urinaria"

It may be that in instances of both of the foregoing conditions the patient's abdominal wall may be too thick to make palpation of the overdistended bladder definite Many of these patients, however, will be rather thin as a result of their trouble and palpation will be easy In instances where suprapubic palpation is not decisive, the condition of the prostate, as felt by rectum, will often be helpful, in certain instances, however, it may be necessary to pass a catheter or even a cystoscope before one can be sure of his diagnosis The passage of a catheter or of a cystoscope should be done with the greatest care, especially in the patients who show a light gravity, uninfected urine

It is important to recognize the true nature of the basic trouble in both these conditions, both are ordinarily attended with a considerable degree of aseptic retention and the patient's margin of safety is practically always narrow in the first type, and may be so in the second, though it is perhaps somewhat less likely to be

There is yet another atypical symptom met in cases of prostatic obstruction to which I wish to call your attention

It seems to be pretty well proven that the introduction of any infectious material into the deep urethra may be followed by an epididymitis We see this in urethral infections with the diplococcus of Neisser, in instances where there has been urethral instrumentation as well as in patients in whom a catheter has been fixed in the urethra In instances of this sort the history makes the significance of the epididymitis evident

Beside instances of the above type there are seen, from time to time, instances of decidedly acute epididymitis coming on without, at first glance, an apparent cause, cases that are attended with a temperature and are too acute to make it probable that the epididymitis is tuberculous In a few instances this appearance of an apparently causeless epididymitis will be the first sign, subjective or objective, that a patient will have of a bladder infection that is secondary to a prostatic obstruction Given a man of prostatic age with a sharp and apparently causeless epididymitis one should consider the possibility of prostatic obstruction Naturally one will find that the patient has a turbid urine but this may come from other conditions than prostatic obstruction If in addition to the above we find a big prostate or a considerable residual urine, it is fair to make a tentative diagnosis of an epididymitis that is secondary to an infected residual

It is not necessary for me to remind you that it is quite possible, even common, to have bladder

were negative He was salivated and at night had to tie a towel about his neck as he drooled a great deal during his sleep This man had a most suggestive pallor He was found to have a blood pressure of 160, a bladder that was well up to his umbilicus, and a residual of 40 ounces His bladder was opened under novocain and drained for a time His digestive symptoms improved within a short time and his salivation ceased Later a prostatectomy was done successfully This patient was last seen 11 years later, in good general condition, but with a urine that was not clear

At the time I opened this patient's bladder his haemoglobin was 30 per cent (Sahli) reds, 3,816,010, whites 11,400, marked achromia, no stippling, no blasts, or parasites A few days later his haemoglobin was 50 per cent Three weeks after operation this patient's haemoglobin was 63 per cent and there was very slight achromia The medical consultant who saw this patient with me insisted that his secondary anemia was due to a carcinoma of his stomach and it was a long time before he could be convinced that it was purely a case of "cachexia urinaria," due to prostatic obstruction

A man of 63, seen last summer, had had difficulty in urination with some frequency for two months He was nauseated, had more or less vomiting and diarrhea He was advised that he had indigestion due to bad teeth and that he ought to have them removed, so he had 17 extracted He waited for his mouth to heal but even after that had taken place there was no relief of his nausea Another doctor passed a catheter and removed 2 quarts of transparent urine When he came under my care his bladder was nearly up to his umbilicus, his urine transparent, his prostate, large, rounded, elastic, B P 208/134, his NPN 46 5 mg His bladder was drained for some days by the decompression method with an inlying catheter and then by a cystostomy for some little time Later his prostate was enucleated under spinal anesthesia He made a good recovery and has been free of digestive symptoms

While cases of prostatic obstruction do not present this picture commonly I have seen in the aggregate a considerable number of similar cases In none of these cases has there been an absolute absence of all urinary symptoms but in all there has been such a preponderance of symptoms referred to the alimentary tract as to mislead the practitioners who saw the patients at first, and to lead them to believe that the urinary symptoms were dependent upon the digestive trouble and were of secondary importance In these cases the symptoms have differed sufficiently from those ordinarily seen in cases of prostatic obstruction as to have been wrongly interpreted at first and the disease allowed to progress to a much more advanced stage than would otherwise have been allowed had the underlying condition been recognized earlier The fact that many of these patients have a non-infected urine, which in my experience has been the rule, though not without its exceptions, has undoubtedly been a factor that has helped to mislead

The diagnosis in this condition will usually be easy if one will but remember that digestive symptoms in middle aged or older men are now and again due to renal back pressure from an over distended bladder One should always bear this in mind, in patients of prostatic age, who do not get relief of digestive symptoms under appropriate treatment The palpation of the suprapubic region will ordinarily show a tumor, easily recognized as a full bladder, to which may often be added on rectal examination the evidence of an enlarged prostate

In certain other instances of prostatic obstruction we have both subjective and objective urinary symptoms to be sure, but not the ones that are most commonly seen in cases of prostatic obstruction, not those that speak strongly for bladder irritation There may be moderate frequency and a rather slow stream but there is no pain, no straining, and usually no great difficulty in voiding I refer to a certain number of patients, who having reached the prostatic age, begin to wet the bed, in some instances to have incontinence when they take a nap, even when sitting in a chair This is a certain modification of the so-called incontinence of overflow or paradoxical incontinence in that it does not occur when the patient is awake It presumably depends on a bladder that is moderately non-sensitive, since its overdistension is unattended with pain but yet a bladder in which it is nevertheless necessary to exercise a certain degree of voluntary control, sometimes apparently more or less unconsciously, in order to avoid incontinence In the first and second of the reported cases of "dyspepsia urinaria" this condition was present to a slight degree, but its significance had been overlooked in the face of the predominance of digestive symptoms I will relate briefly a few instances where nocturnal incontinence has been the striking symptom in cases of prostatic obstruction

A cardiac of 51, seen in 1919, began one and one-half years before I saw him to have nocturnal incontinence This was not attended with any bladder pain and he did not have this incontinence all the time During this year and a half he had also had on three occasions attacks of what were supposed to be severe colds attended with chills They kept him in bed for some weeks A lot of pus had been found in his urine at the time of these attacks but on the other hand he had to get up but once at night though he had had some difficulty in voiding By rectum no increase in size of his prostate had been made out On abdominal palpation this man was found to have a bladder that was practically up to his umbilicus. His chief subjective symptom was incontinence, though he did at times have some straining on

prevent a fatal toxaemia this must be fought actively by the use of salt solution under the skin or intravenously, often up to the point of beginning oedema, the oedema is usually first noticed in the scrotum This use of large amounts of salt solution under the skin, often as much as 3000-4000 cc in 24 hours for some days, is carried out, on the theory, that damaged or embarrassed kidneys can extract the waste products from a very dilute blood much better than from a concentrated one In conjunction with the use of large amounts of fluid one should use such cardiac and renal stimulants as digitalis, caffein, and the like

In passing I may say that I believe these are the cases in which the two stage prostatectomy is of especial use, allowing the patient first to get his renal function straightened out before one subjects him to the trauma and shock of the removal of his prostate, even if this actually takes months, as has been the case in some patients who have come under my care. The use of local and spinal anesthesia has proved itself of the greatest advantage, in my hands, in caring for cases of the first two types

The third type, the type with epididymitis, is not so important as the other two, although in the case that I reported, a frail old man, this process, which went on to suppuration, made a very considerable inroad in his strength

In this paper it has been my wish to call your attention to these cases of prostatic obstruction in which, due, in most instances, I believe to the lack of a normal resentment on the part of the bladder, the symptoms of prostatic obstruction differ from those that we see in the great majority of cases of this trouble and are apt to be overlooked unless one has in his mind the possibility of the occurrence of these atypical symptoms and their significance

THE VALUE OF A GRIEVANCE COMMITTEE AS A PART OF A STATE MEDICAL PRACTICE ACT*

By ORRIN SAGE WIGHTMAN, M D, NEW YORK, N Y

THE WEBB-LOOMIS bill which is the present Medical Practice Act was passed by the Legislature of the State of New York in May, 1926 The signature by Governor Smith ended a long debate as to what was necessary and suitable to place the Practice of Medicine on a higher plane and also protect the State from the irresponsible practitioners who for a period of at least 40 years, had not been properly reregistered with the Regents of the State at Albany

The statement of the passage of this Act takes but a moment but it was accomplished only after the most difficult efforts by the Regents, the Lay organizations of the State, the State Medical Society and Dr Downing the then active head of the Regents

In spite of the most active propaganda in the State Medical Society extending over a period of years, groups from various County Societies resented the idea of making any Physician reregister yearly it was undignified, it was a nuisance, it carried penalties in case a busy man forgot to re-register, it cost several dollars a year, it was humiliating, it was distinctly unpopular At this stage Dr Downing impressed upon the Medical Profession that it was the only professional group in the State who had not come under the Regents, that by re-registering for several years the State would have an accurate list of those physicians who were rightly entitled to practice that only wilful neglect to re-register yearly would entail penalty and even then the Regents could remit the fine at their discretion The die hards were never fully convinced and the Doctors never having a full 100 per cent approval, it remained for the lay groups to exercise the necessary pressure to make the State Legislature see the light While this is all past history now, it behooves those States which have a bad or vicious law at present, to remember that medical men by themselves, are bad politicians, and any movement to be popular, must have the backing of such public organizations as can act in an unbiased way, before the Lawmakers will be convinced it is good

In addition to re-registration with a yearly fee this act created a Committee on Grievances consisting of ten men This list was made up as follows Seven were appointed by the Regents from lists submitted by the Medical Society of the State of New York, the New York Homoeopathic Society and the New York State Osteopathic Society together with three members appointed by the Regents independent of such nominations

If a Physician has been convicted of a felony, he naturally goes before the Regents for a revocation of license as provided by law In other cases where his license is involved, his case is referred to a sub-committee of three members of the Grievance Committee The decision of these three is subsequently referred to the whole Grievance Committee of ten who must be unanimous in their final report.

Cases coming before the Grievance Committee are those in which charges are made under one of the four following headings

1 Fraud and deceit in the practice of medicine, or in his admission to practice

2 On the conviction of a crime or misdemeanor

*Read before the Annual Congress on Medical Education Medical Licensure and Hospitals at Chicago Ill. February 20 1929

infections that come by way of the kidney Time and again I have seen an infected urine where there had been no possibility of infection by way of the urethra Whether a well kidney can let through organisms from the blood stream or not, seems to be an unsettled question, certainly a mild infection of the kidney of the type we usually call pyelitis is often followed by a consecutive cystitis of which it is presumably the cause The probabilities are that if a bladder contains a certain amount of residual urine, perhaps only a little, as is the case in beginning prostatic obstruction, the chance of this happening is increased Once we have an infected urine it seems possible that the infection may progress down the ejaculatory ducts and involve the epididymes, as is apparently the case in other types of epididymitis

At any rate, whether my hypothesis is correct or not, one sees an occasional case in which the first real definite sign of a prostatic obstruction is an apparently causeless epididymitis, these are invariably associated in my experience with an infected urine and often with a relatively small residual

A very good example of this came under my care last September This man, who was 73 and frail, was sent in with the story that for 2 months he had been having difficulty in voiding A very few days before he came in he had had a painful swelling of his left testis that came on without evident cause, since this man had never been catheterized, nor had he ever had any venereal trouble or anything of that sort On entrance it was found that he had a very acute epididymitis His urine was turbid and contained a lot of pus By rectum he had a prostate that was rather large and slightly irregular in contour A catheter was passed and he was found to have about four ounces of infected residual urine This man was toxic from his epididymitis, which went on to suppuration, was opened and discharged for some little time He was so toxic that for some little time he had to have subpectorals of salt solution twice a day For the most part during the time he was in the hospital we kept him on constant bladder drainage After the suppurating epididymitis had healed this man showed a residual of from 2 to 4 ounces of turbid urine His condition was rather poor, and he was allowed to go home to see if he could get back a little of his strength before having his prostate removed He has not as yet returned

This is a pretty typical example of a number of patients whom I have seen with a similar condition Although they had had some difficulty in urination it had not been very great, and the first thing that led them to seek medical advice was the acutely painful swelling of one testis They have been found invariably, so far as I can remember, to have had a turbid urine and usually an enlarged prostate as well In this man the process went on to suppuration As a rule this does not happen

This whole group represents cases in which for some reason or another the striking symptoms of prostatic obstruction have not pointed to any considerable degree of bladder irritation, the usual symptom that these cases present In all there has been evidence of a certain degree of bladder irritation, but the symptoms of bladder irritation have not been the striking symptoms that have called the patient's attention to his trouble

In the first two types the underlying condition is very important to recognize as early as possible, since for the most part these patients are suffering from renal back pressure as a result of bladders overdistended with a non-infected urine, often of light gravity This is the type of patient in whom the relief of the residual is attended with a considerable amount of danger This danger is due in part to the fact that a kidney that has been working against backpressure for a considerable time, shows a great liability to a passive congestion, even to a degree that threatens and some times produces anuria at the time the backpressure is relieved, especially if this is relieved suddenly

To this crippling of the renal function due to passive congestion as a result of the relief of backpressure, may be added an acute renal infection which will add to the crippling of the renal function these patients with an uninfected urine have not the immunity that patients who have had a slight bladder infection seem to possess These are the patients in whom one has to consider most carefully the wisest method of relieving the overdistended bladder One's object is to do this without, on the one hand, producing a passive congestion of the kidneys due to the sudden taking away of this back pressure, or on the other hand the introduction of an infection that may produce an anuria of inflammatory origin due to an active congestion of the kidneys The careful letting down of the pressure in the overdistended bladder, by inserting an inlying catheter and letting the patient slowly empty his bladder against a certain amount of gravity, the so-called method of decompression, is I believe a great safeguard against the danger of passive congestion

The danger of the active congestion due to renal infection must be combatted by as scrupulous a use of asepsis technique as it is possible for one to observe, this without regard as to whether one uses the gradual way of relieving renal back pressure by employing the so-called "decompressing" method or the quicker method by opening the bladder suprapubically under local anesthesia and the introduction of a large drainage tube.

In spite of the exercise of the greatest care of which I am capable I see a certain number of instances in which, because of one or the other of the reasons just mentioned, the congestion following the relief of urinary backpressure leads to a marked diminution of the urinary output To

ticularly as the institution was making $600,000 a year This case was properly prosecuted, and the institution was put out of business, and in spite of repeated effort, has not been able to re-open

It is unfortunate that institutes of this character are able even for a time to evade the law, but with the money in hand they have endeavored by securing the ablest counsel, to keep their work active, until large numbers of the community have been fleeced Under the present law in New York State they are bound to come to grief, and in future will be slow to risk the necessary capital, when failure is inevitable Naturally these healers scan the chances of success before they begin, but the securing of a number of convictions, and the closing of these places, has had a most remarkably deterrent effect on the starting of others

The Press likewise have been convinced that in the long run, honesty serves the whole people best Hence the editors are now looking to the organized medical profession for an opinion, before venturing to take advertisements of a questionable character This is as it should be, for the Press is as much a servant of the people as is the Medical Profession

In the beginning the managers of the radio stations were not convinced they were doing wrong in renting their facilities to anyone who was within the law But after a number of convictions they began to scan the subject very carefully and we believe they have arrived at about the same conclusion as the Press

The matters which are brought to the attention of the Grievance Committee in conference are of so varying a type that up to the first of the present year, the Sub-Committee working in the New York City area felt that its sessions should not be open to the public and the Press as public hearings While under the Act the Committee can make such laws as it chooses in the conduct of a hearing, there seemed some doubt as to whether it could be carried to the point of a closed hearing The members of the Committee felt that many charges were without foundation, that if a Doctor's name appeared in print even on false charges, once it had been in the headlines the doctor had no way of regaining his reputation even though a retraction was made later Everybody likes to read scandal, but few take the trouble to make a mental note of its correction This early action caused a good deal of criticism in one of the City Journals, and on advice of Counsel the Committee now have its hearings open except where there is justification in excluding the public according to the accepted ruling of the regular Courts

Fortunately the Act specifically states that the Committee is not governed by the regular laws of evidence as applied to Courts in general Many times it is confronted with a mass of desirable information which could not be ordinarily admitted but which is pertinent to the case Although exceptions are often taken by Counsel to the admission of this evidence, it is a very necessary provision in the law as latitude should be incorporated in any law made for the enforcement of Medical practice At times, following the procedure of other courts, shrewd lawyers have a way of viewing with complacency the disappearance of necessary witnesses In order to bring the facts which such a witness would naturally present to the Committee, this evidence must be taken in an indirect way, with the regular objection that it is irrelevant, immaterial, etc, by defending counsel

The idea of the Grievance Court is to administer justice both to physician and the public, and where technicalities are injected in order to obstruct this the latitude and powers of the Court are of great value in overruling a quibble

Aside from a Court of Appeal the Grievance Committee is enabled to save many a Doctors' reputation by discreet advice as to his future behavior Where he has used bad judgment and either by blatant advertising or false claims secured unethical publicity, he has been guided in the right direction, and as a result he has desisted from questionable methods or rewritten his advertisements in a way which would not offend

Another valuable feature of the Grievance Committee is the arbitration clause which submits a controversy between Doctors to this Committee The Decision of the Committee is final and binding in a Court of Law This may particularly apply where there is some misunderstanding as to business and financial arrangements In one case a physician had spent several months in Europe leaving his practice in the hands of a confrere On his return there were misunderstandings as to finances and a civil suit was threatened

There is no doubt but that the judicial power of a Grievance Court has a very deterrent effect upon those who contract to do or actually carry out abortions Under Section 1264, sub-division (e), the law specifically states "that a physician did undertake or engage in any manner or by any means whatsoever to procure or to perform, etc" This provision of the law gives the Committee greater latitude in its interpretation of "undertaking and engaging" Cases which have been brought to our attention are offenders who have felt that the technical construction of the law would leave them an easy loophole in case of prosecution We feel that this situation is changing for the better

Our law provides in the nature of disciplinary measures that a physician may have his license revoked, or he may be suspended from practice, or his license may be annulled, or he may be reprimanded or disciplined These grades of punishment deserve careful consideration *Revocation* comes as a harsh measure after the time and money spent upon a medical education It takes away a man's livelihood, as physicians are proverbially bad business men and are seldom suited

3 Being a habitual drunkard or drug addict, or where the physician has become insane

4 For undertaking or offering to perform criminal abortions

In order to start revocation proceedings, charges may be drawn by anyone These are then investigated by the Attorney General's Office, who renders an opinion as to whether they are meritorious If so, they are filed and a copy served on the accused physician, with a ten days notice of hearing before the sub-committee

At this hearing testimony is taken by the Court stenographer This testimony is reviewed by the sub-committee whose members make their findings for hearing before the full Committee The unanimous report of the full Committee then goes to the Regents The Regents make the final report The Physician however has the right of appeal to the Courts and if he cares to, having the final report of the Regents reviewed The Physician is thereby thoroughly protected, first, by the need of a unanimous agreement of his guilt by the entire Grievance Committee, and again in his right of final appeal to the Courts This is as it should be, since his license to practice medicine is at stake

The functions of the Grievance Committee have often been misunderstood, as many have thought that it was a prosecuting body This is not so It merely receives the proper complaints through the Regents and then sits as a Court The testimony however is regularly taken so as to be in proper form and suitable for review by the regular Courts, if such a course becomes necessary Another task however has devolved upon the Grievance Committee in cases where patients think they have a real grievance against a physician Patients sometimes complain that they have been neglected when upon proper enquiry it has developed that physicians have not used tact or have bluntly antagonized them Again patients sometimes refused to follow doctors orders, or even co-operate, and then have tried to hold the physicians accountable A request for the appearance of both physician and patient before the Committee has usually resulted in a better mutual understanding, with the result that the matter is kept out of the courts and the physician spared very undesirable publicity The people are not always the offenders When medical men perform their duties in a half-hearted way, or do not seem to take a deep interest in their cases, the patients too often interpret this as neglect, and disregarding the scientific limitations of medicine, take the medical profession to task for bad practice More than one doctor has been brought up with a round turn, to his own enlightenment, and with a deeper responsibility toward his patient

Classes of illegal practitioners who are immediately affected by the creation of a Grievance Committee are the chiropractors, naturopaths, men without licenses, foreign physicians who cannot obtain a license, bone setters, and men who in the field of optometry and chiropody are quietly practicing medicine under cover Many of these have been driven from the State, and Dr Rypins, Secretary of the Board of Regents, assures me that his estimate of 1,000 scattered into adjoining States is not an exaggeration This may not be an act of brotherly love, but it will inspire one's neighbors with the desirability and need of more stringent protective laws in their own States

In the defense offered by illegal practitioners, the report of Mr Sol Ullman, our efficient Deputy Attorney General has brought out a number of peculiar lines of argument Among the excuses offered there are general denials, partial admissions, acknowledgment of having given treatment but disclaiming making a diagnosis, or in abortions the treatments were given because of a local infection, or an old tear or abrasion In all of these cases the physicians sitting as a Court have not been deceived

To show the need of a Grievance Committee or some authorized department who may have a control of these abuses I quote from the Department of Education for the year 1928

From January 1st, 1928, to September 1st, 1928, 638 complaints were made against unlicensed practitioners Of that number 229 quacks were stopped without prosecution 98 were prosecuted of whom 44 were convicted 1 acquittal 41 are awaiting trial 12 were withdrawn, while the remaining complaints were awaiting further consideration and action The New York City Bureau of the Attorney General's Office had 27 convictions, out of 44 guilty

These figures are sufficient to convince the public that the Act is working for the common good The medical profession is alive to the fact that infractions of the law will not be tolerated

The Regents often have to deal with the human equation in men who have not the natural background for the successful practice of medicine Like men in every other profession, they may not recognize this, and so when they find they have not been a success, they assume some shady method of securing a livelihood They may connive or contract to do an abortion Men in their neighborhoods seem to be successful and escape the law, why not they? Others, as age overtakes them and practice dwindles, lend their names to questionable methods, or institutions of unsavory reputations Internes come within the scope of unscrupulous lawyers, and connive at ambulance chasing Still another group have become involved in the falsification of compensation cases

A flagrant case was that of a group of illegal practitioners who opened a House of Health They advertised by radio, and employed so-called physicians who were addressed as Doctor but had no other qualification to practice medicine than a speaking knowledge of a foreign language. What emigrant entering a busy pretentious suite of offices would not be impressed with this, par-

THE WORKMEN'S COMPENSATION LAW

By JAMES N VANDER VEER, M D., ALBANY, N Y

THERE has been so much debate and acrimonious discussion relative to the working out of the Workmen's Compensation Law, and frequent questions arising, coupled with the recenf investigation by Prof Lindsay Rogers as a Moreland investigator, that it would seem trite to again bring the attention of the profession to the provision of the law as it now stands and the workings of the same

In 1913 the law came into existence as Chapter 816 It has been amended from time to time and is now known as Chapter 67 of the consolidated laws

Its reasons for coming into being are manifold, chief ones being * * 1 Formerly there was no protection to workmen, save in the courts, through a right of action to recover damages for injuries or death Some employers in these earlier days carried protective insurance with commercial companies for such emergencies, but the vast majority did not, and the injured workman became in many instances an occupant of a charity bed in a hospital Here he was given reasonable care by the surgeon on service or his assistants, at no expense to himself, but as a burden to the community through taxation for hospital support, and on the surgeon and later on the physician as a burden for charity service, and perhaps ultimately became a further burden to the community as the occupant of an alms house In most instances if incapacitated for further work he was discharged by his employer and thus had little, if any, means of further support

In but few instances did the contract with the insurance company carry the burden far, or was the physician or nurse remunerated, and in fewer instances did the injured workman receive compensation after hospital discharge.

In many cases where the workman attempted in honesty to pay his own way, his slender savings were soon exhausted and he, with his family, became dependent on charity

Where suits were started against negligent employers, who were culpable without question, the final awards were many times consumed in costly litigation and expert fees, with no resultant benefit to the person injured, and he was left in his original position of having to depend on the charity of the community, his relatives, or the state, for a mere livelihood to the end of his days

Those of us who have been in the profession long enough can recall many instances of this nature, and even to this day some of these examples may be seen in our midst

Having such conditions in mind and with the trend of the times to provide more adequately for the possible eventual dependents of the state, the law in its various amended forms has become a fixture on our statute books, and in its general provisions seems to be satisfactory in theory to the public at large

Section 19 of Article 1 of the Constitution is that under which the law was drawn. This section reads as follows

"Nothing contained in this constituution shall be construed to limit the power of the legislature to enact laws for the protection of the lives, health, or safety of employees, or for the payment either by employers, or by employers and employees or otherwise, either directly or through a state or other system of insurance or otherwise, of compensation for injuries to employees or for death of employees resulting from such injuries without regard to fault as a cause thereof, except where the injury is occasioned by the willful intention of the injured employee to bring about the injury or death of himself or of another, or where the injury results solely from the intoxication of the injured employee while on duty, or for the adjustment, determination and settlement, with or without trial by jury, of issues which may arise under such legislation, or to provide that the right of such compensation, and the remedy therefor shall be exclusive of all other rights and remedies for injuries to employees or for death resulting from such injuries, or to provide that the amount of such compensation for death shall not exceed a fixed or determinable sum, provided that all moneys paid by an employer to his employees or their legal representatives, by reason of the enactment of any of the laws herein authorized, shall be held to be a proper charge in the cost of operating the business of the employer"

The law attempts to set up a just governing board, a department of labor which shall make rules and regulations to bring together the parties involved in every way and adjust the differences which may arise, between employer, employee, insurance carrier, expenses incurred in hospital, professional services of physicians, nurses, physiotherapists and others, and for appliances which must be furnished in after-care, and for the welfare and keep of the permanently injured person after discharge by the physician and his return to society at large

Its provisions govern only "accidental injuries arising out of and in the course of employment and such disease or infection as may naturally and unavoidably result therefrom"

In many rules of the referees and the courts the above section has been construed broadly, and under the approval of the Appellate Division and the Court of Appeals "an accident is an unlooked for mishap or an untoward event which is not expected or designed, being limited so that an act done deliberately and willfully by a third

to anything else The Grievance Committee makes no hasty conclusions where so serious a decision is involved

A man may be *suspended* from practice A reasonable period of time acts as an effective warning, while too long a period may spell bankruptcy

A *reprimand* before the whole Grievance Committee may be of value but is doubly so when accompanied by the necessary publicity

Discipline may include keeping the case under observation with the promise of more serious consequences unless a radical change is made by the physician In this series of measures the law provides a pretty effective weapon for the control of the wayward physician Fortunately there are comparatively few But the fact that there is a law which works is the best sort of a deterrent to a prospective wrongdoer

The scope of the work of the Grievance Committee is gradually widening The law in its broader interpretation has been utilized to enter fields of wrong doing which were not even suspected at the beginning of the Committee's work The connection of the Doctor with unscrupulous lawyers in accident and ambulance cases is one of moment Another is the possibility of complicity in compensation cases Both of these issues are now before the Committee, but as they are in the process of trial we cannot yet announce any results There are apparently, however, evils enough present to require radical correction

In summing up I should say a Grievance Committee is an excellent provision to have been incorporated in the law It requires an active Board of Regents in its State Department of Education who shall be alive and co-operate in every way, such as we have in New York State

It requires the selection of physicians who are conscientious and unselfish in the performance of their duties At the present time there is no remuneration for the members of the Grievance Committee and the outlay in time and expense, where one day a week has been given to the work, is a great deal to ask of any busy physician. The members must be irreproachable in character as it is surprising how many indirect ways are employed to use influence when a physician falls under the ban of the law In the matter of expense, —while the State is supposed to pay travelling expenses with a trifle added in the event the meetings are held away from home,—the fact is that like all well organized State finances the money of the department is difficult of approach and so complicated in recovery that the Committee assigns the greater part of the cost of this work to their "profit and loss column" I refer especially to the personal outlays necessary in meetings of this character

New York State would be very glad to confer with any other State contemplating an improvement in the enforcement of a Medical Practice Act By communication with the Secretary of the Department of Regents at Albany or with the Attorney General's Office in New York City I feel that full co-operation would be given as to the progress of our work to date

Our experience has led us to believe that the legal practice of medicine in New York has very much improved since the passage of this Act in 1926

in the upper right hand part just before the word "Report"—if the case is to last very long *But* do not forget to send a "Final" report when the case is finished This should be sent with the bill, if the insurance lies in the State Fund (and is forwarded with form M-28 (the green form), or can be sent direct If the insurance is with another carrier a sworn copy should be sent of form C-4 "Final Report" with your own bill attached, at the termination of the case and if the case is a long one at least every sixty days

Do not hesitate *to attach an extra sheet at any time to any blank sent in,* as the Industrial Commissioner, referee, departmental clerk, departmental physician, or insurance carrier, is anxious to obtain ALL the information possible as to the injury received, and if your bill seems excessive, an attached explanation many times facilitates payment and obviates delay and irritation Don't leave it to a hospital interne or assistant Make out the forms yourself and thus make sure it has been done

b Always send a copy of every form C-4 to the employer Many times his main office does not know until days later that an employee has been injured With this copy send the written request for treatment, as mentioned above, that he forward to you at once an order to treat the patient from then on, or a notice for you to cease treatment A regular printed form is best, if one does much of such work A letter request however is sufficient

If you receive an order to continue treatment, keep it for forwarding with your bill later, as that is your evidence that you have, in good faith, furnished attendance.

If you receive an order to cease treatment, close the case as hereinafter described, for the employer at present under the law, is the only one who has the right to choose the physician, and that right must be observed legally

c. Send always, a copy of every form C-4 made out to the employee He is entitled to know just what you think of his case, and to see what he said to you as to how the injury happened, and how you described it on the blank This may have its objections but it will obviate much discussion later

d Always keep a copy of every form C-4 sent out, and a list of those to whom other copies have been sent. In this way you are always positive of what you have sworn to previously, and there can be no cause for confusion to the examiners who look over the cases, or to anyone else concerned in the case, as the forms of the same date should agree in every particular

By paying strict attention to the above and notifying the Department, the employer and the insurance carrier, you will have established the links of notification required by the law Unless you start right, you will receive scant consideration from then on.

2 If any change occurs in the patient's condition, except that of betterment, and you are still legally retained by the employer to continue treatment, be sure and send out another set of C-4 forms, for all hands are entitled to know how the case is progressing, for their own records You are required to do this under the law, at least every sixty days, and because of non-fulfillment of this provision is why so many payments for services rendered are held up

Naturally the Department or an insurance company cannot pay a bill unless it knows just how the case is progressing, and as the medical attendant you have your rights in the matter, and they have certain rights also

Any disagreements must be settled later, or only upon your being discharged from the case, as it is with any private patient

It is well to head intermediate reports as "Supplementary" or "Intermediate" reports that all may know how the case progresses, and the dates of these reports show their sequence

Again, don't hesitate to clip an extra sheet to each copy (and save one for your own copy) if you can describe more fully the changes that have taken place and there is not sufficient room given on the blank These extra reports must be sent at least every sixty days

3 When the case is finished and you have discharged the patient make out a "FINAL" set of C-4 reports and send them as you did in No 1

If the insurance lies with the State Insurance Fund, then to the original sworn C-4 "FINAL REPORT" attach your bill, which should be made out on form M-28, the green blank On the back of this is room for making explanatory remarks, but do not hesitate to use an extra sheet if it is necessary to explain more thoroughly how the case has terminated Give all the information you can to make it clear Keep a copy of this bill for your files

If the insurance lies with a commercial carrier, many of them have special forms for the rendering of bills, but if you send your own bill they will probably return to you one of their forms for filling out.

Your charges should be those "as prevail in the same community for similar treatment of injured persons of a like standard of living" (Chap 2, Section 13) and "claims for services or treatment rendered or supplies furnished pursuant to Section 13 of this Chapter, shall not be enforceable unless approved by the Board" (Chapter 2, Section 24)

It is to be remembered that many of these injured employees were formerly treated as charity patients in the charity wards of our hospitals, for which the physician received no pay, BUT, it is also to be remembered on the part of the physician that the so-called "fee bill" which was made in about 1914 is a minimum fee bill, and not a maximum for persons who would have paid more to a

party may be an accident from the viewpoint of employer and employee"

As an example of some decisions under the above construction are cases of poisoning from eating food provided by an employer, or typhoid fever ensuing from drinking polluted water, and so forth

Definitions relating to the law and to the terms used therein, and the regulations thereunder, are clearly set forth, and the groups under which the workmen are classified as employees are being constantly augmented and enlarged from year to year by legislative enactments, by new court rulings, and by new regulations,—which only points out that eventually the *fulfillment* of the law must approximate in 100% the *theory* of the law, and *all persons* who work for others, in a gainful way will be insured,—even as to the professional assistants of our physician's group In this manner we are tending more and more toward a type of pension system for injured employees in this state

In its application each and every employer whose work falls under the various groups as in the law, must cover his employees by insurance, either in a commercial company, a mutual company authorized to transact the business of Workmen's Compensation insurance in this state, the State Insurance Fund, or by self insurance under terms satisfactory to the Industrial Commissioner

It is not generally understood that house servants fall under the provisions of this Compensation Act

Every insurance contract must contain a provision giving the Industrial Commissioner the right to enforce the payments levied under the insurance contract

The State Insurance Fund is a creation of an insurance fund consisting of the "premiums received and paid into the fund, of property and securities acquired by and through the use of moneys belonging to the fund and of interest earned upon moneys belonging to the fund and deposited or invested as herein provided"

It pays the losses sustained through insurance, and the expenses of administration, and is administered by the Industrial Commissioner

Under the regulations there are established referees who hear and determine the extent of damages to be awarded, subject to certain limiting provisions There are of necessity certain forms (Section 124) as required by an employer to notify the Industrial Commissioner of a compensable accident, also blank forms as are necessary for *proving injury, death, medical or other attendance or treatment,* and these same forms are now carried by the insurance carrier and not by the employer as formerly

It is with such forms as the above that the physician must deal, and he should constantly keep on hand, Form C-4 (the pink blank) which is the notification blank, and which must be rendered to the insurance fund by the physician before the 20th day after the accident, if cognizance is to be taken by the state department that he is the accredited attendant upon the case

Also Form M-28 (the green blank) which is to be rendered to the state insurance fund as the itemized bill at least at the end of every sixty days if the case is continued, if the insurance lies with the State Insurance Fund, and if the case ceases to be under the care of the original physician

Many insurance carriers have special forms and bill heads of their own, so it is wise for the physician to have printed a stated notice somewhat like the following which should be sent to the employer, or the insurance company if known with the first report of the case that is sent out

This should read somewhat as follows "Please take note that on , an employee of yours, (name and address), was treated at this office for an injury of , and stated he was in your employ when the accident occurred Pursuant to the Workman's Compensation Law will you please fill out the attached form below and return it to me, or send me an Order for Treatment, with such proper and necessary state forms as are required by law To do so promptly will be of service to us all Sincerely,"

At the bottom is a detachable sheet which should read somewhat as follows "I hereby acknowledge the receipt of the above notice and am inclosing the proper state forms to be filled out by you and forwarded according to law in the case of (name and address) an employee of mine and now under your care My insurance carrier is Represented by The employee's wages are $ per His identification is check No , Date And room for signature of employer or his representative

In order to collect a bill, under the law, from an insurance company or the State Insurance Fund, it is incumbent upon the physician to file an "Order for Treatment" from the employer (Not from the Insurance Carrier) authorizing that the physician treat the injured man

The employer is the one who selects the physician and not the insurance company, under the law

This should be borne in mind by every physician

In order to clarify the procedure of a compensation case the physician should 1 So soon as he has given treatment to the case, sit down and fill out completely the original and three copies of the C-4 (pink) blank and send them as follows—after swearing to the original copy

a One to the State Insurance Fund (the original), at the nearest branch office as shown at the top of the blank *Be sure to comply with each question, even on the back of the blank*

It is well to incorporate the word "Preliminary"

EDITORIAL

NEW YORK STATE JOURNAL OF MEDICINE

Published by the Medical Society of the State of New York under the auspices of the Committee on Publication

Business and Editorial Office—2 East 103rd Street, New York, N Y Telephone, Atwater 5058

The Medical Society of the State of New York is not responsible for views or statements outside of its own authoritative actions published in the JOURNAL. Views expressed in the various departments of the JOURNAL represent the views of the writers.

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see March 15 issue, advertising page XXXI

COUNTY SOCIETIES PRACTICING CIVIC MEDICINE

County Medical Societies are taking an increasing interest in public health, and are assuming the leadership in the practice of civic medicine The Dutchess-Putnam Medical Society spent a whole session in the consideration of the water supply of Poughkeepsie, and the Tioga County Society devoted a meeting to a proposed county hospital Descriptions of these meetings, which are printed on page 413, are examples of practical reports which this JOURNAL should receive in increasing numbers from State Society officers and Secretaries of County Societies

private physician in the same capacity, and that appeal is always possible to the Industrial Commissioner, and the Board, for a review as to the propriety of the charges made, and if they are not applicable to the "An injured person of a like standard of living"

It must be recognized also that some physicians maintain expensive and very up-to-date offices in small cities and towns, and that offices in the larger cities are more expensive to maintain than in the towns and country—and no reasonable bill would be thrown out entirely if the case was a serious one, had received the benefit of excellent judgment and handling, and was returned to work in a shorter period than the average time of the statistics on file in the Commissioner's office

A word in regard to consultants Naturally the aim of the Department and of an insurance carrier, and of the physician as well, is to return the patient, employee, to work as soon as possible Therefore it is far better for one who is not skilled in the care of a particular injury, to seek permission of the employer, to transfer the case to another physician's care, or to be empowered to have consultation The employer is the one who has the power under the law to authorize this, but a referee of the Department may order such done, though not naming the consultant, if it is deemed that the case is not progressing as well as it should

It is far more a credit to the physician, in the eyes of the Department, of the employer, and of the insurance carrier, if by transference or consultation, a case such as that of tendon transplantation may be done and thus an amputation be avoided, and such a move would redound more to the credit of the physicians in general, than where unnecessary and perhaps unskilled surgery might be attempted

While the questions now at issue, and in dis- agreement between the various parties concerned, relative to the present workings of the law, are being handled by the "Special Committee on Workmen's Compensation," of which Dr W Warren Britt of Tonawanda is Chairman, and for which a favorable outcome is so earnestly hoped by your State Medical Society officials and physicians in general throughout the state, it must necessarily be recognized that this law as now is, is on the books, and that fighting changes in it can only be done in a recognized concerted way

So long as it maintains in its present form, physicians can expedite the cases which they treat by following out the law as explained above

That the physicians of this State may be the better schooled in the text of the law the following sections are hereby incorporated for reference. *Copies of the law may be obtained from* the Industrial Commissioner

Section 13 has to do with the treatment and care of injured employees

Section 19 has to do with the physical examination of the employee at the hands of the Department.

Section 19a forbids any of the Departmental physicians or surgeons from receiving a fee.

Section 19b forbids any of the departmental physicians or surgeons from giving treatment outside or within the department, or recommending that any special physician or surgeon be employed But the employer must obtain such treatment as recommended within five days for the employee

Section 23 has to do with appeals in every form

Section 24 has to do with the costs and the fees

Section 41 has to do with the appointment of examining physicians

Section 110 has to do with the record and report of injuries given by the employer

and committeemen in New York State send clippings from newspapers These are nearly always excellent, provided the officers and speakers at the meetings have taken pains to tell the newspaper reporters what has happened A reporter would be fired from a newspaper if he did not record in one concise paragraph the who, what, when and where of the meeting, and give a summary of the important subject that was discussed A reporter may be brutally frank in what he says, but if he is, the reason is likely to be that the speakers missed constructive points as they made destructive criticisms regarding the subject under discussion

When an editor writes up a meeting or conference, he follows exactly the same method of an expert physician with a patient

First he takes a history and makes a physical examination in order to obtain *facts*

Second he analyzes his facts and compares and weighs them in order to make a *diagnosis,* which in the case of a report of a conference consists largely in determining what the speaker is driving at and what the discussers think of his points

Third, the editor develops a plan of *therapeutics,* for what the patient wants to know is what the doctor advises him to do The editor will deduce the action which seems to be the consensus of opinion of the speakers

The object of the report of a conference is to influence the actions of the members If a short snappy report in a Journal arouses either interest or action in the members, it has fulfilled its object

INDEXING SOCIETY ACTIVITIES

Last December the question of utilizing the reports of the Medical Society Activities was discussed in the Council of the Medical Society of the State of New York, and it was the unanimous opinion of the members that a current index of the reports would be of great value in enabling anyone to ascertain what action the societies have taken, or what plans have been adopted or suggested Accordingly a two page index covering the first three months of the year has been prepared and is published on page 411 of this Journal An index of the second quarter will be published on July first

If the index contains no reference to the activity of any particular committee, the reason is that no report has been received from that committee, and on the other hand, if any committee has received noticeable publicity, it is because reports of its activities have been sent to the Journal The index also contains references to abstracts of the activities of the Medical Societies of other states

LOOKING BACKWARDS

THIS JOURNAL TWENTY-FIVE YEARS AGO

Criticizing Brother Doctors We wonder if the year 1929 could witness a repetition of the following incident recorded in this JOURNAL of April, 1904

"The following letter was received by a prominent specialist of New York City from a citizen of prominence and means of a western city, whose son he had treated, in response to a letter requesting payment for his services, no attention having been paid to his bill, which had previously been rendered

"Dear Sir—Your letter of the 9th inst came to hand in due course of mail I have taken a little time, because I wanted to have your bill submitted to some specialist in New York City, and I have a friend living in your city to whom I wrote, requesting that the bill be submitted to some specialist there, and he now writes me that the specialist says that it is not usual where a person comes to the office for a course of treatment for the doctor to charge $5 after the first visit for each treatment, and the consensus of opinion from the specialists consulted was that your bill was just about double what it should be

"You say 'Of course, if you are not actually able to pay my fee, I would be very glad to assist you, but this is not the case'

"In reply to that I would say that I am not a pauper, neither am I a millionaire, but I regard your bill as excessive, and if you would reduce it to about one-half of the amount that you charged I think the matter could be adjusted without much difficulty"

"I do not believe that if I lived in New York City you would have rendered any such bill as you have I feel certain, doctor, that you ought to readjust your bill

Yours respectfully,

REPORTING MEDICAL SOCIETY NEWS

State medical journals are organs of the medical societies of the states and their constituent county societies They are the natural repositories of the proceedings of those societies, and fulfill their functions best when their records are accessible and understandable Records well written and indexed would save the officers and committeemen the repetition of plans tried long ago and abandoned, only to be taken up again as novel ideas when a new set of officers takes charge of the societies There is a cycle of plans recurring every five to ten years because the proceedings of the societies are either not recorded or are not read

It is one of the duties of an editor of a state journal to read the journals of the other states in order to learn what the other societies are doing, and to bring new ideas to the attention of the officers, committeemen, and members of his own state society There are abundant precedents and experiences available to any officer who wishes to learn how to perform his duties, for some state or county has probably tried the same plan and has buried its record in a routine report where its identity is unsuspected It is the work of the editor to dig out those records, abstract them for his own journal, and finally to index them so that they may be available No one can blame the officers and committeemen for failing to discover the buried records if the editor does not take the steps to make their discovery easy

THE NEW YORK STATE JOURNAL OF MEDICINE has made a serious attempt to index the medical society records that have appeared in its pages during 1928 It has also sent reprints of its index to the editors and secretaries of the other State Journals, because items are abstracted from other State Journals to an extent far greater than their editors may realize The index seems to be the first attempt at taking stock of what the other State Journals are doing But besides indexes, there are two other important factors in recording the proceedings of the medical societies of the states and the counties

1 Securing news, or reporting
2 Putting the news in readable form, or editing

Few state journals have an efficient system of news reporting New Jersey and some other states have county society reporters, but no state appears to have a complete system of reporters of the activities of the state societies An analysis of what is required will help to establish a diagnosis on which efficient therapeutics may be based

Two systems of reporting are in common use

1 The stenographic
2 The interpretative

Some State Journals make a practice of printing full stenographic reports of important meetings and conferences, often devoting as much as thirty pages to a single conference A report of this size will contain 25,000 words, and at 120 words per minute, it has taken the speakers 200 minutes, or over three hours, to deliver the talks, and it will take a reader an equal number of hours to read them It is hardly to be expected that any one will devote that amount of time to the average Medical Journal

However, stenographic reports are ideal bases on which an editor may make an analysis of the remarks, and may write summaries embodying their salient feaures Verbatim reports also enable the editor to do his write-up in the quiet of his own sanctum Moreover, with the notes before him, an expert editor can quickly choose the meat of the discussions from the grist of stories and extraneous matter with which the talks are often interpolated

What the members of medical societies like to see in the State Journals is an interpretation of the talks and discussions of the meetings and conferences A subject is assigned in the program, and after the principal speaker has developed his points and suggested a plan of action, those who follow him are likely to seize upon some important phrase for comment, or they reiterate illustrations out of their own limited experiences An ideal discussion consists of intelligent questions designed to throw light on some point which the speaker has failed to impress upon his hearers It is not always the fault of either the speakers or the hearers that an important point is missed A speaker will develop many points, and it is beyond reasonable expectation that his hearers will grasp them all in a well rounded impression which the speaker intends to convey It is the work of the editor to take the strenographic notes, and with the program in mind to summarize the points which the speaker has emphasized His next step is to run through the notes and see what ideas the other speakers have grasped, and their reaction to them All else is extraneous to the subject and had better be omitted In this way a three hour conference may be fully reported on a page or two which a reader may digest in five minutes

An editor is something more than a clerk who takes reports, ties them together end to end like pieces of string, and winds them around the pages of his Journal One of his great opportunities consists of writing his interpretations of meetings and conferences and recording them in a brief form which the average readers of his Journal can grasp readily and willingly It may even happen that the average members of a Medical Society may open the pages of their Journal eagerly to see what new ideas have come out of the meetings and conferences

The cry of every editor of State Medical Journals is "Give me more reports of conferences and meetings of Societies and Committees" He wants first of all to get the reports Many secretaries

back to 1910 However, three of the five were seen during 1927, which would seem to show cumulation There was no fixed type in these five cases and in only two is mentioned a thrombophlebitis *in situ* In the remainder the tonsillitis is mentioned as gangrenous, although the above-mentioned lesion is not denied and was probably present There were numerous local complications including phlegmon In summing up the 5 cases the author stresses the fact that the secondary and general symptoms outweighed those due to the actual tonsillar lesion. Chill and high temperature developed early No theory is advanced as to why such cases are so rare when in theory they should be common Treatment seems almost hopeless, for early suppurative metastases are to be looked for if the patient live long enough Bacteriology throws little light on these cases, but as a rule the patients give a history of recurrent tonsillar inflammation and doubtless tonsillectomy would have saved them—*Schweizerische medizinische Wochenschrift,* Jan 12, 1929

Active Immunization Against Diphtheria.—As is well known, Germany has been backward as regards the wholesale active immunization of children against diphtheria as guided by the Schick test. W Stoeltzner of Königsberg, like some others, believes that they will have to come to it although he takes no stock in the Schick tests for susceptibility and immunity The movement has gained great headway in America and is also taking hold in France, Russia, England, Holland, and Denmark The author witnessed the introduction of the serum treatment 30 years ago and believed that the malignant type was a thing of the past, although since 1925 we have seen cases, fortunately not many, in which serum, even in early and large dosage, was powerless It is difficult to compare this type with the old preserum malignancy For one thing the larynx is rarely involved and death is not due to strangulation but occurs, after some delay, from cardiac paralysis Our theory that the antitoxin is a definite antidote to the toxin of the disease seems to fail when 100,000 units given as early as the second day exert not the slightest influence on some of these cases Yet *in vitro* the toxin of today is readily neutralized by the antitoxin, for animals remain immune to a mixture of the two In this quandary, the author suggests, we are forced to assume that relatively huge amounts of toxin are formed so rapidly in the tissues that it is no longer possible to neutralize them There remains then but one thing to do—to resort to active immunization and without any regard to Schick testing, for the author has not found the tests trustworthy, whether positive or negative. Besides he asserts that the disease is on the increase in the United States, although evidently he is unaware that this increase is limited to some of the big cities where immunization has not come into vogue—*Deutsche medizinische Wochenschrift,* January 4, 1929

Hepatic Lesions from Barbituism.—F Tremolieres, A Tardieu, and A. Carteaud mention the group of synthetics derived from barbituric acid and their potency as hypnotics, but warn that prolonged use, or large amounts such as are sometimes taken with suicidal intent, may damage the liver and kidneys In 1927 the same authors reported two cases in point in which it appeared that the drug may be retained in the liver although the nervous system remains quite free A third and also fatal case has since been seen in a young woman who took 36 grains of veronal and died in coma. At the autopsy the naked eye appearance did not show great departures from the normal, but the viscera were turned over to a chemist who made extracts for analysis with the result that nearly 10 grains of veronal were recovered, the greater fraction from the liver As not all of the organs were included in the test it is safe to estimate that at least 15 grains had been retained in the body The histological changes in the hepatic cells are given very briefly, but some of them are certainly not to be explained by ordinary cadaveric alterations, on the contrary, they approximate those found in toxi-infectious diseases In order to get a better idea of the nature of the alteration in the hepatic cells a rabbit was progressively poisoned with the drug and similar alterations were found A practical conclusion may be that those with lesions of the liver already present should not be given any of the hypnotics of the barbituric group—*Bulletin de l'Academie de Médecine,* Dec 26, 1928

Parasitic Cirrhosis of the Liver—Professor M Askanasy of Geneva recalls that once on a time and for many years we had but one kind of hepatic cirrhosis,—that of Laënnec This was followed by the cardiac type, and when Hanot had isolated the hypertrophic type we thought we knew all there was to know of such lesions Now we have so many forms that it is difficult to keep track of them, or even to classify them satisfactorily, and among the newer types is the parasitic, in which especially the forms of schistosoma are concerned This parasitic form is rare in Europe and the United States but may be quite prevalent in such countries as Egypt, Cape Colony, Japan, etc. There are three forms of schistosoma which have been quite well dif-

MEDICAL PROGRESS

A Pathogenic Theory of Cancer—L Hirtzman begins with the subject of cell division which we know to be a result of certain forms of irritation The less the differentiation of a cell type the greater the response In cancer the process of division never stops, which fact makes us think of some specific type of irritation such as might come from a parasite A parasitic theory, however, does not stand up under criticism, and therefore we must assume that very different types of irritation are able to cause permanent cell division We may in this connection suspect some of the growth agents or enzymes or we may interject a new element—that indefinite cell division is the result of the withdrawal of some inhibitive agent, something of an incretory nature From now on we are dealing in hypotheses and results of experimentation The work of the author, along with other data, has led him to the conclusion that some feeble irritation in the course of time brings about a change in the serological properties It has been shown independently that tar cancer in addition to the local changes is also responsible for certain general disturbances, which are assumed to be due to absorption of certain substances which may or may not proceed from the cancer cells A focus of irritation may precede the appearance of cancer by many years Is it not possible that certain products in this focus are absorbed, with the result that the serological functions of the blood are compromised? In time, with the defence broken down, the focus becomes cancerous and in many cases surgical cure is prevented by metastasis or early recurrence *in situ* Such a view would combine the local and general hypotheses in one — something heretofore impossible — and would explain some of the enigmas of cancer To sum up in a few words, it is simple localized irritation of feeble character extending over long periods which creates the cancer soil This theory supplies a good basis for future experimentation—*Le Progrès Médical,* Jan 5, 1929

The Etiology and Etiological Treatment of "Plaut-Vincent's Angina."—From a review of the literature on Plaut-Vincent's angina, P Mangabeira-Albernaz concludes that the disease is produced by the fusospirochete combination, neither alone being pathogenic Microscopically there are two layers in the lesions, one a zone of necrosis, the other of inflammatory reactions The necrosis zone includes three layers, characterized by the presence of the fusiform bacillus The zone of inflammatory reaction has no fusiform bacilli, but bears great numbers of spirochetes, and these are occasionally found in the necrosis zone The therapeutic procedure necessary to meet the special conditions of this symbiotic infection must fulfil five requirements (1) The remedy employed should be absorbed to a greater or lesser extent by the tissues, (2) it should be antiseptically active for an appreciable time, not immediately resolved by contact with the tissues, as happens with hydrogen peroxide, etc , (3) it should be neither caustic nor destructive, (4) it should have a solvent action upon narcotic tissues, (5) its action should be specific on one or the other component of the symbiosis. The author's experimental work, as well as that of other investigators, has shown the value of bismuth salts He paints the ulcers daily with a salve emulsion of bismuth tartrate at 30 per cent and has the patient gargle with a mild antiseptic every two or three hours Severe cases require three treatments at most Bismuth tartrate has been employed in this way with the best results for spirochetosis in other localizations as, for example, in fusospirochetic otitis, phagedenic ulcer (ulcus tropicum), phagedenic genital cases, and erosive balanitis of Berdel and Bataille Bismuth presents many advantages over the arsenobenzols, it is less toxic, more powerful, more economical, and is immediately and certainly sedative, allaying the characteristic pain The bismuth salts locally employed are the best treatment for Plaut-Vincent's angina—*Laryngoscope,* January, 1929, xxxix, 1

Fatal Complications of Follicular Tonsillitis—Professor E Schlitter of Basle, an otolaryngologist, discusses this subject at great length It seems strange that European authorities are so silent on what is termed, in the United States, septic sore throat, which occurs chiefly in small epidemic incidence with a high mortality Instead we find not a few accounts of fatal pyemia following tonsillitis, due it appears to localized thrombophlebitis There was indeed a local epidemic of angina in Kolding, a Denmark town, in 1926, but of 2,000 cases only 12 ended fatally—nothing like our septic sore throat where the incidence is limited to a particular milk supply Claus saw 29 scattered cases of post-anginous pyemia during 10 months in a throat clinic, but on the whole the sequelæ very rare considering the frequency of tonsillitis The author reports 5 fatal cases with autopsy, the oldest going

Pseudoperitonitis and Pseudoileus—P S Babitzki of Kieff refers to conditions encountered especially in accident practice in which one or the other diagnosis is made—peritonitis or ileus—but is not borne out by the further course of the case Numerous examples are given and the lesson to be learned is that when we are apparently confronted with conditions which seem to justify such diagnoses we must always bear in mind the possibility of error The peritonitis may prove to be a reaction due to a retroperitoneal process, the ileus a reflex phenomenon, which may be determined alike by acute and chronic lesions In the latter case we may see recurrent attacks of pseudo-ileus The dilemma is a most unpleasant one for the surgeon for if peritonitis or ileus is actually present delay is out of the question as a rule The subject of reflex ileus is one which has a very large literature and from cases cited by the author it does not appear that most of these could have been anything more or less than what is known as paralytic ileus, although with this marked difference that a lesion was responsible which if it could be detected and treated would result in complete recovery This lesion might lie in the pelvis or retroperitoneal space, and consist of an abscess, hematoma, thrombophlebitis, or what not Surgical relief is followed by prompt subsidence of the reflex ileus Not all such cases are paralytic, for the author mentions some which were spastic In regard to pseudoperitonitis this agrees largely with the peritonism of French authors The two processes—peritonitis and ileus—seem at times to be associated in the same subject, and this very association may suggest the possibility of a wrong diagnosis It is evident that in making his diagnosis the surgeon should always think of the possibility of a lesion in the retroperitoneal space and endeavor so far as possible to exclude such by the clinical history and collateral symptoms—*Deutsche medizinische Wochenschrift,* Jan 18, 1929

Alcohol Injection in Angina Pectoris—William Jason Mixter and James C White add three cases of severe angina pectoris treated by alcohol injections to the five cases previously reported by James C White and Paul Dudley White This treatment is based on the theory that the pain of angina pectoris is transmitted through the rami communicantes to the spinal nerve roots and thence to the brain, and that the greater part of these painful sensations are transmitted through the upper dorsal roots The technique used was similar to that employed by Swetlow and is based on that of Labat for paravertebral anesthesia The seventh cervical and upper four dorsal spines are carefully located, and each is cautiously injected with 5 c c of 1 per cent. novocaine A separate needle is used for each injection and is left in situ After ten minutes, 5 c c of 80 per cent, alcohol is injected through each needle If Horner's syndrome and anesthesia of the skin of the chest wall do not develop, the result of the alcohol injection is somewhat doubtful Great care should be exercised to avoid injury to the pleura No one should attempt alcohol injection who has not had a large experience in paravertebral anesthesia Following injection there is a period of anesthesia As this wears off there may be painful and annoying hyperesthesia of the chest wall, which in some cases has lasted from three to four weeks This in turn wears off and the patient is free from pain The injection gave over 90 per cent relief on the side injected in three cases and partial relief in three There were no deaths or serious complications as a result of the injections The treatment is not difficult after one has mastered the technique It gives promise of being distinctly less dangerous and of giving results as good as, if not better, than sympathectomy.—*Annals of Surgery,* February, 1929, lxxxix, 2

Production of Histamin Through Irritation of the Skin—This subject is discussed by H Kalk Several investigators have already pointed out that various forms of irritation of the skin mobilize an unknown substance in the blood, some of the reactions of which suggest the presence of histamin or some allied substance, one of these reactions being an increased flow of gastric juice The author having two subjects with a strong tendency to dermographism and at the same time hypochlorhydria made some tests to the point After preliminary tests of the gastric juice to make certain of low acidity, the back and thighs were rubbed vigorously with a hard brush for 5 minutes and the stomach contents again tested It was found that 10 minutes after brushing both the quantity of juice and degree of acidity were notably increased The result, so far as the action on the gastric juice is concerned, corresponds to that produced by gastrologists by injections of histamin This phenomenon was not offset by injecting atropine, hence the unknown substance does not produce its action through the parasympathetic The reaction produced by the brush is less marked than that which follows the injection of one milligram of histamin Until proof of identity of the unknown substance with histamin is supplied, the author purposes to call it the "H Substance"—*Klinische Wochenschrift,* January 8, 1929

ferentiated clinically, yet we know that any one of them may be responsible for hepatic cirrhosis with the addition of splenomegaly which may or may not be secondary to the former The author's paper is almost entirely devoted to pathology and there are few suggestions as to clinical diagnosis or treatment Naturally in a case of hepatic cirrhosis in any of the countries mentioned the parasite should be thought of and examination of the discharges should reveal ova or parasites In early stages the spleen is normal in size and constitutional symptoms, such as anemia, fever, etc, may be absent It has been suggested that recent suspects be treated with antimony or emetine, just as arsenicals are used when we suspect syphilis as a factor But in advanced cases such therapy is bound to fail A very large spleen does not connote a high degree of liver involvement and the question of a splenomegaly may be decided on general principles as a purely surgical problem — *Schweizerische medizinische Wochenschrift*, January 19, 1929

Hepatitis and Hepatosis — Professor R Rössle seeks a parallel to the nomenclature of renal diseases which distinguishes between nephritis and nephrosis. Thus far no such attempt, if ever made, has been successful, and the literature is practically silent as to hepatoses In theory they should be characterized by a degeneration of the parenchyma In his final summary the author speaks of hepatosis as a pathological and not yet a clinical term The mass necrosis sometimes found at autopsy does not give rise to any definite clinical picture There is an acute serous and an acute hemorrhagic hepatitis while the chronic forms of the latter make up our numerous forms of cirrhosis Instead of two separate clinical pictures what we would call a hepatosis is commonly associated with a hepatitis as a secondary degeneration of the parenchyma A predominance of the hepatosis element is necessary for the development of an atrophic cirrhosis A pure hepatosis does not lead to atrophy and the most distinct type of a hepatosis—acute yellow atrophy—does not result in sclerotic processes, although we may see attempts at regeneration of the liver substance which suggests them A simple hepatitis without any element of hepatosis tends to result in hypertropic cirrhosis Naturally, there are many transitions between pure hepatitis, pure hepatosis, and a mixture of the two We know that there are poisons which are cellulotropic for liver cells and cause hepatosis, but in some of these cases involvement of the mesenchyme also leads to cirrhosis Hepatitis followed by cirrhosis may be a mere item in a general process —*Schweizerische medizinische Wochenschrift*, January 5, 1929

Fibromyositis as a Simulator of Other Maladies —George E Murray, writing in *The Lancet*, January 19, 1929, ccxvi, 5499, deplores the fact that very little attention is paid to the muscles in the standard textbooks on medicine, and hence their importance is likely to be ignored when searching for the cause of pain If fibromyositis involves the pectoral muscles it may be mistaken for angina pectoris, but the pain, unlike that of the latter, is not accompanied by a sense of constriction or the sudden fear of impending death, and is not increased by forms of exertion other than those affecting the involved muscles The immediate relief afforded by vasodilators in angina is not experienced when the pain is due to myofibrositis Careful examination of the pectoral muscles may yield positive evidence of fibrositis. Pleurisy and intermittent claudication may be simulated by fibromyositis, and when the anterior abdominal muscles are affected it often gives rise to fears of intra-abdominal disease The chief characteristic of fibrositis of the abdominal muscles is a dull aching pain, generally felt at one particular spot from which it tends to radiate It is relieved by rest in bed There is no cutaneous hyperesthesia. If firm pressure is made with the tips of the fingers at the point where the pain is felt, it will be found to be acutely tender The important point is that tenderness under the same pressure is far greater when the muscle is contracted then when it is relaxed, this is opposite to the finding when tenderness is due to some intra-abdominal disease Myofibrositis must always be considered as a possible cause of obscure pain In its prophylaxis, exposure and chilling should be avoided, and also an excess of meat and sweets in the diet Some forms are probably gouty in origin and others are secondary to focal infection At the onset of an acute attack a vapor bath at 120°F for fifteen minutes, or a bath in water as hot as can be borne, followed by rest (and this is most important), gives much relief Aspirin (5 grains) and Dover's powder may be given and repeated every four hours The application of a belladonna fomentation over the affected muscle will also help to ease the pain Another useful application is a liniment of equal parts of camphor, menthol, and chloral hydrate, or one of menthol and sodium salicylate In subacute and chronic cases iodine is useful internally and iodine and belladonna ointment locally Five grains each of guaiacum and sulphur, three times daily, or tincture of cimicifuga in a few minims of liquor potassæ, should be given In prolonged cases a course in hydrotherapy and physical therapy often proves useful

then closed in layers The pathological findings disclosed that the uterus was enlarged and contained many small fibroids

The woman remained in the hospital for about fifteen days, during which time the doctor saw her daily and dressed the wound, and she made an uneventful recovery She paid the doctor's bill, and appeared perfectly satisfied with the treatment rendered

About one month later, she called at the doctor's office, and on examination the doctor found that she was in good condition She called again about two weeks thereafter, complaining of artificial menopause On this occasion, the doctor prescribed ovarian extract

Shortly after this, the doctor went to Europe, and when he returned about two months later he was served with a summons and complaint In her complaint the plaintiff charged that she employed the defendant to remove an outgrowth or obstruction or tumor which had grown or was contained in the uterus, and the defendant agreed to remove the same, but in violation of his agreement he removed or caused to be removed her uterus or other vaginal parts, and that said removal was wholly unwarranted and not in accordance with the terms of the agreement of employment between the plaintiff and the doctor, and that the operation was performed in an unskillful and negligent manner, as a result of which it was claimed that the plaintiff would be unable to bear children Damages were prayed for in the sum of $25,000

After the doctor's answer had been interposed, the plaintiff failed to take any further steps in the matter, and subsequently a motion was made to dismiss the action for the plaintiff's failure to prosecute the same The said motion was granted, and the matter thus terminated in the doctor's favor

---

CLAIMED OPERATION WITHOUT CONSENT

In this case the complaint charged that the plaintiff consulted the defendant, a specialist in diseases of the ear, nose and throat, and requested the defendant to give him certain professional advice with respect to the removal of wax from the ears of the plaintiff, which plaintiff had been in the habit of having done periodically theretofore, and that during the course of the examination, the defendant examined the ears, throat and then the nose, stating to plaintiff that these organs were co-related in their functions, and plaintiff thereupon consented to an examination of his nose by defendant, that while plaintiff's nose was being examined, the defendant wrongfully and negligently, and without permission from plaintiff broke off and extracted certain bones from the nose of plaintiff, causing plaintiff's nose to become distorted and unshapely and disfigured, and that as a result of this operation, the plaintiff lost the sense of smell, and suffered continually from headaches, and his eyesight became impaired and that he also suffered great anguish of body and mind and became extremely nervous and irritable, which interfered with his ability to carry on his vocation and business, resulting in his great financial loss Damages were prayed for in the sum of $50,000

The patient and the defendant were fellow-members in a social club, and one day the plaintiff complained to the defendant about a condition of his nose which he said had been of long standing, and asked the defendant if he would treat him. The doctor told him to come to his office, which the plaintiff did, and upon examination the doctor found that he had catarrh of the nose, throat and middle ear and a fullness in the Eustachian tube, and the doctor told him that in the treatment which he was about to render, he would remove a small portion of each middle turbinate The patient consented, and thereafter the doctor administered a local anesthesia of novocaine, and with his Douglas snare removed a small portion of each middle turbinate. The patient remained in the doctor's office after this for about five hours, when his wife came and took him home The patient came back on five occasions, when the doctor cleaned out his nose with a two per cent solution of silver nitrate, when the doctor discharged him

The doctor subsequently sent the patient a bill which was never paid Instead, the patient began the action for malpractice Repeated requests were made by the plaintiff's attorney prior to the trial for a settlement, all of which were refused by us, and the case finally came to trial The jury was selected one afternoon, and the case adjourned to the following morning when the taking of testimony was scheduled to commence The next morning, however, the patient's attorney came to court and said that he believed that he had been misled on the facts of the case, and requested the court's permission to discontinue the action This was accordingly done, thus terminating the matter in the doctor's favor

LEGAL

By Lloyd Paul Stryker, Esq.
Counsel, Medical Society of the State of New York

GEORGE BERNARD SHAW CONSULTS A DOCTOR

One of the most salable commodities in the field of literature is destructive criticism Of late years the iconoclasts have had an unprecedented vogue among the reading public

For many years Mr George Bernard Shaw has been amusing himself and delighting a large public by strictures upon the medical profession "The Doctor's Dilemma" and many other of his books and essays concern themselves with an attempt to show that the medical profession is entitled neither to the respect nor the confidence of the community Within the past few weeks in *Time and Tide* he amused himself with satirizing the physicians who brought King George through his recent critical illness In this article he said that when the King reached Bognor, he would improve, "not because of the fact that he would get fresh air, but because he had escaped from the doctors"

During the very time when he was composing this article he himself was ill "It is, perhaps, somewhat ironical to note," says the Daily News, "that during the time Shaw was writing his playful satire on the King and the doctors, * * * he was already sickening The sting in his article in *Time and Tide,* as in most of what Shaw writes, was in the tail, when he said the King would get better at Bognor, not because of the fact that he would get fresh air, but because he had escaped from the doctors" Now we are informed that Mr Shaw is suffering from an illness characterized as "something much worse than an ordinary attack of influenza" His condition caused serious concern to his wife and filled his intimate friends with grave anxiety As to his views upon the medical profession, Mr Shaw like many another prophet, is not without honor save in his own country, for it appears that Mrs Shaw believes firmly in doctors and their ministrations Despite the great man's resistance to the calling in of medical practitioners, Mrs Shaw it seems called in not only a doctor of medicine, but a radiographer as well

What Mr Shaw thinks about anything is, in the writer's opinion, a matter of minor importance Especially is this true of his opinions of the healing art and of its recognized practitioners It is of interest, however, to note that this great exponent of medical skepticism when in real need, like the rest of us ordinary mortals, called in or permitted to be called in a doctor to advise and to treat him The quality of sincerity animating all of his previous strictures is thus open for inspection All those who profess attachment to the perfect efficacy of diet, drugless healing and other fancies of the day, should be interested in Mr Shaw's predicament. There are few men, we dare say, however vocal their disparagement of the medical profession who would not gladly seek and welcome its scientific ministrations when the hour of need has come

---

CLAIMED NEGLIGENCE IN SUPRAVAGINAL HYSTERECTOMY

In this case, the plaintiff, a married woman about forty years of age, came to the office of the defendant, a specialist in gynecology and obstetrics She had one child about ten years of age, and there were no miscarriages, abortions or pregnancies in ten years She gave a history of having pain in the abdomen and severe backaches over a period of two years She also complained that during the past two years she had excessive flow at her monthly periods The periods lasted four to five days, and during the first two days the flow was moderate Then usually on the third day the flow was very profuse, and diminished on the fourth day, and ceased on the fifth During the first two days of the period, the patient felt miserable and was nauseated.

The defendant gave her a thorough physical examination, and made a diagnosis of fibromyomati uteri The doctor advised an operation. The woman consented, and went to the hospital a short time afterwards At the hospital, under a general anesthetic the defendant performed a supravaginal hysterectomy, with left salpingo-oophorectomy The operation was performed by making a median incision below the umbilicus The peritoneal and abdominal cavity was opened, and the uterus pulled out of the wound The broad ligaments were ligated, the bladder reflection was separated, and the uterus was removed by a typical supravaginal hysterectomy The left tube and ovary were removed. The edges of the broad ligaments were sutured and united, and the mucosa of the stump of the cervix was cauterized, and the stump closed The abdomen was

then closed in layers The pathological findings disclosed that the uterus was enlarged and contained many small fibroids

The woman remained in the hospital for about fifteen days, during which time the doctor saw her daily and dressed the wound, and she made an uneventful recovery She paid the doctor's bill, and appeared perfectly satisfied with the treatment rendered

About one month later, she called at the doctor's office, and on examination the doctor found that she was in good condition She called again about two weeks thereafter, complaining of artificial menopause On this occasion, the doctor prescribed ovarian extract

NEWS NOTES

PUBLIC RELATIONS COUNTY SURVEY, No 4—ONEIDA

When our Committee was first appointed in 1928, we sat back and waited for a situation to arise that would need our assistance to iron out The months slipped by without any problem being put up to us and we decided to initiate some contacts with the lay organizations in our County Through the good offices of Dr George M Fisher, who had on his own request been made a member of the County T B Council, we met with the executive members of the T B Council and established cordial relations with them We found that the T B Clinics were being conducted by men brought in from outside the County It was not difficult to persuade the Council that we had doctors in our own community fully competent to do this work By bringing the matter to the attention of the County Medical Society, the health officers of the various towns readily assented to the plan The T B Council also asked us to suggest in what direction their program could be enlarged After conferring with the officers of the County Society, we asked the Council to help us in putting over a Periodic Health Examination Campaign this year This they have agreed to do

In November we were startled out of our lethargy by the District Health Officer notifying us that two women had arrived in the County from the State Department to make a survey of the County "to secure a list of *all* physically handicapped children under twenty-one years of age and the nature of their disability regardless of the financial condition of the family, that steps would be taken to aid those in need to as complete a correction as possible, and that they might be given an education either in school or at home and prepared for some useful occupation within their ability to perform" The physicians were invited to assist by turning in "a list with name, age, address and parent's name of *all* physically handicapped children of whom they had knowledge, whether or not they were under their care or had received treatment of any kind" We at once registered our resentment with the chairman of the Public Relations Committee of the State Society while arranging to aid in the survey with such limitations as naturally suggest themselves to any practicing physician We also were able, later on, to send our objections to such a survey, to the State Department through one of their own officers (Dr Fleming), as well as through a lay member of the State Advisory Board for Crippled Children Our objections were well received by the Department as was evidenced later by their calling in the Public Relations Committee of the State Society for advice in regard to matters affecting the physicians of the State.

Some three years ago the County Medical Society, realizing that Oneida County had many cases of Incipient Tuberculosis, appointed a so-called Tuberculosis Committee to consider the situation This Committee had several meetings with a Committee from the Board of Supervisors, heads of various hospitals in the County and the heads of various welfare organizations to decide whether a hospital was needed. The Committee made a canvass of the reported cases of Pulmonary Tuberculosis during the past year and by their figures convinced the joint Committee that some means should be taken to care for these incipient cases that are reported each year The Board of Supervisors also was convinced and means were taken to provide a hospital

The Committee appointed by the Chairman of the Board of Supervisors from that body to plan and construct such hospital consisted of two physicians who are members of the board In addition, the President of the County Society was invited to go with them to inspect various hospitals to get an idea of modern hospital construction The special committee of the County Society also inspected some fifteen different sites for the hospital in the County, and while their first choice was not accepted because of its distance from the cities of Utica and Rome, it all goes to show the spirit of co-operation which exists between the County Society and the Supervisors

Recently a Board of Managers for the new County T B Sanatorium has been appointed by the Supervisors This Board of five contains two doctors, both ex-presidents of our County Society, and another member is a doctor's widow, who was the Superintendent of one of our Hospitals

The Director of the Utica Visiting Nurse and Child Health Association, which is a very active organization, conducting clinics for prenatal cases and babies, as well as providing nursing care and health instructions in the home, is Dr Andrew Sloan, a member of the State Society Committee on Nursing Not only is this Association doing a great piece of Public Health Work, but it is careful to see that their charity is not abused, and further, that the nurses employed are not assuming the functions of the doctor Only recently the Association invited the chairman of the Public Relations

Committee to become a member of their Medical Advisory Board

Since the Rotary Club first inaugurated its work for crippled children in this County, it has had, as director, one of their own members, Dr Hume Baldwin, who has guided them wisely and well The doctors doing this work have always been compensated (perhaps modestly) for their work

I think enough has been said to show that our doctors are in close touch with the Public Health activities in the County With the stimulus furnished by the Public Relations Committee of the State Society and the editors of the Journal, we are in a position to take an ever increasing leadership We may fairly claim to be functioning along the lines laid down by the Public Relations Committee as published in the Journal, and even thus early our eyes have been opened to the great possibilities that lie before us and to how readily the lay people as a rule, welcome our co-operation and yield to our guidance

J N FARRELL

THE RURAL PHYSICIAN IN PUBLIC HEALTH WORK

The mimeographed Bulletin of March 15 issued by Dr F W Laidlaw, District State Health Officer for the lower counties on the West side of the Hudson River, sets forth the responsibility of health officers toward public health projects Since nearly all rural health officers are practicing physicians, many of them being the only available doctors, the article will apply to all rural physicians—and also to city doctors The Bulletin reads

"The Village Board of Trustees of Monticello, last Monday evening voted an appropriation of $20 00 for each physician who assists in a series of diphtheria prevention clinics which the Health Officer, Dr Benjamin Abramowitz is planning to begin next month

"This is the result secured by Dr Abramowitz presenting the project as a matter of vital public importance, and as such properly to be paid for by public funds

"We have been asked by health officers (not recently, however), 'Do I have to do this T-A work?'

"We wish to say most emphatically, in the present state of our knowledge of what can be done in the prevention of diphtheria, that when the disease occurs in a district where little T-A work has been done, a tremendous personal responsibility rests on the health officer It has been demonstrated in all sorts of places—rural communities, small villages, large villages, and cities, that plenty of assistance can be secured, and that T-A work can be done to an extent which will afford real protection, without any undue expenditure of time on the part of the health officer

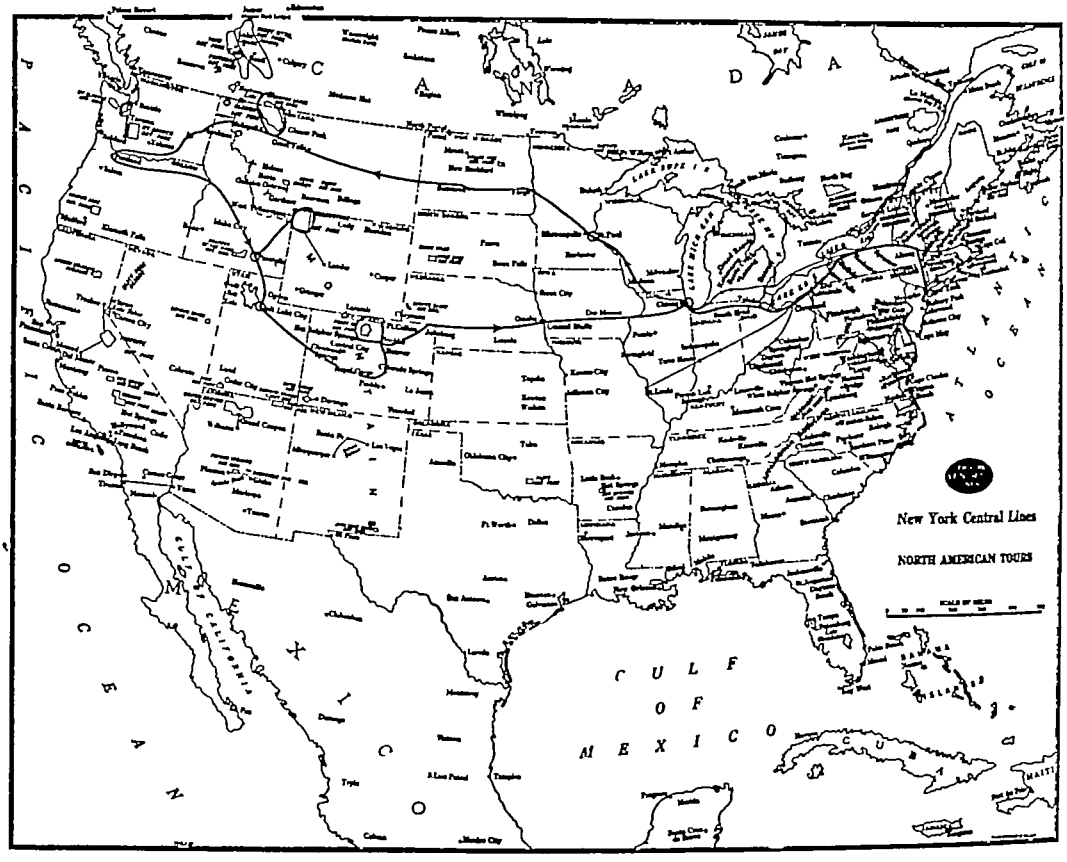
"The most important element is the determination on the part of the health officer to give to his district the benefit of modern science along this line.

"Don't let any State Medicine notions interfere with your determination When Billy Jones is protected against diphtheria, more protection is given than that which Billy Jones receives—what about those to whom Billy Jones might communicate diphtheria? In short, public protection is afforded

"Physicians should not be asked to contribute their services, but should be paid from public funds In this district the physicians have been most generous in contributing their services for demonstrating what could be done in diphtheria protection Demonstration is no longer needed and the work from now on should be on a business basis

"There are people in your district, wherever it is, who will be glad to assist in a worth-while matter Get them started now, so as to begin clinics next month It will take no more of your time to treat 200 children than it will 50, provided you have a systematic and properly managed clinic

* * * *



"Obstetrics practice should be better Talk this over with your professional friends—not that the State Department of Health is pointing out the shortcomings—but that the figures show that too many deaths occur in connection with this branch of practice All of us who are doing, or have done, obstetrics know that many of these deaths are from preventable causes Consider the matter of haste alone.

"This is a subject for the consideration of health officers The minute you have convinced yourself of this, a big step in advance has been made

"Expectant mothers should consult a physician and be under observation during the period of pregnancy If your public health nurse is not able to induce expectant mothers to do this, she is falling down on her job—and you are too, for you are directing her We know all about the argument that the physician is not interested—employ one who is interested—the medical profession climbs on the band wagon with the same alacrity as other people

"Altogether too many health officers look upon Prenatal and Child Welfare work as matters outside of their domain, and are willing to let nurses and welfare organizations work at the subject without the manifestation of any interest on the part of the health officer If Prenatal and Child Welfare work is being done and no reduction of rates can be shown something is wrong"

SPECIAL TRAIN TO THE AMERICAN MEDICAL ASSOCIATION

Map of the Itinerary of the Special A.M A Train

The Medical Society of the State of New York is arranging a special New York Central Railroad train from New York to Portland, Oregon, and return, for the benefit of physicians who expect to attend the annual convention of the American Medical Association on July 8-12, in Portland The train will be available for the families and friends of the A M A delegates and other physicians who expect to attend the Convention The start will be from the Grand Central Railroad station on Sunday, June 30, but passengers will be received at Poughkeepsie, Albany, Utica, Syracuse, Rochester and Buffalo The trip will last until Wednesday, July 24, when the return train will arrive in New York City

The map accompanying this article will give one a general idea of the route to be followed and the places to be visited

The cost of the tour will range from $400 to $500, according to the accommodations that are selected

The Committee in charge of the arrangements consists of Dr John A Card, Poughkeepsie, and Dr Arthur W Booth, Elmira

The New York Central Railroad has prepared a special folder giving full details of the trip A copy of this folder may be obtained by writing to Mr J S McAndrew, City Passenger Agent, New York Central Railroad, Room 1261, 466 Lexington Avenue, New York, N Y

A summary of the itinerary is shown in the following table

Arrive	*Remain*
Chicago, July 1	1 day
Glacier National Park, July 3	3 days
Portland, July 7 (leave July 12)	6 days
Yellowstone National Park, July 14	4 days
Salt Lake City, July 18	1 day
Denver and Rocky Mountain National Park, July 20	2 days
Omaha, July 21	
Chicago, July 23	
New York, July 24

DUTCHESS—PUTNAM

A meeting of the Dutchess-Putnam County Medical Society was held on the evening of March 13, in the Nelson House, Poughkeepsie, with the President, Dr C Knight Deyo, presiding, and fifty members present Officials of the local Department of Water Supply, and of the State Department of Health were guests

The entire program of the evening was devoted to the water supply of the City of Poughkeepsie The speakers included Mr George Krieger, County Engineer, Mr Walter E Walker, Superintendent of the Water Works, Dr Clarence O Cheney, Superintendent of the Hudson River State Hospital, Dr W H Conger, Health Officer of Poughkeepsie, Dr John A Card, Speaker of the House of Delegates of the Medical Society of the State of New York, and Dr James E Sadler, past-president and now Chairman of the Public Relations Committee of the State Medical Society

The occasion for the emphasis on the subject of water supply was an agitation for the installation of an upland water supply instead of the Hudson River which is used at present Poughkeepsie is confronted with the universal problem of reconciling the disposal of its waste water and sewage with the purification of the water that is delivered to houses The arguments presented at the meeting were three-fold

(1) If the Hudson River were not polluted with sewage, the purity of its water would be suitable for household purposes with ordinary treatment

(2) The Hudson River now, and for twenty-three years, has been efficiently purified, even though it receives sewage from several cities and villages

3 The alternative that faces Poughkeepsie and other cities along the Hudson Valley is either to extend the water purification system, or to build efficient sewage disposal plants in order to prevent pollution from reaching the water The Medical Society supports both propositions, and its members also believe that an upland source of water would require the same purification that is now given to the Hudson River supply

The meeting adopted two resolutions

1 That the Society appoint a committee to prepare and support the proposition that the pollution of the Hudson River, and all bodies of water within the state used as water supply by any community, be curbed and eventually eliminated so far as possible

2 That the Society basing its judgment upon its information, investigation and experience, believes without qualification that the water supply to consumers from the Poughkeepsie Water Works is pure and absolutely safe for all uses, including drinking

The meeting closed with a buffet lunch

TIOGA COUNTY

A regular quarterly meeting of the Tioga County Medical Society was held on March 5 in the Ahwaga Hotel, Owego, with the President, Dr Leon S Betowski of Waverly, in the chair, and twenty members in attendance The principal subject on the program was the construction of a general hospital to be erected with funds raised by voluntary gifts The project was supported by Dr Harry R Trick, President of the Medical Society of the State of New York, Dr James E Sadlier, past-President, Dr Arthur H Booth, and Dr John A. Card, Speaker of the House of Delegates The arguments presented by the State Society officers were along the lines set forth by Dr James E Sadlier in his annual address before the Medical Society of the State of New York, on May 21, 1928, and reported on page 738 of the June 15 issue of this Journal Tioga is one of only four counties of New York State in which hospital facilities are not available The physicians of Tioga County are deeply interested in the plan to establish a hospital at Waverly, in the southwest corner of the county The Medical Society endorsed the campaign, which has been started to raise $300,000 for the Hospital An anonymous donor has provided the funds for conducting the campaign, which has been planned to start on April first A beautiful booklet entitled "Names that will live" has been prepared setting forth the cost of various memorials such as the operating room, the X-ray equipment, the nursery, and the diet kitchen It is expected that the separate rooms and outfits will be named after the donors by whom they are given

The committee has issued another booklet explaining the "what, why and how of the hospital," and outlining the methods to be followed The actual raising of funds will begin on April first with an opening dinner It will continue for ten days and will close with a victory dinner Lists of prospective givers have been prepared and will be distributed to volunteer workers, each of whom will be responsible for the names on the list.

The area to be served by the proposed hospital contains 30,000 inhabitants The hospital building will be three stories in height and will contain accommodations for 53 patients immediately, with provision for easy expansion

MEDICAL WARES

ADVERTISEMENTS

Reprinted from this Journal of March 1, because of misplaced lines

Advertisements are necessary in medical journals for several reasons They inform doctors where they may obtain supplies The increased sales resulting from the advertisements enable manufacturers to improve their products and widen their distribution, and to conduct research departments, many of which rival those of medical schools in equipment and quality of work

The service rendered by medical journals, like that by a physician, is both impersonal and personal The reading matter and news columns of a medical journal are impersonal They deal with matters of general interest and no contributor profits financially by the items On the other hand, the advertisers profit by the distributing service offered to them by the Journal They are the private patients of the Journal and expect to pay for what the Journal does for them

A medical journal, like a doctor in private practice, expects to supervise its patrons, to diagnose their conditions, to prescribe the remedies, and to assist in carrying out the directions

A medical journal may assume the attitude of a drug clerk and either hand out what a customer calls for, or say that the article is not carried in stock The Journal may reply to the advertiser, "No, we do not carry that kind of advertising," or it may take the attitude of a doctor to a patient, and say, "Your advertisement is sick or defective, but here is the way to cure it, and when its defects are remedied, we will accept it"

An advertisement in a medical journal is intended to impress physicians Its first essential is that it should be scientifically truthful in its statements Advertisers in their zeal search through medical literature and are usually able to quote statements that confirm their most optimistic claims But doctors expect each advertiser to state the truth without recourse to long words which make the advertisement read like the harangue of a negro preacher

The medical profession can influence advertisers best by editing their copy and showing them wherein their claims are exaggerated or false Most advertisers seeking admission to medical journals are honest and sincere in their efforts to conform to the wishes and standards of physicians, and they say, "How can we know the attitude of the medical profession unless doctors tell us that the quotations that we find in reputable medical books and journals do not represent the opinions of modern physicians?" It is surprising how many objectionable advertisements can be made acceptable by the change of a few words which do not affect the general style of the advertisement

Medical products whose advertisements are offered to medical journals may be divided into three classes

1 Those used by doctors only
2 Those used by both doctors and laymen
3 Those used by laymen only

There is seldom any trouble with an advertisement of an article used only by the medical or allied professions These articles are nearly always well written, scientific, and truthful, and are always acceptable to any medical journal

Advertisements of medical products sold to laymen only also give editors little worry, for they are rejected because they are written in the exaggerated style of the quack Practically all medical journals agree that cosmetics, beauty restorers, and patent medicines have no place in their columns

Advertisements of articles which are sold to both doctors and laymen arouse controversy principally because the manufacturers and dealers sometimes have one set of statements for doctors and another for laymen It seems to be a principle of advertisers in newspapers and magazines that the manufacturer who makes the best claims stands the best chance of selling his goods The standard of a medical journal is that an advertisement shall tell the truth without exaggeration

There is sometimes a question as to whether or not a product, such as that for external use, shall be considered a therapeutic agent If the use of a harmless plaster or ointment allays pain, soothes a part, or relieves distress of either body or mind, it is an ethical product according to medical standards, and its use by physicians is permitted But doctors object to the claim that a household remedy can cure any disease at all

Will manufacturers and dealers accept the advice of physicians and medical editors? Experience shows that they will welcome the suggestions of physicians and accept the editing which medical journals may require Advertisers have shown a spirit of cooperation in accepting the editorial printed on page 160 of the February first issue of this JOURNAL, and are offering their copy to be edited They also say that they will try to adopt the suggestions of the editors as they prepare copy for lay periodicals, so that their advertisements shall conform to one standard. To raise the standard of medical advertisements is in accordance with true med[illegible]rogress

THE DAILY PRESS

SEWAGE DISPOSAL IN NEW YORK CITY

The proposed Department of Sanitation for New York City was discussed on page 294 of the March first issue of this JOURNAL An argument for the new department is contained in the *New York Times* of March 18 which says editorially

"Never before in the history of the world have so many people been gathered together in a limited area as are to be found in this city today Yet New York is now practically the only great city which has no officially adopted comprehensive plan and policy of main drainage and sewage disposal The present system is to dump into the adjacent waters hundreds of thousands of tons of refuse. Most of this floats back and forth in the harbor and rivers

"These general statements, when backed by details drawn from the analyses made by experts, reveal a condition which is not only a disgrace to the city but an indication of a state of sanitary barbarism unparalleled in modern countries Even "backward" Orientals show greater care and wisdom in disposing of their refuse We take pride in our closed sewers and have no compunctions about dumping all manner of filth into our waters without even inquiring what becomes of it

"In fairness to the City Administration, it must be said that within the last few years a number of plants have been erected to screen sewage and to dispose of certain types of refuse But even the projected plants are inadequate to handle the growing quantities of waste from the increasing population No doubt it has been politically impractical for the City Government to obtain enough money to push a far-seeing plan The cost of installing the necessary system would be appallingly great Yet each year's delay means added expense"

New York City has been favored above all others in being surrounded by tide water, which can absorb an enormous amount of raw sewage But the time has now come when the capacity of the Harbor has been reached, and something will have to be done to prevent the waste matter from becoming a serious health menace New Yorkers like to be first in everything, and doubtless they will establish a modern system of sewage disposal as soon as an agreement can be reached among the districts of the city whose interests are separated as widely as are those of New York and Philadelphia.

THE CHILDS' RESTAURANTS

The management of the ubiquitous *cafes des enfants,* as they would be called in Paris, has been changed as a protest against the ten-year old policy of printing calories and vitamines on the menus and of giving menus composed of what the proprietors think the patrons should order Empty chairs and dwindling receipts have resulted in the restoration of popular dishes and the abolition of ratings of calories and vitamines with which Mr Childs has tried to educate the people The *New York Sun* of March 18 commenting on the new order of menus, says

"The big idea now is that what a customer of Childs wants most is something to fill up on rather than a lot of statistics, a bit of bran and a sprinkle of lemon juice The new proprietors intend to serve rich, rare meat dripping with succulent gore, fat bacon or lean, as the taste demands, pork in all of its fascinating styles, veal, lamb, chicken, duck, fish and various intriguing combinations, such as stews, patties, escallops, fricasees and hashes "To hell with spinach! Give em red meat!" That apparently, is the new motto

"And business has boomed For the last six weeks or two months they have gradually been restoring meat items and eliminating various odds and ends of goat nourishment. Day after day trade picked up until, in the last few weeks, they have gone away ahead of the business that was done over a similar period last year Today they canned the chemical formulas and the algebra on the menu cards as the final stroke of reform, and topped it all by adding at least two vegetables to every meat dish for one and the same price

"It did not require a great deal of thought to perceive that most people who went into a Childs restaurant did not give a hang how many calories or vitamines they ought to absorb What they were concerned about was how much good, rare roast beef could they get for a reasonable price, or how big a portion of chicken or fish, or whatever else they wanted, could be had for their limit

"New York won't stand for fads when those fads interfere with its comfort People who insist on sticking to fads lose out Our business had dropped off materially because of faddism We have cut it out and business is booming"

PUBLIC HEALTH NURSES AND PRIVATE DOCTORS

The fourth annual New York Health Conference, meeting in the Hotel Roosevelt, New York, on March 15, discussed the nursing demonstration conducted by the Milbank Fund in the east central part of Manhattan Borough The *New York Times* of March 15 says

"Commissioner Wynne suggested that the Health Department and the Bellevue-Yorkville health demonstration, which is being financed by the Milbank Memorial Fund, jointly place a staff of nurses at the disposal of doctors and dentists in the demonstration district These nurses would work solely for the benefit of the physicians They would visit patients, instruct them in disease prevention and furnish that supplemental service which the physician may be unable to give in his office If the experiment is a success, the doctors would take over the responsibility of the work themselves, said Dr Wynne He expects to begin planning for the new agency shortly

"'Health agencies have been too prone to criticize the private doctor when he is doing all he can, with fees of $1, $2 and $3,' said Dr Wynne 'How can we expect him to maintain a staff of nurses to do follow-up work in the homes of his patients to see that they observe the laws of health? No health organization would think of launching a campaign against diphtheria or tuberculosis for instance, without organizing a staff of nurses to bring in people for immunization or examination There we must not expect more of the private physicians The situation can best be met by placing a staff of nurses at the disposal of the private doctors and dentists Give the physicians a chance and I think they will work with us in our efforts to control sickness and prevent disease.'

"In this connection he advocated the organization by the practitioners of pay clinics to be operated and maintained by the County Medical Society and the Department of Health

"If the doctors do not meet this situation themselves, the public will demand that the State supply the service required, for, after all, the preservation of health is a direct responsibility of the State"

CURATIVE AND PREVENTIVE MEDICINE

The *New York Times*, of March 15, commenting on an address by Dr Theobald Smith before the Health Conference in the Hotel Roosevelt on March 14, says editorially

"Public health agencies are concerned with mass phenomena and record their progress by statistics, whereas the physician deals with the individual and is not helped by the fact that 95 per cent of the operations for a particular ill are successful That does not tell him whether the case in hand belongs to the 95 per cent or the 5 per cent Experiments assume a certain uniformity, while practice has to contend with complications The conclusion is that each needs the other as a corrective and that they must work together They are the "two wings of medicine," and each is essential to the other in functioning for the community good Not only must the accidents and infirmities of the moment be looked after, but there must be a peering ahead to avoid what is approaching This conference of the medical practitioners and the workers in the public health organizations is a hopeful symptom, for both are essential to the community"

SELF-MADE MEN

Born healers may well take notice of the following comments on self-made men in a sermon by the Rev Harry Emerson Fosdick reported in the *New York Herald-Tribune* of March 18

"He had nothing to do with inventing steamships, railroads, telegraphs, telephones He never lifted a finger to build the democracy that gave him his chance, the public school system that gave him his education, the orderly society that left him free for peaceful pursuits, or the credit system that has underlain his business

"If he loves music, somebody else composed it. If he loves art, somebody else created it. If the influence of religion has directly or indirectly brought him any peace or moral strength, that was a free gift from long ages of other people's sacrifice Our self-made man is like an author who would recognize no book in his library except of his own writing In such an attitude one might find vigor, strenuousness, self-confidence, but one certainly would miss something The wise author sees that what he has written is very small, and what has been written for him is very great, and so there comes to him humility, appreciation, reverence, gratitude, and the sense of something that he must try to live up to"

BOOK REVIEWS

DISEASES OF INFANTS AND CHILDREN By HENRY DWIGHT CHAPIN, A M, M D, and LAWRENCE THOMAS ROYSTER, M.D Sixth rev Edition Octavo of 675 pages, illustrated New York, William Wood & Company, 1928 Cloth, $7 50

This work first appeared in 1909 written by Dr Chapin and Dr Godfrey Pisek. The present is the fifth edition, and the junior author is Dr Lawrence Thomas Royster of the University of Virginia. This change in the association of the authors was occasioned by the death of Dr Pisek, since the publication of the previous edition. While the present one is larger in size than the preceding editions, it still remains a one volume work of moderate size, which in order to cover the wide field of pediatrics is necessarily condensed in its text. The penalty for condensation, of course, is the inability to devote quite as much space to important subjects as might be desired. This treatise has always been noted for its wealth of illustrations and for the concise method in which the technic of the various procedures is explained During his lifetime Dr Pisek was greatly interested in demonstrating the actual technic of the different measures of treatment and use. Not infrequently, at the New York Post Graduate Medical School and Hospital, he would devote a lecture or series of lectures to the practical and technical side of Pediatrics Even in its enlarged form, this volume still properly holds its place between a quiz-compend on one hand, and a reference work on the other

WM HENRY DONNELLY

SURGICAL DIAGNOSIS IN TABULAR OUTLINE FOR STUDENTS AND PHYSICIANS By DR. A J CEMACH Authorized translation by EDWARD L BORTZ, M D Large octavo of 109 tabular forms and 129 plates Philadelphia, F A. Davis Company, 1928 Cloth, $12 00

This work is an index of surgical diagnosis It has entailed considerable work on the part of the author, which is evidenced by the twelve pages of references from which this meat of knowledge has been selected. The contents are arranged in tabular outline, similar diseases being placed in parallel columns In this manner the salient factors in differential diagnosis are presented in such a way that they can be seen at a glance, thereby saving much time, and making it desirable for the surgeon and quite necessary for the general practitioner There are 109 of these tabular forms covering 548 subjects and opposite each form, or on the succeeding pages are plates containing the necessary figures and clearly illustrating the differential points of the respective diseases The regions are presented in an orderly manner First, surgery of the skull and contents, which is quite complete. Following this is surgery of the face, jaw, salivary glands, etc Then, swellings of the neck are given in detail, clearly differentiated and well illustrated. Next in order is surgery of the vertebral column, thorax and mammary glands. Then, the important subject of abdominal diseases is well reviewed and no less thorough is the section devoted to genito urinary diseases That part of the outline devoted to fractures of the extremities and pelvis is quite complete. So thoroughly treated is each subject of the outline that there does not seem to be any one predominating section. Its usefulness as a quick and instructive reference, I think is made manifest, and proven by the fact that it has passed through four, and is now in its fifth edition in German and is the only book of its kind in the English language This book certainly deserves its place among those used for desk consultation.

W GORDON FLICKINGER.

THE DIARY OF AN AMERICAN PHYSICIAN IN THE RUSSIAN REVOLUTION, 1927 By ORRIN SAGE WIGHTMAN, M.D Octavo of 230 pages, with 52 full page illustrations Brooklyn, N Y., Brooklyn Daily Eagle, Commercial Printing Department, 1928 (Privately printed.)

This book consists of a series of incidents and impressions, such as one would relate to a friend after a journey to a far-off land. It pictures Russia as seen with the eyes and brain of an alert American physician, whose travels were speeded by his commission as a Red Cross Major, but who otherwise was thrown upon his own resources Dr Wightman saw Russia as a trained photographer, than which there is no better school of observation. His photographs and his word pictures are equally expressive and striking

The diary relates the author's observations during his three months' stay in Russia, beginning on July 26, 1917, with his landing in Vladivostok, his trip across Siberia, Petrograd and Moscow, down the Volga River to Odessa, and at the Roumanian battle front, and back to Moscow and his return to Vladivostok. The book deals with the people seen from railroad trains, in restaurants and hotels, in amusement places, and at work in the field or in Army camps The philosophy and psychology of the people is summed up on page 91, which says, speaking of Tolstoi, "The negative phase of his teaching has taught many of his followers never to do anything to help in the progress of the world, but everything to block it. Go in the way of least resistance, the easiest way, and woe to the man who tries to stop you."

The diary will give the reader the same impression that he would get if he travelled through Russia.

HEALTH AND PLEASURE RESORTS OF CENTRAL EUROPE. Describing the Natural Mineral Water Sources and Their Therapeutical Indications. By MORRIS SCHOTT M D 12mo of 172 pages New York, The Author, 1928

It would seem to an unbiased observer that while the medical profession, as well as the lay population, of Europe gives too much consideration to, and lays too much stress on, the role played by hydrotherapy, on the other hand, in America the other extreme exists with almost a total neglect of this phase of treatment. We have been obsessed with the importance of focal infection in the causes of many diseases, especially those of the rheumatic family, and in the endeavor to cure numerous disease conditions by the removal of the focus of infection, we have neglected both medicinal treatment and hydrotherapy It would seem as though a middle path would be more sensible and that the combination of these various forms of treatment might easily prove to be more efficacious than the use of any single one alone. Dr Schott is a man whose name is intimately associated with hydrotherapy and he has compiled a hand-book of resorts in central Europe where mineral waters are used for the correction of bodily disfunction. Only a page or two is devoted to each spa, giving the altitude, the active season, source, and mineralization of the waters together with the indications and contra-indications for their use. It may be that the benefit which appears to be derived from this treatment is, in a large part, due to the regime, both dietetic and physical Nevertheless, it would seem that at least some virtue must lie in the external and internal use of the mineral waters and that we might do well in this country to devote a little more attention to this phase of therapy

WM HENRY DONNELLY

ANSWERS TO QUESTIONS PRESCRIBED BY NURSES' STATE BOARD By ROBERT B LUDY, M D Edited by EDGAR S EVERHART, M D, and J CLARENCE FUNK, M A, Sc D Octavo of 498 pages Philadelphia, David McKay Company, 1928 Cloth, $3 00

Dr Ludy's books are well known to candidates appearing before state licensing boards, as he has already compiled state board question and answer manuals for medical, dental and pharmaceutical students The present volume should serve a similar useful purpose for nurses It is complete and up-to-date All jurisdictions are included and questions as late as 1927 are answered. The book should serve a useful purpose in informing nurses as to what type of questions may be expected and how they should be answered

FREDERIC DAMRAU, M D

CONSTITUTIONAL INADEQUACIES An Introduction to the Study of Abnormal Constitutions By NICOLA PENDE, M.D Translated by SANTE NACCARATI, M D Octavo of 270 pages Philadelphia, Lea and Febiger, 1928 Cloth, $3 50

Our medical forefathers were greatly given to a consideration of types of individuals, of diatheses, which determined to a large extent the diseases to which persons falling into these groups would be subject With the advent of cellular pathology and of bacteriology, the individual was largely forgotten in an enthusiastic consideration of the external factors, in a study of the things that could happen to a patient. In other words, hereditary traits were largely disregarded in the interest bestowed upon environmental influences There has recently been a growing reversion to the earlier interest in the individual This study is called "biotypology" and Pende is its prophet. True, he was preceded by de Giovanni and by Viola, whom he calls his masters, but no one has so broadened the subject and brought it, not only up to date, but in the opinion of a somewhat conservative reviewer, a considerable distance into the future A number of his statements are still to be proved We are told of two main types of people—the broad of belly and short of limb, and the long legged folk with narrow trunks These are subdivided according to endocrinological studies and typed with reference to the sensitivity of the sympathetic and parasympathetic systems The psychopathological tendencies are included in the survey Such an analysis is supposed to reveal how any given individual should look, feel, act, and become sick, and there is little doubt that Pende and his co-workers have become aware of tendencies that the rest of us would do well to note. In this country Dr George Draper has pointed out some important facts in this realm of the study of the constitution The growing importance of the subject is evident. One tendency of the pioneers in this work that seems likely to hinder its popularity is the multiplication of new words The present volume appends a glossary of four pages of polysyllabic curiosities, all of which are defined in a few simple words, and most of which might well have been omitted in the text, in favor of the few simple words which tell their meaning Some of these words are coined by the author as improvements on the three or four synonyms recently put forth by other students of the subject

T H

THE PROBLEM CHILD AT HOME A Study in Parent-Child Relationships By MARY BUELL SAYLES Octavo of 342 pages New York, The Commonwealth Fund, 1928 Cloth, $1 50

One more book is added to the flood of publications on child psychology The book is based upon the study of some 200 records drawn from the clinics conducted for a five-year period under the Commonwealth Fund Program for the Prevention of Delinquency

The text is divided into three main parts, the first is on "The Emotional Satisfactions Which Parents and Children Seek in One Another" The second is on the "Mistaken Ideas Which Influence Parent-Child Relationships", and the third deals with narratives or case descriptions, illustrative of various types of child problems It would seem from this work, as well as from many others of like nature, that mistaken parental attitudes are a large factor in abnormal behavior in childhood. The author states that, strictly speaking, proof that in any instance a father's or mother's behavior is responsible for a child's behavior cannot be furnished, since scientific and fully controlled experiment in this field is obviously impossible. All that can be done, is to bring forward examples typical of the great number of cases which would seem to demonstrate that a casual connection exists

Publications on "Child Psychology" appear at such a rapid rate that the average medical practitioner is rather overwhelmed and finds it difficult to keep pace with the situation It is to be hoped that the mass of literature now appearing will not discourage the true seeker after light on "Child Psychology" This book seems to be very sensibly and clearly written and the statements contained in it are quite conservative, and in accordance with the evidence produced

WM HENRY DONNELLY

PRACTICAL SURGERY OF THE ABDOMEN By GEORGE H JUILLY, M D 2 Volumes Octavo of 1275 pages, illustrated Philadelphia, F A. Davis Company, 1928. Cloth, $16 00 net.

These two volumes offer a course in anatomy, physiology, surgical anatomy and surgery

The tyro, as well as the practised surgical technician, will be delighted with the completeness, the clarity, the simplicity and accuracy of the text. To the armament of the tyro will be added confidence

While Dr Juilly's recommendations are generally reasonably conservative, never too conservative, at times he seems a bit radical In many ways, there stand out the personality of the author, his psychology, his extended clinical experiences, his vivid descriptions, which with ample illustrations, original sketches, never fail to carry one through the difficulties of technique.

Diagnosis is adequately considered and a preoperative diagnosis insisted upon "for increasing the mental alertness and for training the surgeon and to prevent unnecessary laparotomies"

Practicality is an outstanding lesson—the author taking great pains to differentiate so that the reader may safely conclude between a surgical and medical condition

Not only in regard to pre-operative diagnosis does Dr Juilly uphold the American College of Surgeons, but he teaches that the surgeon should be first of all a well-trained general practitioner, an "all-around doctor"

It is most delightful to read the life-work of a surgeon of prominence who considers the "human body as a whole" and who disagrees with surgeons claiming "to know nothing of medicine," and who decries the exaggerated usefulness of certain self-styled "specialists"

Only such repetitions are made as are pleasurable in that they free the reader of constant references to various parts of the two volumes

Great emphasis is rightly placed on the fact that one should not open up an abdomen unless competent to handle any condition that may be found

J L. B

PREVENTIVE MEDICINE. By MARK F BOYD, M.D Third Edition Octavo of 475 pages, illustrated. Philadelphia and London, W B Saunders Company, 1928 Cloth, $4.50

This work presents pithily the salient features of modern preventive medicine. In it, the author has endeavored to impart the minimum knowledge of the subject which a medical student or practitioner should be expected to possess The material is authoritative and includes the recent discoveries

FREDERIC DAMRAU

TEXT-BOOK OF UROLOGY FOR STUDENTS AND PRACTITIONERS. By DANIEL N EISENDRATH, M D, and HARRY C ROLNICK, M D Octavo of 942 pages, illustrated Philadelphia and London, J B Lippincott Company, 1928 Cloth, $9 00

The authors are to be congratulated upon producing such an excellent single-volume textbook While the preface indicates its intended use for students and practitioners, every Urologist would do well to have a copy of it. The text is clear and concise and has the added feature of having all salient facts and headings in heavy type. One of the outstanding features is the great quantity of most excellent illustrations Those in black and white are particularly effective e.g, those illustrating varied types of injury to the kidney following trauma. Many striking and unusual features in Urological problems are presented The author appreciates the teaching value of the "word picture."

Very little space is given to the subject of syphilis, and properly so in a work of this kind The book should prove to be one of the most valuable in the field.

AUGUSTUS HARRIS

ESSENTIALS OF PRESCRIPTION WRITING. By CARY EGGLESTON, M.D Fourth Edition 16mo of 153 pages Philadelphia and London, W B Saunders Company 1928 Cloth, $1.50

This excellent little book fulfills the wants of the busy practitioner by giving him the necessary information to write a well balanced prescription.

Particular attention is given to the method of construction, dosage, and calculation of percentage solutions The indication for and the proper use of vehicles and coloring agents is considered so that liquid preparations may be made palatable and pleasing to the eye. The common forms of incompatibilities are briefly stated and if carefully studied one can avoid the usual pitfalls that make prescribed remedies unsightly, therapeutically inactive and ofttimes dangerous

F SCHROEDER.

AN INDEX OF DIFFERENTIAL DIAGNOSIS OF MAIN SYMPTOMS By Various Writers Edited by HERBERT FRENCH, C.B.E., M.A, M D Fourth Edition. Octavo of 1171 pages, illustrated New York, William Wood and Company, 1928 Cloth, $18 00

This encyclopedic volume of 1184 pages deals largely with symptoms arranged alphabetically in the main part of the book and in the index they are listed under the various diseases The index is full, comprising 300 pages Like the previous editions the book is a treatise on the application of differential diagnosis to the main signs and symptoms of disease, and it covers the whole field of medicine and its branches There is a tremendous amount of information brought into one volume making it a very valuable reference book.

W E McCOLLOM

EPILEPSY By WILLIAM G LENNOX and STANLEY COBB Octavo of 197 pages Baltimore, Williams & Wilkins Company, 1928. Cloth, $3 50 (Medicine Monographs, Vol. XIV)

This book is an excellent survey of the current opinion of the various schools of neurology regarding the different phases of epilepsy It is well written, carefully put up, and is thorough in every respect It does credit to its authors and merits a warm reception on the part of the general medical public. The reviewer agrees fully with the personal views expressed by the authors, and recommends the book to all who are interested in treating the sick, and particularly those diseases in which convulsions are commonly encountered

IRVING J SANDS.

CRITERIA FOR THE CLASSIFICATION AND DIAGNOSIS OF HEART DISEASE. By a Committee, HAROLD E B PARDEE, M.D, Chairman and others appointed by the Heart Committee of the New York Tuberculosis and Health Association, Inc. 12mo of 92 pages New York, Paul B Hoeber, Inc., 1928 Cloth, $1 50
